there are jurisdictional dams within FHN. Please consider addressing these features. Staff understands that these were reviewed with the original FHN development and approved by the State Dam.

typo. Please also include the intent for commercial development.

SITE LOCATION, SIZE, ZONING

The Flying Horse North project is 912.5 acres located near Black Forrest Road and Hodgen Road. As Illustrated in the Sketch Plan, the current zoning for the property is PUD. The property will serve as a continuation of the existing Flying Horse North developments. The parcel is currently vacant. The proposed PUDSP application submittal includes 1,571 new residential units, a luxury resort hotel with 225 rooms with assorted rental units, some commercial areas, and a potential fire station near Black Forrest Road and Hodgen Road.

TOPOGRAPHY

Please consider getting an official opinion from USACE regarding the wetlands.

The topography of the site varies from gently to moderately sloping generally to the northeast and southwest off a ridge line that bisects the site with some steeper slopes along drainages in the western portion of the site. The ridge line that bisects the site is associated with the Palmer Divide. The drainages on site flow in westerly and northerly directions through the property. No water was observed flowing in these the drainages at the time of this investigation, however, areas of ponded water were observed behind several earthen dams. Previous land uses have included grazing and pastureland. Flying Horse North Filing No. 1 has been mostly developed and the golf course has been completed. The site contains primarily field grasses and weeds in the eastern portions of the site with areas of ponderosa pine tree coverage in the western portions of the site.

HYDROLOGIC FEATURES/FLOOD HAZARD/FLOODPLAIN

There is little surface water on the site. Surface water is almost entirely derived from precipitation, consisting of runoff from snowmelt and surface flows from storm events. Proposed detention facilities will temporarily detain runoff onsite and direct it into existing natural ephemeral drainageways. As designed the intent is to avoid water pollution as the stormwater facilities should adequately address urban runoff into drainageways and ultimately water resources. These facilities will be designed to comply with local, state and federal guidelines. There are currently few riparian areas existing on the property. Development will increase riparian availability and diversity, providing additional wildlife habitat at the site. Creation of open space tracts along drainageways will ensure preservation of new riparian areas as well as promote access to these areas for recreation through trail systems. The property contains portions of floodplain in the northwest corner of the property near Hodgen Road. This development will avoid this floodplain and therefore no impacts will occur.

WETLANDS

The wetland assessment revealed that few of the features identified in the NHD and NWI data were present on site, with only the main tributary to Black Squirrel Creek generally matching the desktop review data. Based on the information obtained from the site reconnaissance, the wetlands present on the Project site, with the exception of one jurisdictional wetland associated with Black Squirrel Creek and permitted in 2017, are all isolated. Most of the tributaries depicted in the NHD and NWI data did not contain wetlands and were not tributaries at all. While only the U.S. Army Corps of Engineers (USACE) may determine the regulatory status of aquatic features under the Clean Water Act, it is the Environmental Engineers professional opinion that the field-delineated wetlands on the site would not be considered jurisdictional, minus the wetlands associated with Black Squirrel Creek.

SOILS

spacing error

The site was found to be suitable for development with appropriate mitigation and avoidance. Per the report by the Geotechnical Engineer, approximately 62% of the site is rated 'Not Limited' for dwelling with or without basements, while approximately 33% is rated 'Somewhat Limited', and the remaining 5% of the site, on the far western edge, is rated 'Very Limited' (NRCS 2022b). It is the opinion of the Geotechnical Engineer that the existing geologic engineering and geologic conditions will impose some constraints on development and construction of the site. The majority of these conditions can be avoided by construction. Others can be mitigated through proper engineering design and construction practices. The proposed development and use is consistent with anticipated geologic and engineering geologic conditions. This project will not interfere with the extraction of mineral deposits.

please consider adding an acknowledgement that a more site specific soils report will be required at a later stage of development as well as that specific plat notes may be required to mitigate constrained areas.

SCENIC RESOURCES & UNIQUE NATURAL AREAS

The Flying Horse North property has part of the Black Forest in the southwest area of the site. This area of the property has natural and scenic importance much like Cathedral Pines (south of Flying Horse North) and High Forest Ranch (north of Flying Horse North). This design locates the largest estate lots (2.5 acres) in this area to preserve as many trees as possible since it is a unique natural area.

WILDLIFE & MIGRATORY BIRDS

The Flying Horse North property does not have any significant environmental issues and there is no known threatened species on the property per the environmental report prepared by Bristlecone Ecology. The Flying Horse North site provides moderate quality habitat for some grassland and woodland wildlife, including birds, mammals, reptiles, and possibly amphibians. Development of the site could impact some habitat for wildlife, but based on the findings, impacts to grassland species is relatively low, and to woodland species as moderate to low. No state listed species were present in the property according to the report prepared by Bristlecone Ecology. Federally listed T&E species are not expected to occur on the Project. To alleviate any significant impacts to wildlife, larger 2.5 acre lots are proposed in the forested areas. Riparian tree plantings along drainageways will enhance and integrate the existing grassland habitats with high-value riparian ecosystems. The creation of detention facilities is expected to create small pockets of marshes/wetlands. Therefore, species that occur in drainageways are expected to benefit from the habitat restoration and management plan for the drainages and open space. Implementation of the stormwater management plan will assist in protecting water quality in the drainages. Additional measures to reduce impacts to wildlife include:

- Limiting the use of herbicides, pesticides, and fertilizers;
- Minimizing the installation of fencing; and when fencing is needed, use wildlife friendly fences or include specific wildlife crossings along fence lines.
- Minimize road crossings for the open space corridors to reduce conflict with vehicles.
- Managing pets to avoid conflicts with wildlife.

Please discuss potential impacts (in general terms) to: schools, fire, sheriff, roadways, utilities
