

HAY CREEK HULL SUBDIVISION

FINAL DRAINAGE REPORT

EPC PROJECT #: _____

ALL TERRAIN ENGINEERING PROJECT NO: 24008

NOVEMBER 2024

PREPARED FOR: 3405 HAY CREEK, LLC CONTACT: JAMIE HULL 3405 HAY CREEK ROAD

COLORADO SPRINGS, CO 80921

PREPARED BY: ALL TERRAIN ENGINEERING LLC CONTACT: NICHOLAS Q. JOKERST NJOKERST@ALLTERRAINENG.COM (530) 391-7635

ENGINEER'S STATEMENT

The attacked drainage plan and report were prepared under my direction and supervision and are correct to the best of my knowledge and belief. Said drainage report has been prepared according to the criteria established by the County for drainage reports and said report is in conformity with the master plan of the drainage basin. I accept responsibility for any liability caused by any negligent accts, errors or omissions on my part in preparing this report.

Nicholas Q. Jokerst, PE	Date
State of Colorado No. 59273	
For and on behalf of All Terrain Engineerir	ng LLC

DEVELOPER'S STATEMENT

I, the owner/developer have read and will comply with all of the requirements specified in this drainage report and plan.

Jamie Hull

I. General Purpose, Location & Description

a. Purpose

The purpose of this Final Drainage Report (FDR) for HAY CREEK HULL SUBDIVISION is to describe the site's onsite and offsite drainage patterns, existing and proposed storm infrastructure, and to safely route developed stormwater to adequate outfalls.

b. Location

HAY CREEK HULL SUBDIVISION, referred to as 'the site' herein, is in a portion of southeast quarter of Section 33, Township 11 South, Range 67 West of the 6th P.M., El Paso County, Colorado. The site is bound by Hay Creek Road to the north and single family residential parcels to the east, west and south. Surrounding platted developments include Hay Creek Ranch subdivision to the east. A vicinity map is presented in Appendix A.

c. Description of Property

The site is approximately 28.54 acres and includes a single family residence and barn. The remaining area of the lot is undeveloped land with existing vegetation consisting of native grasses. The approximate disturbed area associated with this project is 0.99 acres. The site is currently unplatted. The development will plat 6 single family residential lots. In general, the site slopes towards Hay Creek. Onsite elevations range from 6935' - 7114' with slopes ranging 1 – 50%. Per a NRCS soil survey, the site is made up of Hydrologic Type B soils consisting of Jarre-Tecolote complex and Type B Peyton-Pring complex.

Hay Creek bisects the site. Hay Creek is tributary to Beaver Creek to the east. There are on-site utility services to the existing residence, however; there are no on-site utility mains within the project's disturbance area. An existing, private 18" CMP private culvert is present within Hay Creek in addition to two bridge crossings.

d. Floodplain Statement

Based on FEMA Firm map 08041C0267G dated December 7, 2018, the site is Zone X and Zone A. Zone X are areas determined to be outside the 0.2% annual chance flood. Zone A (no base flood elevations determined) areas are determined to be within the 1% annual chance of flooding zone.

Portions of the proposed lots within the Zone A floodplain will be platted in a no-build easement.

The County has completed a "Base Line Engineering" (BLE) study of Hay Creek which used detailed methods to determine Base Flood Elevations (BFE's). The results of the study are considered the "best available data" but are not formally adopted by FEMA. The cross sections and BFE's from the BLE study are shown on the attached drainage map. Reference material from the BLE study are included in Appendix E.

II. Drainage Basins

a. Major Basin Description

The site is located within the Hay Creek Valley which is within the Beaver Creek Major Drainage Basin. There is no current DBPS for the site. Hay Creek discharges to Beaver Creek approximately a mile downstream of the site.

b. Existing Subbasin Description

In the existing condition, Hay Creek collects the site's stormwater and conveys it east towards Beaver Creek. See below for existing basin descriptions:

Basin EX1 is 9.89 acres of Hay Creek Road, a single residence and undeveloped land. Existing stormwater from this basin ($Q_5 = 2.9$ cfs $Q_{100} = 14.3$ cfs) flows into Hay Creek at DP1 ($Q_5 = 6.7$ cfs, $Q_{100} = 39.6$ cfs) and is conveyed easterly offsite.

Basin EX2 is 19.19 acres of undeveloped land. Existing stormwater from this basin ($Q_5 = 4.1 \text{ cfs } Q_{100} = 27.4 \text{ cfs}$) flows into Hay Creek at DP1 ($Q_5 = 6.7 \text{ cfs}$, $Q_{100} = 39.6 \text{ cfs}$) and is conveyed easterly offsite.

c. Proposed Subbasin Description

The proposed site has been divided into 4 subbasins for analysis. The site is being developed as a "Large Lot Single-Family Site". An imperviousness of 10% impervious is assumed for buildable portions of the lots. Nobuild areas are delineated on the plat and drainage map for areas within the Zone A floodplain. Generally, runoff is conveyed overland to Hay Creek which flows east and offsite. Per the County BLE study, Hay Creek conveys $Q_{100} = 311$ cfs through the site. The culvert at DP1 is sized per this flow. Q_5 and Q_{100} values below indicate that basin's contribution to the 311 cfs. See below for proposed detailed basin descriptions:

Basin 1 is 4.54 acres of Hay Creek Road, an existing barn, existing dirt driveways and undeveloped area. There is no proposed development or disturbance within this basin. Stormwater from this basin ($Q_5 = 1.5 \text{ cfs } Q_{100} = 7.6 \text{ cfs}$) follows historic drainage patterns to Hay Creek at DP1 ($Q_5 = 4.2 \text{ cfs}$, $Q_{100} = 21.7 \text{ cfs}$). A proposed, private twin 7'x3' reinforced concrete box culvert (RCBC) conveys DP1 flows under the proposed, private driveway to DP2.

Basin 2 is 10.07 acres of 5 acre single family residential lots and undeveloped area. Stormwater from this basin ($Q_5 = 2.9$ cfs $Q_{100} = 15.0$ cfs) sheet flows north and east per historic drainage patterns to Hay Creek at DP1. A proposed, private twin 7'x3' RCBC conveys DP1 flows under the proposed, private driveway to DP2.

Basin 3 is 5.35 acres of Hay Creek Road, 5 acre lots, a private driveway and undeveloped area. Stormwater from this basin (Q_5 = 3.2 cfs Q_{100} = 12.2 cfs) flows overland south and east to Hay Creek at DP2 (Q_5 = 8.6 cfs, Q_{100} = 41.3 cfs).

Basin 4 is 9.12 acres of 5-acre single family residential lots and a private cul-de-sac. Stormwater from this basin (Q_5 = 3.0 cfs, Q_{100} = 15.3 cfs) sheet flows north and east per historic drainage patterns to Hay Creek at DP2 (Q_5 = 8.6 cfs, Q_{100} = 41.3 cfs).

III. Drainage Design Criteria

a. Development Criteria Reference

The drainage analysis, proposed stormwater improvements follow the criteria from the "Drainage Criteria Manual of El Paso County, Colorado" Volumes 1 and 2, as amended (EPCDCM).

b. Hydrologic Criteria

Hydrologic data was obtained from NOAA Atlas 14 for the site location. Onsite drainage analysis included the 5-year storm (minor event) and 100-year storm (major event) using 1-hr duration rainfall depths from NOAA Atlas 14. Runoff was calculated per EPCDCM Chapter 5 – Storm Runoff Method of Analysis.

d. Hydraulic Criteria

Hydraulic criteria for culvert design was obtained from the EPCDCM Chapter 9 – Culvert Design. The U.S. Department of Transportation HY-8 Culvert Hydraulic Analysis program was utilized in culvert analysis.

IV. Drainage Facility Design

a. General Concept

Proposed improvements for the subdivision are limited to the proposed, private driveway, cul-de-sac and box culverts, which do not alter the site's stormwater discharge point. The remainder of the site will remain undisturbed and follow historic drainage patterns to Hay Creek until individual lots are developed. This drainage report assumes an imperviousness of 10% imperviousness for buildable lot area. If future improvements exceed the maximum 10% imperviousness threshold, an additional drainage report will be required to address the increase. The proposed imperviousness increase generates a minor increase in flow.

FLOW INCREASE SUMMARY												
BASINS	AREA	Q5-YR	Q 100-YR									
EX1 & EX2	29.08 AC	6.7	39.6									
1 - 4	1 - 4 29.08 AC 8.6 41.3											
Percent Increase 29% 4%												

The increase in 5-year and 100-year flows will have a negligible impact to downstream infrastructure or water quality. The increase in flow will be experienced on-site only as the time of concentration of the Hay Creek basin greatly exceeds the on-site time of concentration of 37.7 minutes. Hay Creek's time of concentration in this reach is approximately 2-hours. Therefore, peak flows leaving the site will be gone prior to the Hay Creek basin and creek flow peaks. Therefore there is no anticipated increase in peak 100-yr flows downstream of this site. Excerpts from an adjacent drainage report (Hay Creek Ranch) including Hay Creek Time of Concentration calculations have been included in Appendix E.

To address the minor increase in the site's stormwater flows on-site, onsite stormwater flows will not be concentrated and allowed to sheet flow across undisturbed ground. This approach will promote infiltration and thereby reduce runoff.

The proposed Hay Creek crossing will consist of a private, twin 7'x3' RCBC, sized to convey Hay Creek's 100yr peak flows, without causing a rise greater than 6" to the computed 100-yr water surface elevation. The culvert has a headwater to depth ratio of less than 1.5 and will include type L soil-riprap stabilization on the downstream end per the calculations included in appendix C. The upstream end will include a local

depression and concrete apron w/ cut-off wall to protect the inlet. Culvert calculations are presented in Appendix C.

This crossing is being coordinated with the Flood Plain Manager.

b. Water Quality & Detention

The site will not require water quality treatment as it is being developed as "Large Lot Single-Family Residential" lots with total imperviousness areas of less than 10%. These lots are excluded from water quality treatment per Section I.7.1.B.5 of the ECM. It is worth noting that the site design and restraints include large no-build areas centered on the creek and flood plain. This will guarantee that a large vegetated buffer will remain in perpetuity between proposed imperviousness from the future home construction and the creek/site outfall.

No detention is proposed for the site, as the site will not increase peak flows off-site or downstream. A negligible increase of 4% above historic rates for the 100-yr storm is anticipated on-site, however this increase equates to only a 1.7 cfs increase in 100-yr peak flows. The site naturally drains over-land to the creek from both sides and these drainage patterns will be preserved, therefore; flows are distributed across the entire creek frontage length prior to entering the creek (950 LF feet per side), this equates to only 0.0009 cfs per foot, which is indetectable and negligible. A 29% increase to 5-yr peak flows is anticipated which equates to a 1.9 cfs increase. However, no adverse affects are anticipated due to this increase as the 100-yr peak flows are stable, and therefore the 5-yr flows are stable and non-erosive as well.

c. Operations & Maintenance

An Operations and Maintenance Manual will not be required as there are no permanent stormwater facilities being constructed with this project. Improvements will be maintained by the property owner, unless assigned through proper legal channels to another accepting party.

d. Grading & Erosion Control Plan

A separate Grading and Erosion Control plan has been submitted concurrently with this report to support the proposed site improvements (common access drive and culvert).

e. Four Step Method

Step 1 – Reducing Runoff Volumes: The site is currently farm land/range land and is highly vegetated with native grasses and shrubs. The natural vegetation on-site will be preserved to the extent practical with this project and historic drainage patterns will be preserved. Overall lot imperviousness will be limited to less than 10%. The site drains towards Hay Creek from the north and south, and the floodplain will be plated with a "no build" easement, along with additional "no build" areas south of the creek. This facilitates a permanent vegetated buffer between the proposed improvements and Hay Creek which will slow runoff, promote infiltration and increase water quality treatment for the developed runoff.

Step 2 – Treat and slowly release the WQCV: The site is comprised of 5+ acre lots with imperviousness less than 10% and meets the requirements for "Large Lot Single-Family Residential". These lots are excluded from

water quality treatment per Section I.7.1.B.5 of the ECM. Additionally, the site includes "no build" easements encompassing the floodplain and Hay Creek. This will preserve the existing grass buffers and native vegetation between developed areas and the site outfall. This grass buffer will provide in-line water quality treatment for developed flows prior to them leaving the site. No formal calculation has been included, as this is not a requirement.

Step 3 – Stabilize stream channels: All new and re-development projects are required to construct or participate in the funding of channel stabilization measures. Drainage basin fees paid, at the time of platting, go towards channel stabilization with the drainage basin. This site does not increase peak flows to the creek or downstream properties, therefore; no negative effects of downstream or adjacent properties are anticipated as a result of this project.

Step 4 – Consider the need for source controls: No industrial or commercial uses are proposed within this development and therefore no source controls are proposed.

f. Drainage Basin & Bridge Fees

Drainage and bridge fees for the Beaver Creek Drainage Basin are due at time of platting. See table below for anticipated drainage and bridge fees for HAY CREEK HULL SUBDIVISION. Per the El Paso County Engineering Criteria Manual, Appendix I, Section 3.10.1a fee reductions for low density lots are applicable at a rate of 25%. Please see the calculation for imperviousness area

	Beaver Cre	eek Drainag	e Basin Fee	S
Total Acreage	Site % Impervious	Impervious Acreage	Basin Fee/ Imp. Ac.	Basin Fee w/ 25% reduction
28.40	8.4	2.38	\$14,846	\$26,500.11

g. Engineer's Opinion of Probable Cost

An engineer's opinion of probable cost has been included in Appendix E.

V. Summary

HAY CREEK HULL SUBDIVISION remains consistent with pre-development drainage conditions with the construction of the recommended drainage improvements. The proposed development will not adversely affect downstream or adjacent properties, stormwater infrastructure, or surrounding developments. This report meets the latest El Paso County Drainage criteria.

Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

¹ Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS).

Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values. Please refer to NOAA Atlas 14 document for more information.

NOTES:

 $t_c = t_i + t_t$

Where:

 t_c = computed time of concentration (minutes)

t_i = overland (initial) flow time (minutes)

 t_t = channelized flow time (minutes).

 $t_t = \frac{L_t}{60K\sqrt{S_o}} = \frac{L_t}{60V_t}$

Where:

 t_t = channelized flow time (travel time, min) L_t = waterway length (ft) S_0 = waterway slope (ft/ft) V_t = travel time velocity (ft/sec) = K $\sqrt{S_0}$ K = NRCS conveyance factor (see Table 6-2). $t_i = \frac{0.395(1.1 - C_5)\sqrt{L_i}}{S_a^{0.33}}$

Where:

Eq

 t_i = overland (initial) flow time (minutes) C_5 = runoff coefficient for 5-year frequency (from Table 6-4) L_i = length of overland flow (ft) S_o = average slope along the overland flow path (ft/ft).

Equation 6-4?6-17*i*) + $\frac{L_t}{60(14i+9)\sqrt{S_t}}$

50

 t_c = minimum time of concentration for first design point when less than t_c from Equation 6-1. L_t = length of channelized flow path (ft) t = imperviousness (expressed as a decimal) S_t = slope of the channelized flow path (ft/ft).

Use a minimum t_c value of 5 minutes for urbanized areas and a minimum t_c value of 10 minutes for areas that are not considered urban. Use minimum values even when calculations result in a lesser time of concentration.

Table 6-2. NRCS Conveyance factors, K

Type of Land Surface	Conveyance Factor, K
Heavy meadow	2.5
Tillage/field	5
Short pasture and lawns	7
Nearly bare ground	10
Grassed waterway	15
Paved areas and shallow paved swales	20

Off-site impervious areas not included (Hay Creek Road ROW improvements)

Total on-site imperviouness

0.084 * 28.40 ac = 2.38 impervious acres Drainage Fee = 14,846/imp. acre Total Fee Calculated = 2.38 * \$14,846 = \$35,416.62 25% reduction (low density lots) = .75* \$35,416.62 = \$26,562.46

FINAL DRAINAGE REPORT

for

Hay Creek Ranch

Prepared for: El Paso County Department of Public Works Engineering Division

On Behalf of:

Hay Creek, LLC

Prepared by:

2925 Professional Place, Suite 202 Colorado Springs, Colorado 80904 (719) 575-0100 fax (719) 575-0208

March 28, 2003

R:\01.054.001\Drainage\03-2003DR.doc

Engineer's Statement:

•

•

۲

The attached drainage plan and report were prepared under my direction and supervision and are correct to the best of my knowledge and belief. Said drainage report has been prepared according to the criteria established by the County for drainage reports and said report is in conformity with the master plan of the drainage basin. I accept responsibility for any liability caused by any negligent acts, errors or omissions on my part in preparing this report.

SEAL

Jay S. Peters Registered Professional Engineer State of Colorado No. 35068

Developer's Statement:

I, the developer have read and will comply with all of the requirements specified in this drainage report and plan.

Hay Creek, LLC. **Business Name** By: Title: Mc Address: 3045 Creekk prince 8092

El Paso County:

Filed in accordance with Section 51.1 of the El Paso Land Development Code, as amended.

County Engineer/Director Date Conditions:

3.0 Drainage Design Criteria

3.1 Development Criteria

Matrix Design Group (Matrix) planned the stormwater system based on the criteria presented in the City of Colorado Springs and El Paso County Drainage Criteria Manual, 1987, revised in 1994. The system is planned to not adversely impact off site flows, or aggravate existing stormwater related off site problems.

3.2 Hydrologic Criteria

Matrix conducted the hydrologic analyses based on the information presented in the City of Colorado Springs and El Paso County Drainage Criteria Manual, 1987, revised 1994.

Major Basin Hydrology

Flows for the Hay Creek Basin were analyzed using the National Resource Conservation Service (NRCS, Previously the Soil Conservation Service, or SCS) hydrograph method. We used the TR-20 computer model developed by the NRCS, which applies the unit hydrograph method presented in the DCM.

We evaluated the 10- and 100-year 24-hour storm events. The 24-hour rainfall depths are 3.0 and 4.4 inches for the 10- and 100-year storm events, respectively. We used the NRCS 24-hour Type IIa rainfall distribution (see Figure 5) to simulate storm events. Hydrologic information used in the analysis is summarized in Table 1. Detailed calculations are presented in Appendix A, as well as the TR-20 input and output.

The Hay Creek Watershed area was planimetered from the USGS quadrangle map. Land cover was obtained from aerial photos of the watershed. Soils information was obtained from the El Paso County Soil Survey and the 1992 Monument Creek Drainage Basin Study. The Curve Numbers (CN) used in the hydrologic analysis match the projected values presented in the Monument Creek Study (see Tables A.1 and A.2, and Figure A.2 in Appendix A).

We estimated the time of concentration using the standard NRCS method. The Hay Creek channel has a slope of about 4% for most of its length, and 33% for about 4,700 feet. See Figure A.2 and Table A.3 in Appendix A illustrating the time of concentration calculations. Matrix used the normal depth method to estimate the average channel velocity used in the NRCS peak flow estimates. The channel slopes used in the calculations were derived from contours on the USGS maps. The velocities used in the NRCS calculations are reasonable.

		Table 1	······································		
	NRCS H	drograph Metho	d Parameters		_
10-year 24-Hr	100-Year 24-Hr	Rainfall	Watershed	Time of	CN
