

Final Drainage Report
for
Stonebridge Filing 4
at
Meridian Ranch

EL PASO COUNTY, COLORADO

September 2018

Prepared For:

GTL DEVELOPMENT, INC.
P.O. Box 80036
San Diego, CA 92138

Prepared By:
Tech Contractors
11886 Stapleton Drive
Falcon, CO 80831
719.495.7444

PCD Project No. SF-18-023

CERTIFICATIONS

Design Engineer's Statement:

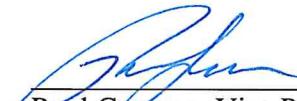

The attached drainage plan and report were prepared under my direction and supervision and are correct to the best of my knowledge and belief. Said drainage report has been prepared according to the criteria established by the County for drainage reports and said report is in conformity with the applicable master plan of the drainage basin. I accept responsibility for any liability caused by any negligent acts, errors or omissions on my part in preparing this report.

Thomas A. Kerby, P.E. #31429

Owner/Developer's Statement:

I, the owner/developer have read and will comply with all of the requirements specified in this drainage report and plan.

Raul Guzman, Vice President
GTL Development, Inc.
P.O. Box 80036
San Diego, CA 92138

12/5/18
Date

El Paso County:

Filed in accordance with the requirements of the Drainage Criteria Manual, Volumes 1 & 2, El Paso County Engineering Criteria Manual and Land Development Code as amended.

Jennifer Irvine, P.E.
County Engineer / ECM Administrator

Date

Stonebridge Filing 4 at Meridian Ranch

EXECUTIVE SUMMARY

The purpose of the following Final Drainage (FDR) is to present the changes to the drainage patterns as a result Stonebridge Filing 4 at Meridian Ranch (Stonebridge Filing 4) development. Runoff quantities and proposed facilities have been calculated using the current City of Colorado Springs/El Paso County Drainage Criteria Manual (DCM) (1994 version) and portions of the City of Colorado Springs Drainage Criteria Manual, Volume 1 (DCM-1) ((2014 version).

This report includes the recent revisions to the Meridian Ranch Sketch Plan amendment as adopted by the El Paso County Board of Commissioners. The Sketch Plan includes an increase of density to the overall development, but a general reduction in density in the area of this development resulting in lower developed runoff. Another significant change from previous drainage reports submitted to El Paso County concerning development associated within Meridian Ranch is the adopted changes to the drainage criteria. El Paso County by Resolution 15-042 adopted Chapter 6 of the 2014 version of the City of Colorado Springs Drainage Criteria Manual (COSDCM). Chapter 6 addresses the hydrologic calculations and includes an updated hydrograph to be used with storm drainage runoff. The new hydrograph results in lower historic values for runoff rates and higher developed values given the same input values. The county adopted Section 3.2.1 of Chapter 13 of the COSDCM referencing Full Spectrum Detention; the concept “provides better control of the full range of runoff rates that pass through detention facilities than the convention multi-stage concept. By providing an Excess Urban Runoff Volume (EURV) in the lower portion of the facility storage with an outlet similar to the Water Quality Capture Volume (WQCV), *frequent and infrequent inflows are released at rates approximating undeveloped conditions.*” This report includes hydrologic models from HEC-HMS for the historic, interim and future conditions for the 2-yr, 5-yr, 10-yr, 25-yr, 50-yr, and 100-yr design storm frequencies. The interim and the future conditions include detention facilities sized and modeled such that *“frequent and infrequent inflows are released at rates approximating undeveloped conditions”*

On November 16, 2000 the El Paso County Board of County Commissioners approved the rezoning of the Meridian Ranch project (PUD-00-010) from A-35 to PUD with several conditions. Condition number seven stated in part that “drainage plans shall release and/or retain at approximately eight percent (80%) of historic rates.” At the time of the initial approvals there were no drainage improvements downstream of the Meridian Ranch project and the existing natural channels were shallow and undefined. Since the time of the original approvals, development has occurred downstream of Meridian Ranch with drainage facilities designed and constructed of sufficient size to safely convey the historic flow rates discharged from Meridian Ranch to downstream properties. The facilities installed downstream of Meridian Ranch were analyzed for capacity and conveyance sufficiency with the most recently approved Meridian Ranch Sketch Plan Amendment (SKP-17-001) and MDDP, (approved March 14, 2018) see the report for more information regarding the sufficiency of the downstream facilities.

Stonebridge Filing 4 encompasses $68\pm$ acres and is located in Sections 29 and 30, Township 12 South, Range 64 West of the 6th Principal Meridian. It is approximately 12 miles northeast of the city of Colorado Springs, 2.5 miles north of the unincorporated town of Falcon, and immediately north of the Woodmen Hills development.

Stonebridge Filing 4 is located within three separate drainage basins; the Bennett Ranch Basin, Gieck Ranch Basin and the Haegler Ranch Basin. The Bennett and the Haegler Basins have been studied Basin and have final approval from El Paso County. The Gieck Ranch Basin has been studied, but has not received final approval from El Paso County. The developer has agreed to meet the requirements of the studied Gieck Ranch Basin but as yet to be approved Drainage Basin Study.

Based on the aforementioned design parameters the development of the project will not adversely affect downstream properties.

INTRODUCTION

Purpose

The purpose of the following Final Drainage Report (FDR) is to present proposed changes to the drainage patterns as a result of the development of Stonebridge Filing 4. The report outlines the proposed drainage mitigation based on calculated developed flows in excess of allowable exiting runoff discharge.

Scope

The scope of this report includes:

- Location and description of the proposed development stating the proposed land use, density, acreage and adjacent features to the site.
- Calculations for design peak flows from all off-site tributary drainage areas.
- Calculations for design peak flows within the proposed project area for all drainage areas.
- Discussion of major drainage facilities required as a result of the development.
- Discussion and analysis of existing and proposed facilities.

Runoff quantities and proposed facilities have been calculated using the current City of Colorado Springs/El Paso County Drainage Criteria Manual (DCM) (1994 version) and those portions of the City of Colorado Springs Drainage Criteria Manual, Volume 1 (DCM-1) ((2014 version) adopted by Resolution 15-042 of the El Paso County Board of County Commissioners.

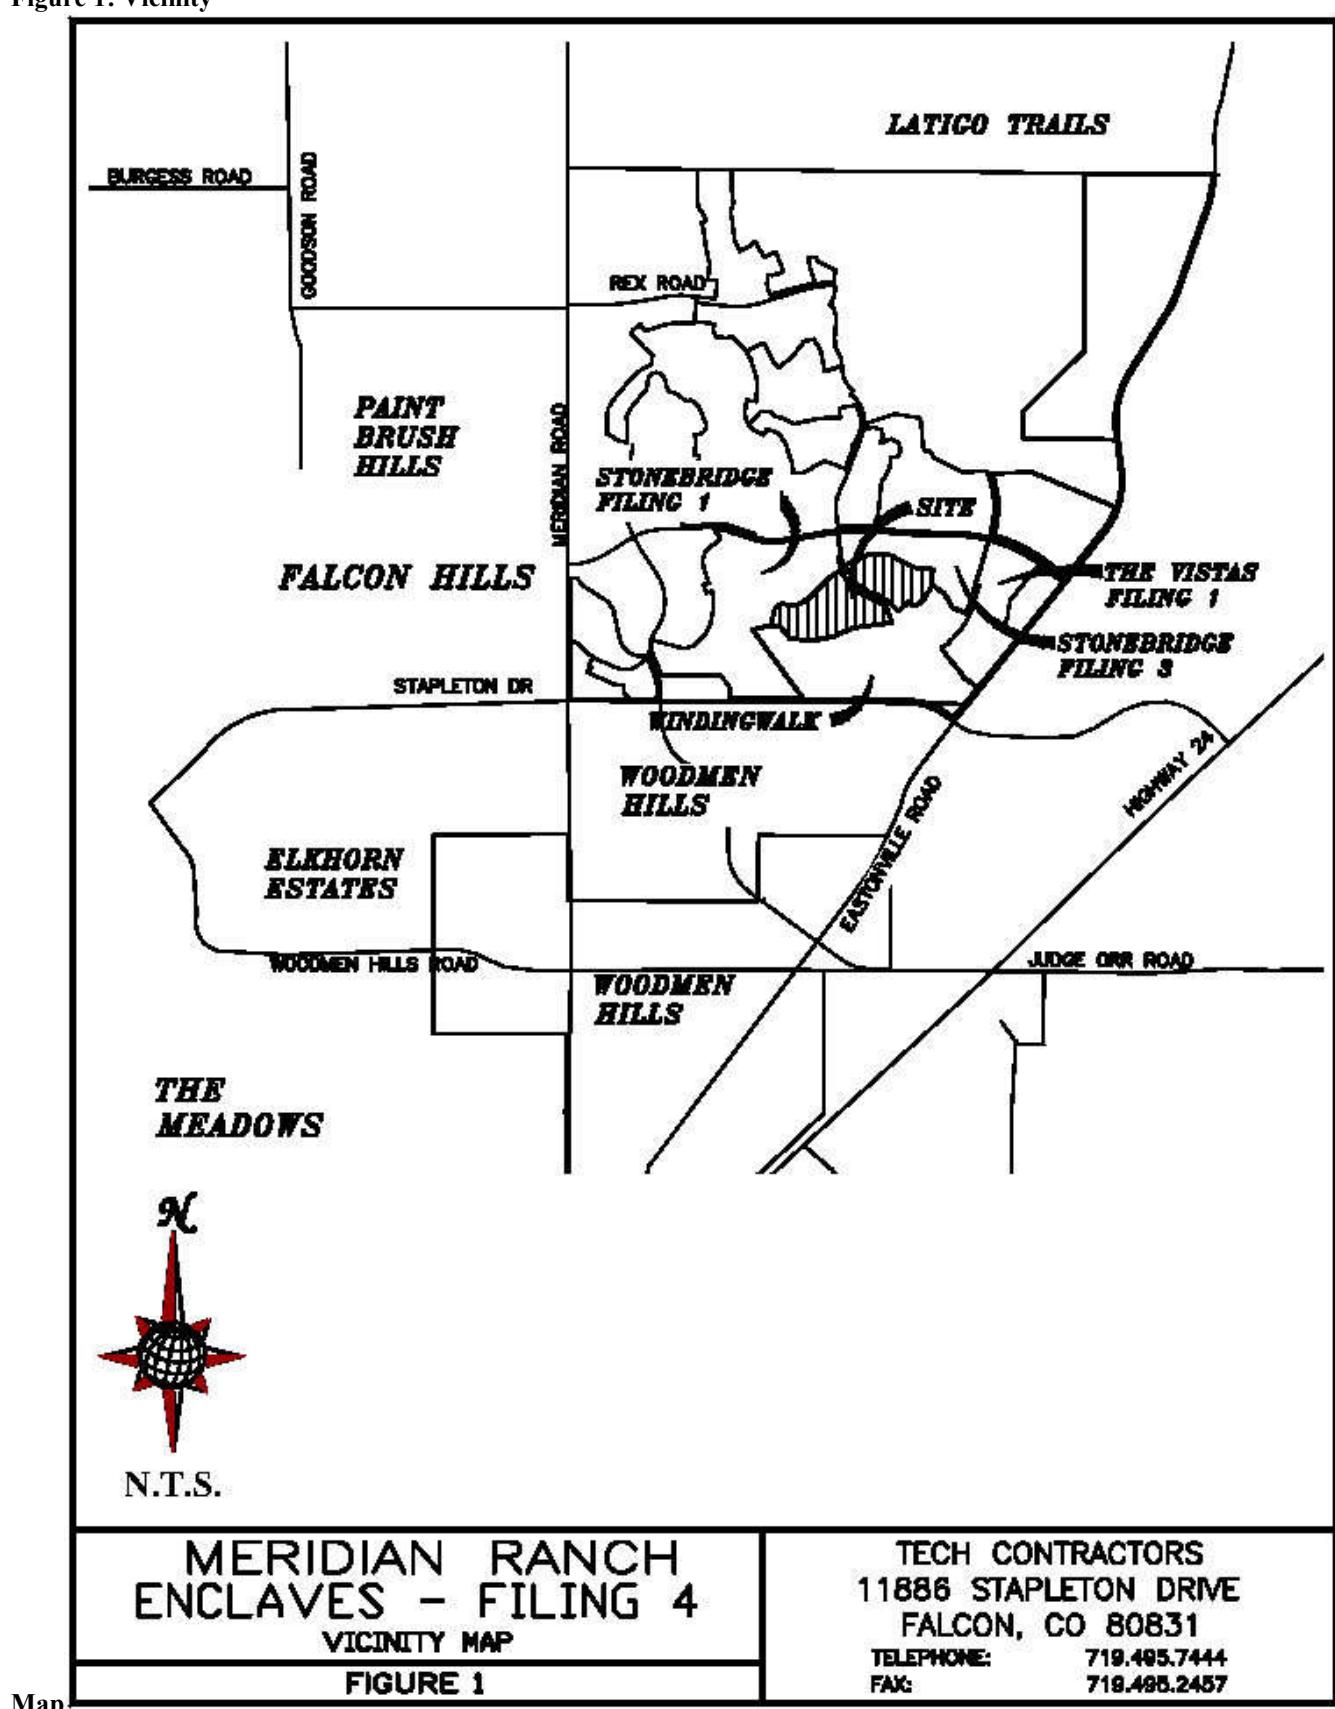

Background

On November 16, 2000 the El Paso County Board of County Commissioners approved the rezoning of the Meridian Ranch project (PUD-00-010) from A-35 to PUD with several conditions. Condition number seven stated in part that “drainage plans shall release and/or retain at approximately eight percent (80%) of historic rates.” At the time of the initial approvals there were no drainage improvements downstream of the Meridian Ranch project and the existing natural channels were shallow and undefined. The facilities installed downstream of Meridian Ranch were analyzed for capacity and conveyance sufficiency with the most recently approved Meridian Ranch Sketch Plan Amendment (SKP-17-001) and MDDP, (approved March 14, 2018) see the report for more information regarding the sufficiency of the downstream facilities. See the recently approved Meridian Ranch MDDP for the analysis of the downstream facilities

Development has occurred downstream of Meridian Ranch since the time of the original approvals with drainage facilities designed and constructed of sufficient size to safely convey the historic flow rates off of Meridian Ranch further downstream. The 4-Way Ranch development located adjacent and downstream of Meridian Ranch has processed a Letter of Map Revision (LOMR) and constructed storm drainage improvements downstream of the existing Pond E outlets. The LOMR was processed and the improvements constructed assuming historic flow rates from Meridian Ranch using the original El Paso County DCM.

Stonebridge Filing 4

Figure 1: Vicinity

Storm drain improvements near the intersection of Stapleton Drive and Eastonville have also been designed and constructed to convey the historic flow rates from Meridian Ranch. The design of these improvements and the downstream system anticipated 87 CFS to be collected near outlet of the future Pond H from Meridian Ranch. The design of Pond H has yielded a 100-year flow rate of 57 CFS, well below the anticipated 87 CFS figure.

Current estimates show the design discharge Pond E to 4-Way are near or below historic flow rates at full buildout for the 100-year discharge and the 5-year discharge.

EXISTING CONDITIONS

General Location

Stonebridge Filing 4 project encompasses 68+ acres and is located in Sections 29 and 30, Township 12 South, Range 64 West of the 6th Principal Meridian. It is approximately 12 miles northeast of the city of Colorado Springs, 2.5 miles north of the unincorporated town of Falcon, and immediately north of the Woodmen Hills development.

Land Use

Historically, ranching dominated the area surrounding Meridian Ranch; however, currently urbanization has occurred in the general vicinity. Most notably, urbanization is occurring to the north with Latigo Trails, to the south in the Woodmen Hills Subdivision, to the east in Four Way Ranch, to the west in the Falcon Hills subdivision, and to the northwest in the Paint Brush Hills subdivision.

Climate

Mild summers and winter, light precipitation; high evaporation and moderately high wind velocities characterize the climate of the study area. The average annual monthly temperature is 48.4 F with an average monthly low of 30.3 F in the winter and an average monthly high of 68.1 F in the summer. Two years in ten will have maximum temperature higher than 98 F and a minimum temperature lower than -16 F. Precipitation averages 15.73" annually, with 80% of this occurring during the months of April through September. The average annual Class A pan evaporation is 45 inches. (Soil Survey of El Paso County Area, Colorado).

Topography and Floodplains

The topography of the site is typical of a high desert, short prairie grass with relatively flat slopes generally ranging from 2% to 4%. The project site drains generally from the northwest to southeast and is tributary to the Black Squirrel Creek.

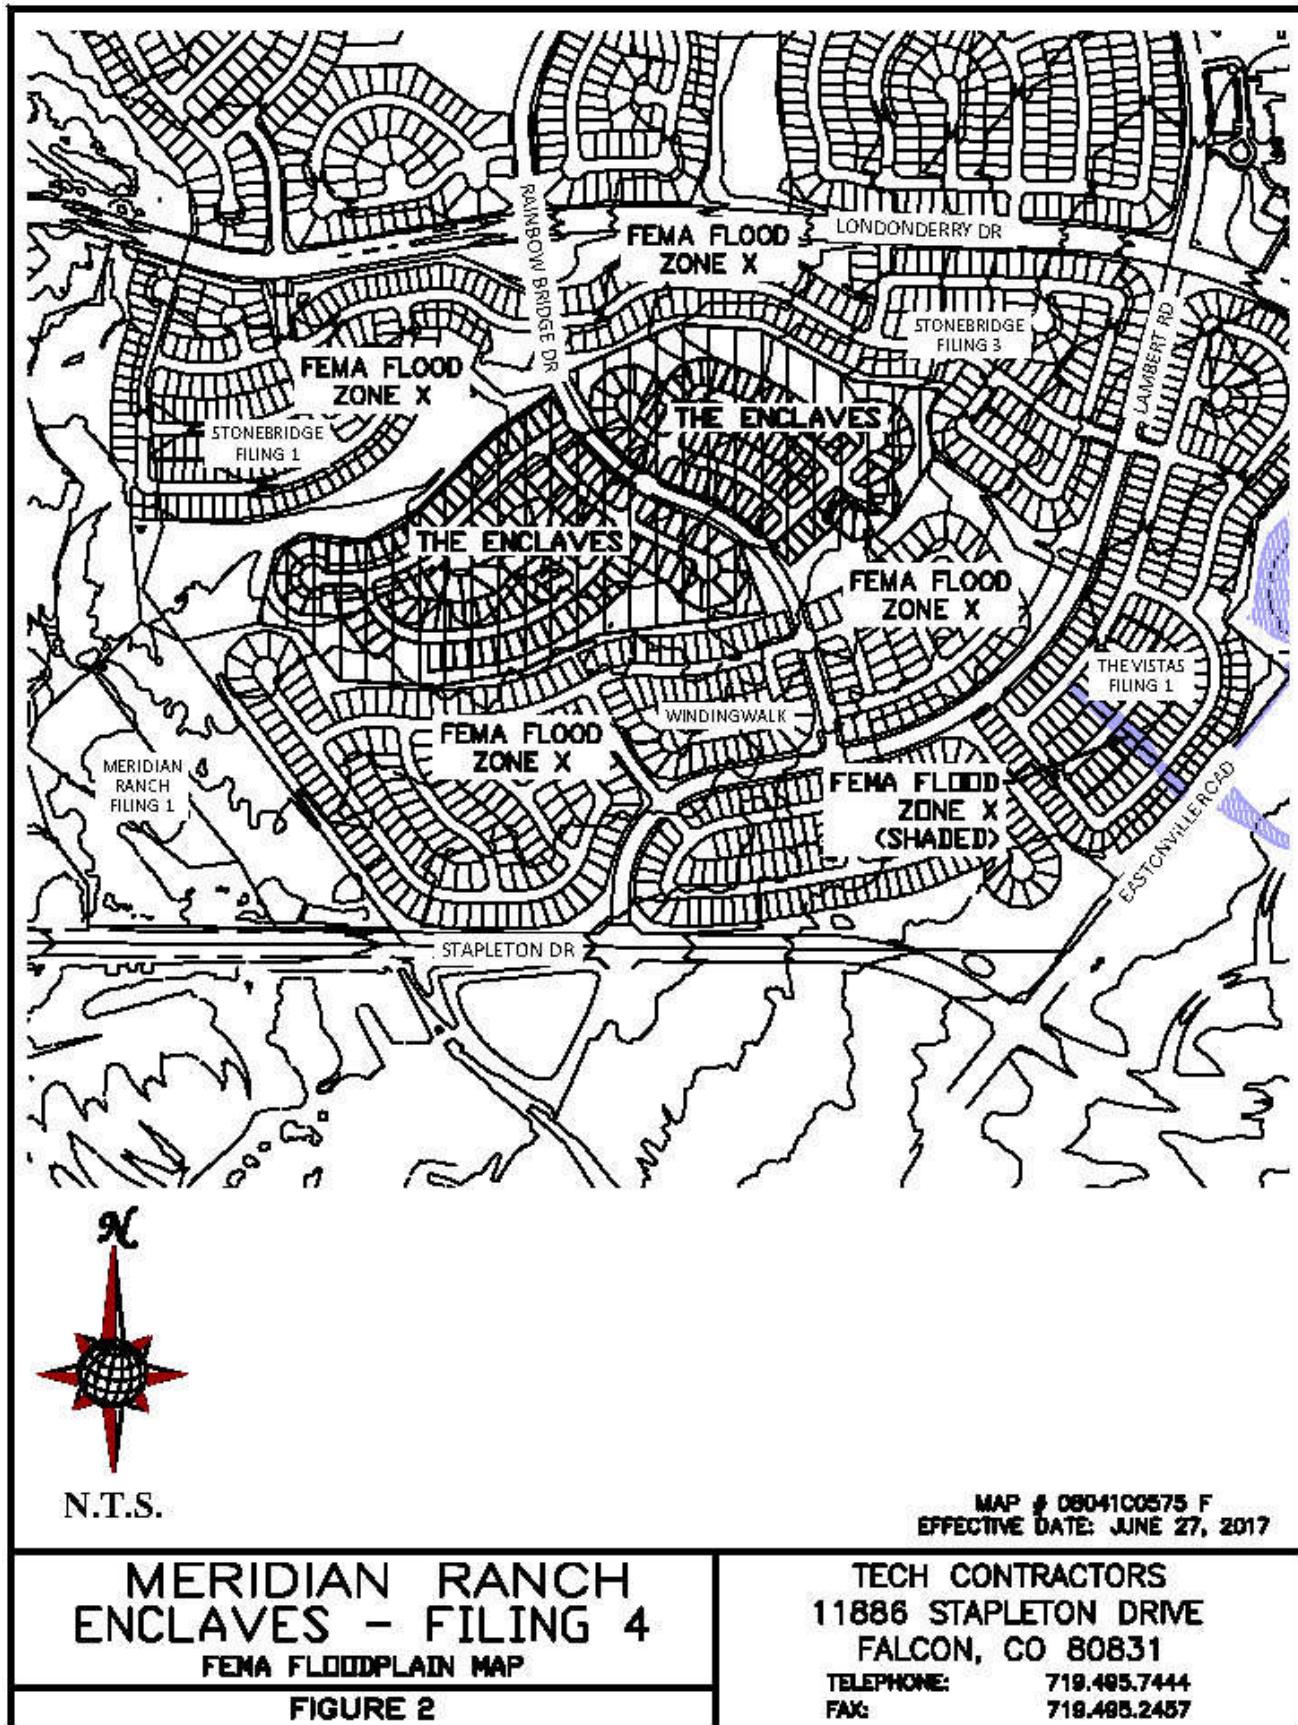

The Flood Insurance Rate Maps (FIRM No. 08041C0575-F dated 3/17/1997) indicates that the project is outside of any designated flood plain. Letter of Map Revision (LOMR), Case No. 14-08-1121P was approved by FEMA on November 6, 2014 with an effective date of March 24, 2015. Please see Figure 2: Stonebridge Filing 4 Federal Emergency Management Agency (FEMA) Floodplain Map.

Geology

The National Resources Conservation Service (NRCS) soil survey records indicate that the service area is predominately covered by soils classified in the Stapleton series. This series is categorized in the Hydrological Group B.

The Stapleton (83) sandy loam is a deep, non-calcareous, well-drained soil formed in alluvium derived from arkosic bedrock on uplands. Permeability of this soil is rapid. Available water capacity is moderate, surface runoff is slow, and the hazard of erosion and soil blowing is moderate. This soil is suited to habitat for open land and rangeland wildlife. The main limitation of this soil for urban development is frost-action potential.

Typically, these soils are well-drained, gravelly sandy loams that form on alluvial terraces and fans and exhibit high permeability and low available water capacity with depth to bedrock greater than 6 feet.

Note: (#) indicates Soil Conservation Survey soil classification number. See Figure 3 Stonebridge Filing 4 – Soils Map.

Natural Hazards Analysis

Natural hazards analysis indicates that no unusual surface or subsurface hazards are located near the vicinity. However, because the soils are cohesionless, sloughing of steep banks during drilling and/or excavation could occur. By citing improvements in a manner that provides an opportunity to lay the banks of excavations back at a 1:1 slope during construction, the problems associated with sloughing soils can be minimized.

DRAINAGE BASINS AND SUB-BASINS

The site is within the Bennett Ranch, Gieck Ranch and the Haegler Ranch Basins and accepts flow from areas north of the project site within portions of Meridian Ranch.

Three different scenarios were analyzed for the drainage conditions for the project.

The first scenario analyzes the historic conditions for Meridian Ranch. This condition has all of the Meridian Ranch development in the pre-development state; where the entirety of Meridian Ranch is modeled in its predeveloped, undisturbed condition.

The second scenario, the interim conditions scenario is the current existing conditions with the addition of Stonebridge Filing 4 in the developed condition. The current existing conditions assumes all approved projects and the WindingWalk PUD are at full buildout. The development of Stonebridge Filing 4 is entirely dependent upon the completion of the drainage improvements to be constructed with WindingWalk Filing 1 at Meridian Ranch (SK-18-002). See associated final drainage report and improvement plans for more information. This condition was analyzed to ensure that historic conditions at the outlets of Pond E (Design Points H08 & H09) located along Eastonville Road were maintained after the development of Stonebridge Filing 4 is completed. The development of the area south of Londonderry Drive will be finished with the completion of Stonebridge Filing 4, there will be areas north of Londonderry Drive that are tributary to Pond E that are yet to be developed.

The final scenario analyzes the future build out conditions for the entirety of Meridian Ranch to ensure the storm drain facilities located at the discharge points of the project are able to properly convey the historic peak flow rates as the storm drainage exits the project.

DRAINAGE DESIGN CRITERIA

SCS Hydrograph Procedure

The US Army Corp of Engineers HEC-HMS computer program was used to model the Soil Conservation Service (SCS) Hydrograph procedure was used to determine final design parameters for the major drainage facilities within the project. Onsite basin areas were calculated using aerial topography of the site and approved final design data. Times of concentration were estimated using the SCS procedures described in the DCM. Based upon the hydrologic soil type, the natural conditions found in the basins and the runoff curve numbers (CN) chart from Table 6-10 of the City of Colorado Springs DCM for Antecedent Runoff Condition II (ARC II), the following CN values were used for the given conditions.

Table 1: SCS Runoff Curve Numbers

| Condition | CN | | |
|-----------------------------|----|--------------------|----|
| Residential Lots (5 acre) | 63 | School | 80 |
| Residential Lots (2.5 acre) | 66 | Parks/Open Space | 62 |
| Residential Lots (1 acre) | 68 | Commercial | 85 |
| Residential Lots (1/2 acre) | 70 | Roadways | 98 |
| Residential Lots (1/3 acre) | 72 | Graded | 67 |
| Residential Lots (1/4 acre) | 75 | Golf Course | 62 |
| Residential Lots (1/5 acre) | 78 | Latigo Undeveloped | 65 |
| Residential Lots (1/6 acre) | 80 | Undeveloped | 61 |

*Curve Numbers were interpolated and based on amount of impervious area per lot. The 24 hour storm precipitation values were selected from the NOAA Atlas 14, Volume 8, Version 2 for the Meridian Ranch location (Latitude 38.9783°, Longitude -104.5842°, Elevation 7054 ft). These numbers along with SCS information were used as input to the U.S. Army Corp of Engineers HEC-HMS computer model to determine design runoffs. See the table for all the design storm events in Appendix A. These numbers along with SCS information were used as input to the U.S. Army Corp of Engineers HEC-HMS computer model to determine design runoffs.

Full Spectrum Design

The City of Colorado Springs adopted a new Drainage Criteria Manual (DCM) in 2014 which incorporated the use of *Full Spectrum Design* for storm drainage analysis for projects located within the city limits. Full Spectrum analyzes the storm water runoff for the 2-year, 5-year, 10-year, 25-year, 50-year and the 100-year design storms in order ensure the analysis more accurately project the conditions of post development. El Paso County adopted portions of the City's 2014 DCM by resolution in January 2015; the County resolution adopted Chapter 6 (Hydrology) and Section 3.2.1 of Chapter 13 (Full Spectrum Detention) for projects outside of the City of Colorado Springs establishing a 1 year review period to analyze the impacts of the Full Spectrum Design on the storm drainage analysis of projects. This report has incorporated the use of full spectrum in the analysis of the interim and future conditions.

The idea behind full spectrum detention is to release the developed runoff flows to at or below those of the pre-developed condition. The design of Pond H and the outlet control structure meets or exceeds the intent and spirit of the concept.

Table 2: Detention Pond Summary:

| BENNETT REGIONAL DETENTION POND | | | | | | |
|---------------------------------|----------------|-----------------|-----------------|------------------|-----------------|-------------------|

DRAINAGE CALCULATIONS

SCS General Overview

The project is located within portions of the Bennett Ranch, Gieck Ranch and the Haegler Ranch Basins. Storm water runoff will be conveyed across the site overland and within storm drain networks to the detention ponds and existing drainage swales. Temporary sedimentation ponds were constructed during the WindingWalk grading operations within the boundaries of this project and the WindingWalk project. The sedimentation ponds installed within the boundaries of WindingWalk Filings 1 & 2 were removed with the completion of those improvements. The temporary sedimentation ponds within Stonebridge Filing 4 are to be removed during the construction of that project.

The detention facilities have been adequately sized such that the developed flows will be detained and released at or below the historic flow rates for the various design storm events as outlined in the El Paso County DCM and those sections of the City of Colorado Springs DCM-1 adopted by the El Paso County Board of County Commissioners. Existing facilities located downstream of the proposed development have been designed and/or constructed to accept the given release flow rates from Meridian Ranch. Those existing facilities have been reviewed sufficiently to verify the capacity to convey the storm flow rates from Meridian Ranch. See approved Meridian Ranch MDDP, dated January 2018.

Portions of rear lots within the site are tributary to the Bennett Ranch Basin (SCS DB28) and drain into open space and then will be directed to an existing sedimentation pond prior to being released into the adjacent channel then conveyed downstream to the existing Bennett Ranch Regional Detention facility. The existing sedimentation pond located near the Stapleton Box culvert will be removed upon establishment of 70% of historic vegetative cover for areas tributary to this pond.

The portions of the project are tributary to the existing Bennett Regional Detention Pond located downstream in Woodmen Hills. The pond was designed using the old criteria hydrologic methods and with a release rate approximating 80% of the historic peak flow rates for the 5-year and the 100-year storm events. The analysis shows the pond releasing the developed peak flows below the historic flow rates for the full spectrum of design storms. The pond was also designed with water quality provisions to accommodate the entirety of all tributary areas from Meridian Ranch and Woodmen Hills.

Those portions of the site tributary to the Haegler Ranch Basin (SCS FH1) will be collected by existing and proposed storm drains located with the Stonebridge Filing 4 PUD and the existing WindingWalk development to the south and released to the existing Pond H detention basin. The Pond H is an extended detention pond until and will provide the necessary water quality for the portions located within the Haegler Basin.

The analysis shows the pond releasing the developed peak flows below the historic flow rates for the full spectrum of design storms. The existing storm drain pipe accepting flow from the proposed Pond H is designed to accept a higher flow rate than the Historic rate of flow and the rate of flow that will be discharge from the pond during the 100-yr storm event.

That portion of the site (SCS FG18) located within the Gieck Ranch Basin, tributary to existing Pond E was designed using the old criteria hydrologic methods and with a release rate approximating 80% of the historic peak flow rates for the 5-year and the 100-year storm events. The analysis shows the pond releasing the developed peak flows below the historic flow rates for the full spectrum of design storms using the newly adopted unit hydrograph from the City DCM-1.

Figure 5: Meridian Ranch SCS Calculations – Historic Conditions Map, Figure 6: Meridian Ranch SCS Calculations – Interim Conditions Map and Figure 7: Meridian Ranch SCS Calculations – Future Conditions Map depict the historic, interim and future general drainage patterns for Stonebridge Filing 4.

The purpose of this report is to show that the development of Stonebridge Filing 4 will not adversely impact the existing drainage facilities adjacent to and downstream of the developed area and the existing Ponds E & H are properly sized for the anticipated future development of Stonebridge Filing 4.

SCS Calculations

Historic Drainage - SCS Calculation Method

Following is a tabulation of the surface drainage characteristics under Existing Conditions using the SCS calculation method. Please refer to Figure 5 - Meridian Ranch SCS Calculations - Historic Basin Map.

See approved Meridian Ranch MDDP (EPC File SKP171) dated January 2018 for complete hydrologic calculations and maps.

Interim Drainage - SCS Calculation Method

Following is a tabulation of the surface drainage characteristics for the interim conditions using the SCS calculation method. Please refer to Figure 5 - Meridian Ranch SCS Calculations – Interim Basins Map

Table 4: Interim Drainage Basins-SCS

See approved Meridian Ranch MDDP (EPC File SKP171) dated January 2018 for complete hydrologic calculations and maps.

Future Drainage - SCS Calculation Method

Following is a tabulation of the surface drainage characteristics for the future conditions using the SCS calculation method. Please refer to Figure 6 - Meridian Ranch SCS Calculations – Future Basins Map

Table 5: Future Drainage Basins-SCS

| FUTURE CONDITIONS | | | | | | | |
|--------------------|-------------------------|---------------------------|--------------------------|--------------------------|--------------------------|-------------------------|-------------------------|
| HYDROLOGIC ELEMENT | DRAINAGE AREA (SQ. MI.) | DISCHARGE PEAK Q100 (CFS) | DISCHARGE PEAK Q50 (CFS) | DISCHARGE PEAK Q25 (CFS) | DISCHARGE PEAK Q10 (CFS) | DISCHARGE PEAK Q5 (CFS) | DISCHARGE PEAK Q2 (CFS) |

See approved Meridian Ranch MDDP (EPC File SKP171) dated January 2018 for complete hydrologic calculations and maps.

Rational Calculations

The Rational Hydrologic Calculation Method was used to estimate the total runoff from the 5-year and the 100-year design storm and thus establish the storm drainage system design. Using the rational calculation methodology outlined in the Hydrology Section (Ch 6) of the COSDCM coupled with the El Paso County EPCDCM an effective storm drainage design for Stonebridge Filing 4 has been designed. The storm drainage facilities have been designed such that the minor storm will be captured by the inlets and conveyed by the storm drain pipes such that the street flow does not overtop the curbs. The storm drainage facility has been designed such that the major storm will be captured by the inlets and conveyed by the storm drain pipes such that the street flow does not exceed the right-of-way widths for residential streets and the hydraulic grade line will be less than one foot below the surface.

The far eastern portion of the site is located within the Gieck Ranch Drainage Basin, the middle section (along Rainbow Bridge Dr) is located within Haegler Ranch Drainage Basin and the western rear lots (adjacent to open space) are within the Bennett Ranch Drainage Basin. The project will discharge the collected surface flow from the project into existing downstream facilities properly sized to safely convey the storm water flows away from the project without damaging adjacent property.

Rational hydrologic calculations were performed for the entire PUD area and hydraulic calculations will be provided in the final drainage report at final plat. That portion located within the Gieck Basin will be collected by a series of inlets and storm drain pipe then conveyed through an existing storm drain system constructed as a part of the Vistas Filing 1 and discharged into the existing Pond E.

The Haegler Ranch portion will consist of a single backbone storm drain system located along Rainbow Bridge Dr that was installed during the construction on WindingWalk Filing 1. The system ranges in size from 24" to 48" that collects runoff from laterals and inlets, conveying the collected flow southerly through WindingWalk Filing 1 and discharging the storm water into Pond H located near northwest of the intersection of Stapleton Drive and Eastonville Road. The storm water (57 CFS) will be released into an existing storm drainage system at rates below the historic flow rates and significantly below the anticipated design flow (87 CFS) when the system was designed and constructed.

The Bennett Ranch portion consists of the rear yards of walkout and garden level lots that runoff toward open space. The runoff will either enter an existing drainage swale or into an existing storm drain system, conveyed to an existing temporary sedimentation pond where it will be discharged into the main Bennett Ranch Channel then be conveyed to the Bennett Ranch Regional Detention Pond. The Bennett Ranch Regional Detention Pond was designed and constructed to provide water quality and detain developed runoff from the Bennett Ranch portions of both the Meridian Ranch and Woodmen Hills subdivisions such that the storm flow rates at Judge Orr Road and the Bennett Channel are at or near 80% of historic flow rates.

Rational Narrative

The following is a detailed narrative of the storm drainage system located within Stonebridge Filing 4. The description is organized by system beginning on the west in the Bennett Ranch portion of Stonebridge Filing 4 and ending on the east side of the project in the Gieck Ranch Basin.

Bennett Ranch

- Basin B18 (6.1 acres, $Q_5 = 6.2 \text{ CFS}$, $Q_{100} = 16 \text{ CFS}$) contains the rear lots of Stonebridge Filing 4 at the western end of Enclave Scenic Way and the open space behind the lots. The surface runoff will sheet flow off of the residential lots and be directed to a swale in the open space then to an existing Type C inlet. All of the flow is captured by this inlet ($Q_5 = 6.2 \text{ CFS}$, $Q_{100} = 16 \text{ CFS}$) and is conveyed downstream via an existing 24" RCP constructed with WindingWalk Filing 1 to an existing swale combining with additional storm runoff collected with the WindingWalk Filing 1 subdivision.
- Basin B22 (11.6 acres, $Q_5 = 13 \text{ CFS}$, $Q_{100} = 32 \text{ CFS}$) contains the rear lots along Enclave Scenic Way and from Stonebridge Filing 1, the Lodge Recreation Center and the open space behind the lots. The surface runoff will sheet flow off of the residential lots and be directed to a swale in the open space and conveyed downstream continuing through the open space.

- Basin B23 (9.8 acres, $Q_5 = 10$ CFS, $Q_{100} = 26$ CFS) contains the rear lots along Enclave Scenic Way and from Stonebridge Filing 1, and the open space behind the lots. The surface runoff will sheet flow off of the residential lots, combined with the flow from Basin B22 for a total flow of $Q_5 = 18$ CFS, $Q_{100} = 46$ CFS then be conveyed downstream via the existing swale continuing through the open space.
- Basin B24 (9.1 acres, $Q_5 = 8.1$ CFS, $Q_{100} = 21$ CFS) contains the rear lots from WindingWalk Filing 1 from Stonebridge Filing 1, and the open space behind the lots. The surface runoff will sheet flow off of the residential lots, combined with the flow from Basin B22 and B23 for a total flow of $Q_5 = 19$ CFS, $Q_{100} = 49$ CFS and then be combined with flow from an existing storm drain constructed as a part of WindingWalk Filing 1.
- The total combined flow within the storm drain pipe ($Q_5 = 14$ CFS, $Q_{100} = 41$ CFS) is discharged into an existing temporary sedimentation pond, combined with surface flow from Stonebridge Filing 1 and a portion of Stonebridge Filing 4 ($Q_5 = 19$ CFS, $Q_{100} = 49$ CFS). The total flow ($Q_5 = 30$ CFS, $Q_{100} = 72$ CFS) is then discharged in the main Bennett Ranch Channel and conveyed southerly toward the Bennett Ranch Regional Detention Pond.
- Basin B01 (1.9 acres, $Q_5 = 2.6$ CFS, $Q_{100} = 6.0$ CFS) contains lots along the north side of Enclave Scenic Way, the surface runoff will sheet flow off of the residential lots and be conveyed to a 5' Type R sump Inlet located at I01. All of the flow is captured by this inlet ($Q_5 = 2.6$ CFS, $Q_{100} = 6.0$ CFS) is conveyed via an 18" RCP to Junction J01 where it will combine with the runoff captured at I02.
- Basin B02 (1.9 acres, $Q_5 = 2.7$ CFS, $Q_{100} = 6.3$ CFS) contains lots along the south side of Enclave Scenic Way, the surface runoff will sheet flow off of the residential lots and be conveyed to a 10' Type R flow-by inlet located at I02. The flow captured by this inlet ($Q_5 = 2.1$ CFS, $Q_{100} = 4.2$ CFS) is conveyed via an 18" RCP to Junction J01. The remaining surface runoff ($Q_5 = 0.6$ CFS, $Q_{100} = 2.1$ CFS) continues along the curb and gutter toward I04.
- The pipe flow from Junction J01 ($Q_5 = 3.7$ CFS, $Q_{100} = 10$ CFS) is conveyed via a storm drain system through several manholes to Junction J05.
- Basin B03 (4.4 acres, $Q_5 = 7.2$ CFS, $Q_{100} = 16$ CFS) contains lots along the west side of Marble Canyon Way and east side of Granite Park Lane., the surface runoff will sheet flow off of the residential lots and be conveyed to a 15' Type R forced sump Inlet located at I03. Most of the flow is captured by this inlet ($Q_5 = 7.2$ CFS, $Q_{100} = 15$ CFS) is conveyed via a storm drain to Junction J05 where it will combine with the pipe flow from Junction J01. The remaining surface runoff ($Q_{100} = 1.5$ CFS) continues along the curb and gutter toward I04.

- Basin B04 (7.4 acres, $Q_5 = 9.3$ CFS, $Q_{100} = 23$ CFS) contains lots along the north side of Granite Ridge Dr. The surface runoff will sheet flow off of the residential lots and be captured by a 15' Type R sump inlet located at I04. The flow captured by this inlet ($Q_5 = 9.3$ CFS, $Q_{100} = 23$ CFS) is conveyed via an 18" RCP to Junction J05.
- The pipe flow conveyed to Junction J05 from J01 and I03 is combined with flow captured by I04 for a total flow of $Q_5 = 14$ CFS, $Q_{100} = 42$ CFS.
- Basin B05 (2.5 acres, $Q_5 = 3.3$ CFS, $Q_{100} = 7.6$ CFS) contains lots along the south side of Granite Ridge Dr, the surface runoff will sheet flow off of the residential lots and be conveyed to a 10' Type R sump inlet located at I05. All of the flow is captured by this inlet ($Q_5 = 3.3$ CFS, $Q_{100} = 7.6$ CFS) and is combined with flow from Junction J05 ($Q_5 = 14$ CFS, $Q_{100} = 42$ CFS) for a total flow of $Q_5 = 16$ CFS, $Q_{100} = 49$ CFS and is conveyed southerly through a future open space with Stonebridge Filing 4 and an existing Type C inlet (CB01). Should both sump inlets (I04 & I05) at this location become clogged, the side yard is able to safely convey the total Q_{100} flow of 29 CFS through the rear yard to the open space and collect the surface flow at CB01.
- Basin B06 (5.8 acres, $Q_5 = 6.6$ CFS, $Q_{100} = 17$ CFS) contains the rear lots along Granite Ridge Dr. and an open space of Stonebridge Filing 4. The surface runoff will sheet flow off of the residential lots and be directed to a swale in the open space then to a Type C inlet (CB01). All of the flow is captured by this inlet ($Q_5 = 6.6$ CFS, $Q_{100} = 17$ CFS) is combined with the upstream flow and is conveyed via an existing 36" RCP ($Q_5 = 20$ CFS, $Q_{100} = 62$ CFS) to inlet I06. The total flow is then conveyed through WindingWalk Filing 1 via an existing storm drain system. See the approved WindingWalk Filing 1 Final Drainage Report for more information.

Haegler Ranch

- Basin H01 (1.0 acres, $Q_5 = 1.5$ CFS, $Q_{100} = 3.5$ CFS) contains lots fronting along the Granite Ridge Dr and Meridian Mills Tr, the surface runoff will sheet flow off of the residential lots and be conveyed via curb and gutter to DP05.
- Basin H02 (3.5 acres, $Q_5 = 6.1$ CFS, $Q_{100} = 13$ CFS) contains lots along the Meridian Mills Tr and the east side of Rainbow Bridge Dr, the surface runoff will sheet flow off of the residential lots and is combined with the surface flow from DP05 then is conveyed to an existing 20' Type R forced sump inlet located at I20. Most of the flow is captured by this inlet ($Q_5 = 7.4$ CFS, $Q_{100} = 15$ CFS) is conveyed via an existing 18" RCP to J22, J23, and J24 where it will combine with the pipe flow from I23. The remaining surface runoff ($Q_{100} = 1.3$ CFS) continues along the curb and gutter southerly along Rainbow Bridge toward I23.
- Basin H03 (3.0 acres, $Q_5 = 5.8$ CFS, $Q_{100} = 12$ CFS) contains lots from Stonebridge Filing 1 on Stone Valley Dr and the west side of Rainbow Bridge Dr, the surface runoff will sheet flow off of the residential lots and be conveyed via curb and gutter to DP06.

- Basin H04 (2.4 acres, $Q_5 = 4.8$ CFS, $Q_{100} = 10$ CFS) contains lots along the east side of Marble Canyon Way and the west side of Rainbow Bridge Dr, the surface runoff will sheet flow off of the residential lots and is combined with the surface flow from DP06 then is conveyed to an existing 20' Type R forced sump inlet located at I21. The flow captured by this inlet ($Q_5 = 9.0$ CFS, $Q_{100} = 19$ CFS) is conveyed via a proposed 24" RCP to J25A and I22.
- Basin H05 (2.0 acres, $Q_5 = 3.5$ CFS, $Q_{100} = 7.9$ CFS) contains lots along Marble Canyon Way. The surface runoff will sheet flow off of the residential lots and be conveyed to a proposed 10' Type R sump inlet located at I22. All of the flow is captured by this inlet and is combined with the upstream flow from I21 ($Q_5 = 9$ CFS, $Q_{100} = 25$ CFS) and conveyed via an existing 24" RCP downstream to manholes J25B and J26 located in Rainbow Bridge. Should the sump inlet at this location become clogged, the side yard is able to safely convey the total Q_{100} flow of 7.9 CFS through the rear yard to the open space and collect the surface flow at CB03.
- During the interim condition, prior to the construction of Stonebridge Filing 4, the surface runoff from Basins H03 and H04 was directed to a temporary sedimentation pond constructed during the grading operations associated with the WindingWalk Grading Permit. A temporary temporary CMP riser was connected to the storm drain system constructed with WindingWalk Filing 1. The temporary pond will be removed during the construction of the improvements for Stonebridge Filing 4 and the CMP riser will be replaced with the proposed 10' Type R sump inlet at I22.
- Basin H06 (2.5 acres, $Q_5 = 4.3$ CFS, $Q_{100} = 9.9$ CFS) contains lots along the east side of Meridian Mills Tr, the surface runoff will sheet flow off of the residential lots and be conveyed via curb and gutter to DP07.
- Basin H07 (3.1 acres, $Q_5 = 6.3$ CFS, $Q_{100} = 14$ CFS) contains lots along the west side of Meridian Mills Tr and the east side of Rainbow Bridge Dr, the surface runoff will sheet flow off of the residential lots and is combined with the surface flow from DP07 then is conveyed to an existing 15' Type R forced sump inlet located at I23. Most of the flow is captured by this inlet ($Q_5 = 8.4$ CFS, $Q_{100} = 15$ CFS) is conveyed via an existing 24" RCP to J24 where it will combine with the pipe flow from I20 ($Q_5 = 12$ CFS, $Q_{100} = 29$ CFS) and conveyed via an existing 24" RCP downstream to manholes J26. The remaining surface runoff ($Q_{100} = 5.0$ CFS) continues along the curb and gutter southerly along Rainbow Bridge toward I25.
- The pipe flow conveyed to Junction J26 from J25B and J24 is combined at J26 for a total flow of $Q_5 = 20$ CFS, $Q_{100} = 51$ CFS conveyed via a 30" RCP downstream to manhole J27.
- Basin H08 (4.4 acres, $Q_5 = 4.6$ CFS, $Q_{100} = 12$ CFS) contains the rear lots and an open space of Stonebridge Filing 4. The surface runoff will sheet flow off of the residential lots and be directed to a swale in the open space then to an existing Type C inlet

(CB03). All of the flow is captured by this inlet ($Q_5 = 4.6$ CFS, $Q_{100} = 12$ CFS) and is conveyed via an existing 18" to J27.

- Basin H09 (2.8 acres, $Q_5 = 3.1$ CFS, $Q_{100} = 8.0$ CFS) contains the rear lots of Stonebridge Filing 4 and a park within WindingWalk Filing 1. The surface runoff will sheet flow off of the residential lots and be directed to a swale in the park then to an existing Type C inlet (CB04). All of the flow is captured by this inlet ($Q_5 = 3.1$ CFS, $Q_{100} = 8.0$ CFS) and is conveyed via an existing 18" to J27.
- The pipe flow conveyed to Junction J27 from J26, CB03 and CB04 is combined at J27 for a total flow of $Q_5 = 25$ CFS, $Q_{100} = 69$ CFS conveyed via a 42" RCP.
- Basin H10 (5.0 acres, $Q_5 = 8.2$ CFS, $Q_{100} = 18$ CFS) contains lots along the north side of WindingWalk Dr. and rear lots along the west side of Rainbow Bridge Drive. The surface runoff will sheet flow off of the residential lots and be conveyed to an existing 10' Type R forced sump inlet located at I24. Most of the flow is captured by this inlet ($Q_5 = 8.2$ CFS, $Q_{100} = 11$ CFS) is conveyed via an existing 18" RCP to J28 where it will combine with the pipe flow from I25 and J27. The remaining surface runoff ($Q_{100} = 7.0$ CFS) continues along the curb and gutter southerly along Rainbow Bridge toward an existing inlet located within WindingWalk Filing 1.
- Basin H11 (2.0 acres, $Q_5 = 3.8$ CFS, $Q_{100} = 11$ CFS) contains the lots in Stonebridge Filing 4 and WindingWalk Filing 2 along with the east side of Rainbow Bridge Dr. The surface runoff will sheet flow off of the residential lots and be conveyed to an existing 10' Type R forced sump inlet located at I25. Most of the flow captured by this inlet ($Q_5 = 3.8$ CFS, $Q_{100} = 11$ CFS) is conveyed via an 18" RCP to J28 where it will combine with the pipe flow from I25 and J27. The remaining surface runoff ($Q_{100} = 0.3$ CFS) continues along the curb and gutter southerly along Rainbow Bridge toward an existing inlet located within WindingWalk Filing 1.
- The pipe flow conveyed to Junction J28 from J27, I24 and I25 is combined for a total flow of $Q_5 = 33$ CFS, $Q_{100} = 89$ CFS conveyed via a 42" RCP downstream along Rainbow Bridge Dr through WindingWalk Filing 1 toward existing Pond H.

Gieck Ranch

- Basin G01 (2.7 acres, $Q_5 = 4.6$ CFS, $Q_{100} = 11$ CFS) contains lots fronting along the west side of Hidden Ranch Ct within Stonebridge Filing 4, the surface runoff will sheet flow off of the residential lots and be conveyed via curb and gutter to DP10.
- Basin G02 (4.4 acres, $Q_5 = 6.0$ CFS, $Q_{100} = 14$ CFS) contains lots fronting along the east side of Hidden Ranch Ct within Stonebridge Filing 4, the surface runoff will sheet flow off of the residential lots and is combined with the surface flow from DP10 then is conveyed to a proposed 10' Type R sump inlet located at I40. Most of the flow is captured by this inlet ($Q_5 = 9.7$ CFS, $Q_{100} = 18$ CFS) is conveyed via a proposed RCP to I41 where it will combine with the pipe flow from I41. The remaining surface runoff ($Q_{100} = 4.3$ CFS) crosses the centerline toward I41.

- Basin G03 (1.2 acres, $Q_5 = 2.1$ CFS, $Q_{100} = 4.8$ CFS) contains lots fronting along the south side of Ranch Gate Tr within Stonebridge Filing 4, the surface runoff will sheet flow off of the residential lots and is combined with the surface flow from I40 at a proposed 10' Type R sump inlet located at I41. All of the flow captured by this inlet is conveyed via a proposed RCP to a proposed storm drain end section (OS5) where it will discharge into an existing swale constructed with Stonebridge Filing 3 (Basin E02) at DP12. Should both sump inlets (I40 & I41) at this location become clogged, the side yard is able to safely convey the total Q_{100} flow of 26 CFS through the rear yard to the open space.
- Basin E02 (11 acres, $Q_5 = 11$ CFS, $Q_{100} = 27$ CFS) contains rear lots along the south side of existing Stone Valley Dr in Stonebridge Filing 3 and along the east side of Hidden Ranch Ct within Stonebridge Filing 4, the surface runoff will sheet flow off of the residential lots and be conveyed via an existing swale to DP12 for a total flow of 11 acres, $Q_5 = 17$ CFS, $Q_{100} = 42$ CFS. The surface flow will continue downstream toward the Vistas Filing 1 where it will be collected and conveyed through an existing storm drain system to the existing Pond E.

DETENTION PONDS

Bennett Regional Detention Pond

The Bennett Regional Detention Pond was constructed with in 2001 and was designed to accept the developed flows from Woodmen Hills Filing 11 and all the portions of Meridian Ranch that lies within the Bennett Ranch Drainage Basin. The developed flow rates were to be released from the pond at rates less than 80% of the historic flow rates. The water quality component was sized to accommodate the tributary areas from Woodmen Hills Filing 11 and Meridian Ranch.

The development of the Stonebridge Filing 4 PUD will complete the tributary areas to the Bennett Regional Pond within the Meridian Ranch Development. No improvements or modifications are necessary to this pond as a result of the development of Stonebridge Filing 4. The table below shows the ultimate release rates from the detention pond in comparison to the historic flow rates.

Table 6: Bennett Regional Detention Pond Summary Data

| BENNETT REGIONAL DETENTION POND | | | | | | |
|---------------------------------|----------------|-----------------|-----------------|------------------|-----------------|-------------------|
| | PEAK INFLOW | PEAK OUTFLOW | TOTAL INFLOW | TOTAL OUTFLOW | PEAK STORAGE | PEAK ELEVATION |
| | CFS | CFS | AC-FT | AC-FT | AC-FT | FT |
| INTERIM and FUTURE CONDITIONS | | | | | | |
| 5-YEAR STORM | 251 | 95 | 71 | 64 | 18.0 | 6969.8 |
| 10-YEAR STORM | 414 | 235 | 119 | 110 | 29.7 | 6970.7 |
| 25-YEAR STORM | 736 | 571 | 207 | 194 | 47.4 | 6971.7 |
| 50-YEAR STORM | 1209 | 950 | 292 | 275 | 63.8 | 6972.6 |
| 100-YEAR STORM | 1751 | 1365 | 396 | 376 | 84.4 | 6973.7 |

Pond H Detention Storage Criteria

Detention Pond H was constructed as a part of the WindingWalk grading in anticipation of the future development of WindingWalk and the Stonebridge Filing 4 PUD in accordance with the approved Sketch Plan. The existing pond is located within the Haegler Ranch Drainage Basin in the southeastern corner of Meridian Ranch near the intersection of Eastonville Road and Stapleton Drive. The pond is owned and maintained by the Meridian Service Metropolitan District (MSMD). A maintenance agreement between the Meridian Service Metropolitan District and El Paso County has been recorded with the WindingWalk Filing 1 final plat.

The pond is designed to accommodate the developed final inflow from WindingWalk Filings 1 and 2 at Meridian Ranch and Stonebridge Filing 4. Permanent concrete control structures has been designed to handle full build out of the tributary area and reduce the developed flows to at or below the historic full spectrum peak flow rates. No improvements or modifications are necessary to this pond as a result of the development of Stonebridge Flg. 4.

A WQCV analysis for Pond H was also performed based on proposed future development of the proposed tributary area to the pond; this analysis shows that Pond H will require 0.5 acre-ft of storage for first flush water quality for all the areas tributary to the pond. The control structure at DP H12 is proposed to consist of a 6" water quality control riser with a trash grate having a top elevation of 6970.0 to achieve the required 0.5 ac-ft of storage.

The WQCV was calculated by using the equations found in Volume 2, of the Drainage Criteria Manual (DCM). The release rate from the WQCV is generally very small, which helps minimize downstream impacts. Detaining the WQCV also serves to cleanse the "first flush" of runoff from the higher initial concentration of sediment and pollutants by allowing for settlement to occur. This greatly improves the quality of runoff, leaving the facility and reduces the potential for erosion. The positive impact on water quality is expected to be significant, particularly during the construction phase of the development.

The existing concrete control structure the outlet of Pond H will attenuate the peak developed flow rates to historic peak rates or less for the full spectrum of design storms as per the requirements set forth in Resolution 15-042 adopted by the Board of County Commissioners, County of El Paso. The control structure consists of a water quality control standpipe, a rectangular slotted orifice located on the front and a grated top to reduce the developed peak flow rates. Table 6 provides summary data for the various design storms for the completed development for all areas tributary to Pond H including Stonebridge Filing 4.

Table 7: Pond H Summary Data

| | POND H | | | | | |
|-------------------------------|--------------------|---------------------|-----------------------|------------------------|-----------------------|----------------------|
| | PEAK INFLOW CFS | PEAK OUTFLOW CFS | TOTAL INFLOW AC-FT | TOTAL OUTFLOW AC-FT | PEAK STORAGE AC-FT | PEAK ELEVATION FT |
| INTERIM and FUTURE CONDITIONS | | | | | | |
| 5-YEAR STORM | 34 | 3.1 | 4.5 | 2.7 | 2.8 | 6971.7 |
| 10-YEAR STORM | 54 | 7.8 | 6.7 | 4.7 | 3.7 | 6972.1 |
| 25-YEAR STORM | 87 | 18 | 10.5 | 7.9 | 5.1 | 6972.6 |
| 50-YEAR STORM | 117 | 32 | 14.0 | 11.3 | 6.5 | 6973.1 |
| 100-YEAR STORM | 153 | 57 | 18.1 | 15.2 | 7.7 | 6973.4 |

Existing Pond E Detention Storage Criteria

Existing Detention Pond E is located south of Londonderry and west of Eastonville, and was constructed as a part of the Meridian Ranch Filing 11 Grading, is owned and maintained by the Meridian Service Metropolitan District (MSMD). It has been in operation since 2013 with no reported issues. A maintenance agreement between the Meridian Service Metropolitan District and El Paso County has been recorded as a part of the Meridian Ranch Filing 11A Final Plat process.

The SCS calculation method was used to determine inflow and outflow from the detention pond to ensure the developed runoff does not overcharge the pond and the discharges do not adversely impact drainage patterns downstream of Eastonville Road. Storm drainage runoff will enter the pond from upstream development via an existing pipe network and overland from existing rear lots of the Vistas Filing 1 at Meridian Ranch. The ultimate future build-out design of the tributary areas was analyzed to insure the sizing of the pond would be adequate after development of Meridian Ranch is complete. This SCS calculation can be found in the appendix.

An analysis of the SCS calculations show that with the permanent concrete control structures, recently installed with the operations associated with the WindingWalk Grading permit the developed flow rates are reduced to at or below the historic flow rates at Eastonville Road. The temporary CMP control structures installed at the time of the original pond construction with the Meridian Ranch Filing 11 grading operations were replaced with permanent concrete control structures. No additional improvements or modifications are necessary to this pond as a result of the development of Stonebridge Filing 4.

Table 8: Existing Pond E Summary Data

| POND E | | | | | | |
|--------------------|----------------|-----------------|-----------------|------------------|-----------------|-------------------|
| | PEAK INFLOW | PEAK OUTFLOW | TOTAL INFLOW | TOTAL OUTFLOW | PEAK STORAGE | PEAK ELEVATION |
| | CFS | CFS | AC-FT | AC-FT | AC-FT | FT |
| INTERIM CONDITIONS | | | | | | |
| 5-YEAR STORM | 114 | 12 | 24.6 | 10.1 | 16.1 | 6971.2 |
| 10-YEAR STORM | 174 | 25 | 38.4 | 20.1 | 21.5 | 6971.7 |
| 25-YEAR STORM | 276 | 61 | 61.7 | 39.7 | 27.9 | 6972.3 |
| 50-YEAR STORM | 373 | 119 | 84.9 | 61.7 | 33.5 | 6972.8 |
| 100-YEAR STORM | 484 | 199 | 112.6 | 88.6 | 39.5 | 6973.3 |
| FUTURE CONDITIONS | | | | | | |
| 5-YEAR STORM | 126 | 16 | 29.0 | 13.1 | 17.9 | 6971.4 |
| 10-YEAR STORM | 198 | 30 | 43.9 | 24.6 | 23.0 | 6971.9 |
| 25-YEAR STORM | 321 | 81 | 69.4 | 47.1 | 30.1 | 6972.5 |
| 50-YEAR STORM | 435 | 151 | 94.1 | 70.8 | 36.2 | 6973.1 |
| 100-YEAR STORM | 609 | 240 | 123.4 | 99.4 | 42.2 | 6973.6 |

A water quality capture volume (WQCV) was added to the required storage volume for the final build out condition. The purpose of the WQCV is to allow particulates to settle out and accumulate over time to improve water quality and to maintain full volume for detention during the life of the facility for a major storm event. The WQCV of 1.6 ac-ft. was added to

the detention of the minor storm and half (0.8 ac-ft.) was added to the detention volume of the major storm. This was accomplished with respect to the HEC-HMS computer run by providing a starting detention volume of 1.6 ft. for the 5-year storm and 0.8 ft. for the 100-year storm. The resulting storage elevations remain well below the emergency spillway elevation. See Appendix B for more information.

The WQCV was calculated by using the equations found in Volume 2, of the Drainage Criteria Manual (DCM). The release rate from the WQCV is generally very small, which helps minimize downstream impacts. Detaining the WQCV also serves to cleanse the “first flush” of runoff from the higher initial concentration of sediment and pollutants by allowing for settlement to occur. This greatly improves the quality of runoff, leaving the facility and reduces the potential for erosion. The positive impact on water quality is expected to be significant, particularly during the construction phase of the development.

Downstream Analysis

The facilities located downstream of SCS Basin DB28 are the Bennett Regional Detention Pond and the North Channel running between Stapleton Drive and the Bennett Pond. The pond and channel were originally designed and constructed with Woodmen Hills Filings 10 & 11 and the channel was reconstructed in 2008. With the completion of the WindingWalk and the Stonebridge Filing 4 PUDs the areas within Meridian Ranch tributary to the Bennett Regional Pond and the North Channel will be complete.

The Bennett Regional Detention Pond design provides detention and water quality for all Bennett Ranch Drainage Basin areas tributary to the pond within Woodmen Hills and Meridian Ranch. The analysis of the Bennett Pond shows the pond has sufficient capacity during the 100-yr storm event to accept the runoff from the upstream developed tributary areas and the release rates from the pond for the full spectrum of design storms are acceptable.

The channel was redesigned and reconstructed as a rip-rap lined channel with multiple drop structures between Stapleton and the detention pond. The channel crosses under Lambert Road and has a carrying capacity of 1,930 CFS with an average velocity of 5.0 FPS. The final 100-yr design flow rate for the North Channel 1,650 CFS with an average velocity of 4.7 FPS, both the flow rate and velocity are below the original design parameters. The existing channel shows no significant signs of degradation from the flows over the past 10 years. Based on the above analysis the development of those portions of the WindingWalk and the Stonebridge Filing 4 PUDs tributary to the Bennett Ranch Drainage Basin will have no adverse impacts to the downstream facilities.

The outlets (DP H08 & H09) for Pond E located along Eastonville Road upstream of 4-Way Ranch Filing 1 were analyzed in detail with the 2018 MDDP associated with the most recent Meridian Ranch Sketch Plan Amendment. The information can be found in Appendix D of the January 2018 Meridian Ranch MDDP. Below you will find a summary table providing release rates of flow for each Pond E outlet. See the Downstream Channel Analysis Appendix in the WindingWalk Filing 1 Final Drainage Report for a letter to the El Paso County Engineer regarding channel stability and analysis.

The outlet (DP H12) for Pond H is located northwest of the intersection of Eastonville Road and Stapleton Drive and upstream of 4-Way Ranch Filing 1. Pond H will discharge 58 CFS during the 100-yr storm event into an existing sedimentation/detention pond constructed with a concrete sedimentation control structure and connected to a 4' x 2' RCB installed with the construction of Stapleton Drive. The plans set, prepared by URS in 2007, indicates the anticipated flow conveyed by the storm drain to be 87 CFS. A quick analysis indicates the 58 CFS will travel through the box culvert at an average velocity of 9 FPS under normal flow.

See the Downstream Channel Analysis Appendix in the WindingWalk Filing 1 Final Drainage Report for the hydraulic profile of the RCB storm drain.

The original 4-Way Ranch calculations show the anticipated flow from Meridian Ranch to be approximately 100 CFS, the Stapleton Drive Improvement Plans show an discharge of 110 CFS from the above mentioned RCB storm drain. The calculations show the discharge from Pond H to be 58 CFS and the discharge from the RCB storm drain to be 63 CFS with a discharge velocity of 8 FPS. The storm drain discharges into an existing natural broad bottomed swale and the swale conveys the flow downstream at an average non-erosive velocity of 3.2 FPS for the 100-yr event. See the Downstream Channel Analysis Appendix in the WindingWalk Filing 1 Final Drainage Report for the hydraulic worksheets for the downstream channel.

In the event Pond H should overtop the embankment and run through the emergency spillway, the overflow would be conveyed safely down the embankment toward the existing box inlet located north of Stapleton Drive. After a portion of the flow is captured by the inlet the remainder will enter Stapleton Drive and cross both Stapleton Drive and Eastonville Road to the southeast side of the intersection and continue downstream in the existing natural channel.

EROSION CONTROL DESIGN

General Concept

Historically, erosion on this property has been held to a minimum by a variety of natural features and agricultural practices including:

- Substantial prairie grass growth
- Construction of drainage arresting berms
- Construction of multiple stock ponds along drainage courses

Existing temporary sediment ponds will also help to minimize erosion by reducing both the volume and velocity of the peak runoff.

During construction, best management practices (BMP) for erosion control will be employed based on El Paso county Criteria. BMP's will be utilized as deemed necessary by the contractor and/or engineer and are not limited to the measures shown on the construction drawing set. The contractor shall minimize the amount of area disturbed during all construction activities.

In general the following shall be applied in developing the sequence of major activities:

- Install down-slope and side-slope perimeter BMP's before the land disturbing activity occurs.
- Do not disturb an area until it is necessary for the construction activity to proceed
- Cover or stabilize as soon as possible.
- Time the construction activities to reduce the impacts from seasonal climatic changes or weather events.
- The construction of filtration BMP's should wait until the end of the construction project when upstream drainage areas have been stabilized.
- Do not remove the temporary perimeter controls until after all upstream areas are stabilized.

Four Step Process

The following four step process is recommended for selecting structural BMP's in developing urban areas:

Step 1: Employ Runoff Reduction Practices

This development incorporates wider rights-of-way than other developments, thus decreasing the amount area devoted to pavement. The rights-of-way within Meridian Ranch are 20% wider, 60 ft. instead of 50 ft., creating more landscaped area within the development.

The project has over ten acres of open space, accounting for over 20% of the entire project, creating a lower density development.

Home owners and builders are encouraged to direct roof drains to the sidyards where the runoff will travel overland to the streets and creating an opportunity to allow the runoff to infiltrate into the ground.

Step 2: Stabilize Drainageways

The drainage swale located adjacent and south of the project was designed to have a wide flat bottom and slope reducing the velocity of the concentrated flow traveling along the drainageway. The construction of the swale also included erosion control mat along the entire length of the swale. At steeper sections of the swale straw logs or rip-rap has been installed to reduce velocities and erosion.

Step 3: Provide Water Quality Capture Volume (WQCV)

An existing extended detention pond with water quality capture volume is located to the east of the project that was designed to accommodate the runoff from this development.

Step 4: Consider Need for Industrial and Commercial BMP's

This project is neither industrial nor commercial and therefore this section does not apply.

Temporary Sedimentation Pond

Temporary sedimentation ponds installed during the overlot grading process will act as the primary water quality control for the areas upstream. Runoff will travel overland toward the existing sedimentation ponds, collected and diverted into the proposed storm drain system and discharged into existing downstream systems. The pond will provide initial sediment control over exposed upstream areas.

Detention Pond

The detention ponds will act as the primary water quality control for the areas within the project boundaries. Runoff will be collected by the proposed storm drainage system and diverted into the detention pond where practical. The pond will serve a dual purpose: first, by facilitating the settling of sediment in runoff during and after construction (by means of the WQCV) and, second, by maintaining runoff at or below existing levels.

Silt Fence

Silt fence will be place along downstream limits of disturbed areas. This will prevent suspended sediment from leaving the site during infrastructure construction. Silt fencing is to remain in place until vegetation is reestablished.

Erosion Bales

Erosion bales will be placed ten (10) feet from the inlet of all culverts during construction to prevent culverts from filling with sediment. Erosion bales will remain in place until vegetation is reestablished. Erosion bale checks will be used on slopes greater than 1 percent to reduce flow velocities until vegetation is reestablished.

Miscellaneous

Best erosion control practices will be utilized as deemed necessary by the Contractor or Engineer and are not limited to the measures described above.

DRAINAGE FEES

The proposed Stonebridge Filing 4 development is located within three major drainage basins; the Bennett Ranch, the Haegler Ranch, and the Gieck Ranch Drainage Basins. Of the 68.9 acres of Stonebridge Filing 4, 32.5 acres fall within the Bennett Ranch Basin, 17.4 acres is located within the Haegler Ranch Basin, and 17.9 acres is located within the Gieck Ranch Basin. The Bennett Ranch portion includes 20.8 acres of residential development and 5.5 acres are designated as right-of-way, and 6.2 acres landscape tract. The portion within the Haegler Ranch includes 11.6 acres of residential development and 3.8 acres designated as right-of-way, and 2.0 acres landscape tract. See the calculation below.

The following is the imperviousness calculation:

BENNETT RANCH

| | <u>Acres</u> | <u>Assumed Imperviousness</u> | <u>Impervious Acres</u> |
|------------------|--------------|-------------------------------|-------------------------|
| Right-of-way | 5.5 | 85% | 4.7 |
| Residential Lots | 20.8 | 52% | 10.8 |
| Landscape Tract | 6.2 | 5% | 0.3 |
| Total | 32.5 | | 26.7 = 48.6% imp. |

Bennett Ranch

Drainage Basin Fees: 32.5 ac* \$ 10,832/Ac*0.486 Imp Area = \$ 171,091.00

Meridian Ranch holds Bridge Fee credits for the construction of the Stapleton Drive bridge constructed in 2007, these credits are to be applied against the bridge fee requirements associated with this project.

| | |
|------------------------------------|--|
| Bridge Fees: | 32.5 ac* \$ 4,155/Ac*0.486 Imp Area = \$ 65,282.00 |
| Existing Credits: | \$ -432,526.93 |
| Bridge Fee Paid at Plat Recording: | \$ 0.00 |
| Remaining Credits | \$ -367,244.93 |

HAEGLER RANCH

| | <u>Acres</u> | <u>Assumed Imperviousness</u> | <u>Impervious Acres</u> |
|------------------|--------------|-------------------------------|-------------------------|
| Right-of-way | 3.8 | 85% | 3.2 |
| Residential Lots | 11.6 | 52% (73 Lots) | 6.0 |
| Landscape Tract | 2.0 | 5% | 0.1 |
| Total | 17.4 | | 9.3 = 53.4% imp. |

Pond H is identified in the approved Haegler Basin Planning Study as Sub-regional Detention Pond SR-01 and is reimbursable to developer after construction. Pond H was constructed as a part of WindingWalk Filing 1 and a final credit amount is yet to be determined at the writing of this report. If any credit is remaining from the construction of Pond H at the time of recordation of Stonebridge Filing 4, that credit will offset the calculated drainage basin fees listed below.

Haegler Ranch

Drainage Basin Fees: 17.4 ac* $\$ 9,676/Ac$ *0.534 Imp Area = $\$ 89,906.00$

Bridge Fees: 17.4 ac* $\$ 1,428/Ac$ *0.534 Imp Area = $\$ 13,268.00$

GIECK RANCH

There are no drainage or bridge fees associated with the Gieck Ranch Drainage Basin.

| | | | | | | | | | | | | | | | 385 |

Notes: 1) Top-of-bank and spillway flows are weir equations from section 11.3.1 in the DCM. $Q = CLH^{1.5}$ ($C=3.0$)

2) Orifice flows are also from section 11.3.1. $Q = CA(2gH)^{0.5}$ ($C=.6$)

3) Grate flows are determined from equations 7-2 and 7-3. Weir Flow $Q = (3PH^{1.5})/F$, Orifice Flow $Q = 4.815 * AH^{0.5}$

4) Pipe flows use the lesser of: 1) Inlet control equations 27 & 28, page 146 of HDS No. 5 - or - 2) Allowable Pipe Flow equation on page 11-9 of the DCM. Use Table 9, page 147-148, HDS No. 5 for formulas 26 & 27.

Notes: 1) Top-of-bank and spillway flows are weir equations from section 11.3.1 in the DCM. $Q=CLH^{1.5}$ ($C=3.0$)

2) Orifice flows are also from section 11.3.1. $Q=CA(2gH)^{0.5}$ ($C=.6$)

3) Grate flows are determined from equations 7-2 and 7-3. Weir Flow $Q=(3PH^{1.5})/F$, Orifice Flow $Q=4.815*AH^{0.5}$

4) Pipe flows use the lesser of: 1) Inlet control equations 27 & 28, page 146 of HDS No. 5 - or - 2) Allowable Pipe Flow equation on page 11-9 of the DCM. Use Table 9, page 147-148, HDS No. 5 for formulas 26 & 27.

Notes: 1) Top-of-bank and spillway flows are weir equations from section 11.3.1 in the DCM. $Q=CLH^{1.5}$ ($C=3.0$)

2) Orifice flows are also from section 11.3.1. $Q=CA(2gH)^{0.5}$ ($C=.6$)

3) Grate flows are determined from equations 7-2 and 7-3. Weir Flow $Q=(3PH^{1.5})/F$, Orifice Flow $Q=4.815*AH^{0.5}$)

4) Pipe flows use the lesser of: 1) Inlet control equations 27 & 28, page 146 of HDS No. 5 - or - 2) Allowable Pipe Flow equation on page 11-9 of the DCM. Use Table 9, page 147-148, HDS No. 5 for formulas 26 & 27.

STAGE/STORAGE/DISCHARGE CURVES FOR DETENTION POND ANALYSIS

Appendix E – Overflow Analysis

Worksheet for Sump Inlets 4 & 5

Project Description

Friction Method Manning Formula
Solve For Normal Depth

Input Data

| | |
|-----------------------|--------------------------|
| Roughness Coefficient | 0.035 |
| Channel Slope | 0.02000 ft/ft |
| Left Side Slope | 10.00 ft/ft (H:V) |
| Right Side Slope | 10.00 ft/ft (H:V) |
| Discharge | 29.00 ft ³ /s |

Results

| | |
|------------------|----------------------|
| Normal Depth | 0.91 ft |
| Flow Area | 8.21 ft ² |
| Wetted Perimeter | 18.21 ft |
| Hydraulic Radius | 0.45 ft |
| Top Width | 18.12 ft |
| Critical Depth | 0.88 ft |
| Critical Slope | 0.02364 ft/ft |
| Velocity | 3.53 ft/s |
| Velocity Head | 0.19 ft |
| Specific Energy | 1.10 ft |
| Froude Number | 0.93 |
| Flow Type | Subcritical |

GVF Input Data

| | |
|------------------|---------|
| Downstream Depth | 0.00 ft |
| Length | 0.00 ft |
| Number Of Steps | 0 |

GVF Output Data

| | |

Windingwalk and the Enclave

Preface

Soil surveys contain information that affects land use planning in survey areas. They highlight soil limitations that affect various land uses and provide information about the properties of the soils in the survey areas. Soil surveys are designed for many different users, including farmers, ranchers, foresters, agronomists, urban planners, community officials, engineers, developers, builders, and home buyers. Also, conservationists, teachers, students, and specialists in recreation, waste disposal, and pollution control can use the surveys to help them understand, protect, or enhance the environment.

Various land use regulations of Federal, State, and local governments may impose special restrictions on land use or land treatment. Soil surveys identify soil properties that are used in making various land use or land treatment decisions. The information is intended to help the land users identify and reduce the effects of soil limitations on various land uses. The landowner or user is responsible for identifying and complying with existing laws and regulations.

Although soil survey information can be used for general farm, local, and wider area planning, onsite investigation is needed to supplement this information in some cases. Examples include soil quality assessments (<http://www.nrcs.usda.gov/wps/portal/nrcs/main/soils/health/>) and certain conservation and engineering applications. For more detailed information, contact your local USDA Service Center (<https://offices.sc.egov.usda.gov/locator/app?agency=nrcs>) or your NRCS State Soil Scientist (http://www.nrcs.usda.gov/wps/portal/nrcs/detail/soils/contactus/?cid=nrcs142p2_053951).

Great differences in soil properties can occur within short distances. Some soils are seasonally wet or subject to flooding. Some are too unstable to be used as a foundation for buildings or roads. Clayey or wet soils are poorly suited to use as septic tank absorption fields. A high water table makes a soil poorly suited to basements or underground installations.

The National Cooperative Soil Survey is a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local agencies. The Natural Resources Conservation Service (NRCS) has leadership for the Federal part of the National Cooperative Soil Survey.

Information about soils is updated periodically. Updated information is available through the NRCS Web Soil Survey, the site for official soil survey information.

The U.S. Department of Agriculture (USDA) prohibits discrimination in all its programs and activities on the basis of race, color, national origin, age, disability, and where applicable, sex, marital status, familial status, parental status, religion, sexual orientation, genetic information, political beliefs, reprisal, or because all or a part of an individual's income is derived from any public assistance program. (Not all prohibited bases apply to all programs.) Persons with disabilities who require

alternative means for communication of program information (Braille, large print, audiotape, etc.) should contact USDA's TARGET Center at (202) 720-2600 (voice and TDD). To file a complaint of discrimination, write to USDA, Director, Office of Civil Rights, 1400 Independence Avenue, S.W., Washington, D.C. 20250-9410 or call (800) 795-3272 (voice) or (202) 720-6382 (TDD). USDA is an equal opportunity provider and employer.

How Soil Surveys Are Made

Soil surveys are made to provide information about the soils and miscellaneous areas in a specific area. They include a description of the soils and miscellaneous areas and their location on the landscape and tables that show soil properties and limitations affecting various uses. Soil scientists observed the steepness, length, and shape of the slopes; the general pattern of drainage; the kinds of crops and native plants; and the kinds of bedrock. They observed and described many soil profiles. A soil profile is the sequence of natural layers, or horizons, in a soil. The profile extends from the surface down into the unconsolidated material in which the soil formed or from the surface down to bedrock. The unconsolidated material is devoid of roots and other living organisms and has not been changed by other biological activity.

Currently, soils are mapped according to the boundaries of major land resource areas (MLRAs). MLRAs are geographically associated land resource units that share common characteristics related to physiography, geology, climate, water resources, soils, biological resources, and land uses (USDA, 2006). Soil survey areas typically consist of parts of one or more MLRA.

The soils and miscellaneous areas in a survey area occur in an orderly pattern that is related to the geology, landforms, relief, climate, and natural vegetation of the area. Each kind of soil and miscellaneous area is associated with a particular kind of landform or with a segment of the landform. By observing the soils and miscellaneous areas in the survey area and relating their position to specific segments of the landform, a soil scientist develops a concept, or model, of how they were formed. Thus, during mapping, this model enables the soil scientist to predict with a considerable degree of accuracy the kind of soil or miscellaneous area at a specific location on the landscape.

Commonly, individual soils on the landscape merge into one another as their characteristics gradually change. To construct an accurate soil map, however, soil scientists must determine the boundaries between the soils. They can observe only a limited number of soil profiles. Nevertheless, these observations, supplemented by an understanding of the soil-vegetation-landscape relationship, are sufficient to verify predictions of the kinds of soil in an area and to determine the boundaries.

Soil scientists recorded the characteristics of the soil profiles that they studied. They noted soil color, texture, size and shape of soil aggregates, kind and amount of rock fragments, distribution of plant roots, reaction, and other features that enable them to identify soils. After describing the soils in the survey area and determining their properties, the soil scientists assigned the soils to taxonomic classes (units).

Taxonomic classes are concepts. Each taxonomic class has a set of soil characteristics with precisely defined limits. The classes are used as a basis for comparison to classify soils systematically. Soil taxonomy, the system of taxonomic classification used in the United States, is based mainly on the kind and character of soil properties and the arrangement of horizons within the profile. After the soil

Custom Soil Resource Report

scientists classified and named the soils in the survey area, they compared the individual soils with similar soils in the same taxonomic class in other areas so that they could confirm data and assemble additional data based on experience and research.

The objective of soil mapping is not to delineate pure map unit components; the objective is to separate the landscape into landforms or landform segments that have similar use and management requirements. Each map unit is defined by a unique combination of soil components and/or miscellaneous areas in predictable proportions. Some components may be highly contrasting to the other components of the map unit. The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The delineation of such landforms and landform segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, onsite investigation is needed to define and locate the soils and miscellaneous areas.

Soil scientists make many field observations in the process of producing a soil map. The frequency of observation is dependent upon several factors, including scale of mapping, intensity of mapping, design of map units, complexity of the landscape, and experience of the soil scientist. Observations are made to test and refine the soil-landscape model and predictions and to verify the classification of the soils at specific locations. Once the soil-landscape model is refined, a significantly smaller number of measurements of individual soil properties are made and recorded. These measurements may include field measurements, such as those for color, depth to bedrock, and texture, and laboratory measurements, such as those for content of sand, silt, clay, salt, and other components. Properties of each soil typically vary from one point to another across the landscape.

Observations for map unit components are aggregated to develop ranges of characteristics for the components. The aggregated values are presented. Direct measurements do not exist for every property presented for every map unit component. Values for some properties are estimated from combinations of other properties.

While a soil survey is in progress, samples of some of the soils in the area generally are collected for laboratory analyses and for engineering tests. Soil scientists interpret the data from these analyses and tests as well as the field-observed characteristics and the soil properties to determine the expected behavior of the soils under different uses. Interpretations for all of the soils are field tested through observation of the soils in different uses and under different levels of management. Some interpretations are modified to fit local conditions, and some new interpretations are developed to meet local needs. Data are assembled from other sources, such as research information, production records, and field experience of specialists. For example, data on crop yields under defined levels of management are assembled from farm records and from field or plot experiments on the same kinds of soil.

Predictions about soil behavior are based not only on soil properties but also on such variables as climate and biological activity. Soil conditions are predictable over long periods of time, but they are not predictable from year to year. For example, soil scientists can predict with a fairly high degree of accuracy that a given soil will have a high water table within certain depths in most years, but they cannot predict that a high water table will always be at a specific level in the soil on a specific date.

After soil scientists located and identified the significant natural bodies of soil in the survey area, they drew the boundaries of these bodies on aerial photographs and

Custom Soil Resource Report

identified each as a specific map unit. Aerial photographs show trees, buildings, fields, roads, and rivers, all of which help in locating boundaries accurately.

Soil Map

The soil map section includes the soil map for the defined area of interest, a list of soil map units on the map and extent of each map unit, and cartographic symbols displayed on the map. Also presented are various metadata about data used to produce the map, and a description of each soil map unit.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service

Web Soil Survey URL:

Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: El Paso County Area, Colorado

Survey Area Data: Version 15, Oct 10, 2017

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: May 22, 2016—Mar 9, 2017

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Map Unit Legend

| Map Unit Symbol | Map Unit Name | Acres in AOI | Percent of AOI |

| 19 | Columbine gravelly sandy loam, 0 to 3 percent slopes | 15.8 | 5.5% |
| 83 | Stapleton sandy loam, 3 to 8 percent slopes | 272.3 | 94.5% |
| Totals for Area of Interest | | 288.1 | 100.0% |

Map Unit Descriptions

The map units delineated on the detailed soil maps in a soil survey represent the soils or miscellaneous areas in the survey area. The map unit descriptions, along with the maps, can be used to determine the composition and properties of a unit.

A map unit delineation on a soil map represents an area dominated by one or more major kinds of soil or miscellaneous areas. A map unit is identified and named according to the taxonomic classification of the dominant soils. Within a taxonomic class there are precisely defined limits for the properties of the soils. On the landscape, however, the soils are natural phenomena, and they have the characteristic variability of all natural phenomena. Thus, the range of some observed properties may extend beyond the limits defined for a taxonomic class. Areas of soils of a single taxonomic class rarely, if ever, can be mapped without including areas of other taxonomic classes. Consequently, every map unit is made up of the soils or miscellaneous areas for which it is named and some minor components that belong to taxonomic classes other than those of the major soils.

Most minor soils have properties similar to those of the dominant soil or soils in the map unit, and thus they do not affect use and management. These are called noncontrasting, or similar, components. They may or may not be mentioned in a particular map unit description. Other minor components, however, have properties and behavioral characteristics divergent enough to affect use or to require different management. These are called contrasting, or dissimilar, components. They generally are in small areas and could not be mapped separately because of the scale used. Some small areas of strongly contrasting soils or miscellaneous areas are identified by a special symbol on the maps. If included in the database for a given area, the contrasting minor components are identified in the map unit descriptions along with some characteristics of each. A few areas of minor components may not have been observed, and consequently they are not mentioned in the descriptions, especially where the pattern was so complex that it was impractical to make enough observations to identify all the soils and miscellaneous areas on the landscape.

The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The objective of mapping is not to delineate pure taxonomic classes but rather to separate the landscape into landforms or landform segments that have similar use and management requirements. The delineation of such segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, however,

onsite investigation is needed to define and locate the soils and miscellaneous areas.

An identifying symbol precedes the map unit name in the map unit descriptions. Each description includes general facts about the unit and gives important soil properties and qualities.

Soils that have profiles that are almost alike make up a *soil series*. Except for differences in texture of the surface layer, all the soils of a series have major horizons that are similar in composition, thickness, and arrangement.

Soils of one series can differ in texture of the surface layer, slope, stoniness, salinity, degree of erosion, and other characteristics that affect their use. On the basis of such differences, a soil series is divided into *soil phases*. Most of the areas shown on the detailed soil maps are phases of soil series. The name of a soil phase commonly indicates a feature that affects use or management. For example, Alpha silt loam, 0 to 2 percent slopes, is a phase of the Alpha series.

Some map units are made up of two or more major soils or miscellaneous areas. These map units are complexes, associations, or undifferentiated groups.

A *complex* consists of two or more soils or miscellaneous areas in such an intricate pattern or in such small areas that they cannot be shown separately on the maps. The pattern and proportion of the soils or miscellaneous areas are somewhat similar in all areas. Alpha-Beta complex, 0 to 6 percent slopes, is an example.

An *association* is made up of two or more geographically associated soils or miscellaneous areas that are shown as one unit on the maps. Because of present or anticipated uses of the map units in the survey area, it was not considered practical or necessary to map the soils or miscellaneous areas separately. The pattern and relative proportion of the soils or miscellaneous areas are somewhat similar. Alpha-Beta association, 0 to 2 percent slopes, is an example.

An *undifferentiated group* is made up of two or more soils or miscellaneous areas that could be mapped individually but are mapped as one unit because similar interpretations can be made for use and management. The pattern and proportion of the soils or miscellaneous areas in a mapped area are not uniform. An area can be made up of only one of the major soils or miscellaneous areas, or it can be made up of all of them. Alpha and Beta soils, 0 to 2 percent slopes, is an example.

Some surveys include *miscellaneous areas*. Such areas have little or no soil material and support little or no vegetation. Rock outcrop is an example.

El Paso County Area, Colorado

19—Columbine gravelly sandy loam, 0 to 3 percent slopes

Map Unit Setting

National map unit symbol: 367p
Elevation: 6,500 to 7,300 feet
Mean annual precipitation: 14 to 16 inches
Mean annual air temperature: 46 to 50 degrees F
Frost-free period: 125 to 145 days
Farmland classification: Not prime farmland

Map Unit Composition

Columbine and similar soils: 85 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Columbine

Setting

Landform: Fan terraces, fans, flood plains
Down-slope shape: Linear
Across-slope shape: Linear
Parent material: Alluvium

Typical profile

A - 0 to 14 inches: gravelly sandy loam
C - 14 to 60 inches: very gravelly loamy sand

Properties and qualities

Slope: 0 to 3 percent
Depth to restrictive feature: More than 80 inches
Natural drainage class: Well drained
Runoff class: Very low
Capacity of the most limiting layer to transmit water (Ksat): High to very high (5.95 to 19.98 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Available water storage in profile: Very low (about 2.5 inches)

Interpretive groups

Land capability classification (irrigated): 4e
Land capability classification (nonirrigated): 6e
Hydrologic Soil Group: A
Ecological site: Gravelly Foothill (R049BY214CO)
Hydric soil rating: No

Minor Components

Fluvaquentic haplaquolls

Percent of map unit:
Landform: Swales
Hydric soil rating: Yes

Other soils

Percent of map unit:

Hydric soil rating: No

Pleasant

Percent of map unit:

Landform: Depressions

Hydric soil rating: Yes

83—Stapleton sandy loam, 3 to 8 percent slopes

Map Unit Setting

National map unit symbol: 369z

Elevation: 6,500 to 7,300 feet

Mean annual precipitation: 14 to 16 inches

Mean annual air temperature: 46 to 48 degrees F

Frost-free period: 125 to 145 days

Farmland classification: Not prime farmland

Map Unit Composition

Stapleton and similar soils: 80 percent

Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Stapleton

Setting

Landform: Hills

Landform position (three-dimensional): Side slope

Down-slope shape: Linear

Across-slope shape: Linear

Parent material: Sandy alluvium derived from arkose

Typical profile

A - 0 to 11 inches: sandy loam

Bw - 11 to 17 inches: gravelly sandy loam

C - 17 to 60 inches: gravelly loamy sand

Properties and qualities

Slope: 3 to 8 percent

Depth to restrictive feature: More than 80 inches

Natural drainage class: Well drained

Runoff class: Low

Capacity of the most limiting layer to transmit water (Ksat): High (2.00 to 6.00 in/hr)

Depth to water table: More than 80 inches

Frequency of flooding: None

Frequency of ponding: None

Available water storage in profile: Low (about 4.7 inches)

Interpretive groups

Land capability classification (irrigated): None specified

Land capability classification (nonirrigated): 3e

Hydrologic Soil Group: B
