PCD File No. TBD

Engineer's Statement

The attached drainage plan and report were prepared under my direction and supervision and are correct to the best of my knowledge and belief. Said drainage report has been prepared according to the criteria established by the County for drainage reports and said report is in conformity with the applicable master plan of the drainage basin. I accept responsibility for any liability caused by any negligent acts, errors or omissions on my part in preparing this report.

Colleen Monahan, PE Date

State of Colorado No.

For and on behalf of HR Green Development, LLC

Owner/Developer's Statement

I, the owner/developer have read and will comply with all of the requirements specified in this drainage report and plan.

I. General Purpose, Location and Description

a. Purpose

The purpose of this Preliminary Drainage Report (PDR) for 4-Way Commercial is to describe onsite and offsite drainage patterns, size drainage and temporary erosion control measures to safely capture and convey stormwater runoff to temporary sediment basins during the initial phase of grading of designated areas of the site, size preliminary stormwater infrastructure and permanent control measures, and to safely route treated stormwater to adequate outfalls.

b. Location

The site lies within a part of the Southwest Quarter of Section 28 and the Northwest Quarter of Section 33, Township 12 South, Range 64 West of the 6th P.M., El Paso County, Colorado. The site is bound to the north by undeveloped unplatted land, to the east by State Highway 24 and land zoned A-35, to the west by 2.5-acre single-family properties that are part of 4-Way Ranch Filing No. 1, and to the south by land zoned A-35. A vicinity map is presented in Appendix A.

The overall 4-Way 67.1-acre property contains two tracts that are bisected by Stapleton Drive, with approximately 15.5 acres located north of Stapleton Drive and 51.6 acres south of Stapleton Drive. All of the property to the north (15.5 acres) and approximately 16.5 acres of the southern property will be portioned off for Overlot grading, with the southernmost part of the southern tract being developed with 2 warehouses, storage containers, and parking for trailer (approximately 32 acres total). The proposed improvements shown in the preliminary drainage plan (approximately 16.5 acres disturbed area) are on the southern area of the property, are referred to as 'the site' herein. The remaining area of the property will remain undeveloped.

c. Description of Property

The site that is being portioned off for Overlot grading contains 32 acres within two tracts that are bisected by Stapleton Drive. Both are currently undeveloped and unplatted with Commercial zoning. Stapleton Drive has its own storm sewer and stormwater detention ponds that are located on the overall 4-way property. One detention pond is located partially within 'the site' in the southwest corner of Stapleton Drive and Highway 24. Part of the site also drains into this detention pond.

All of the property to the north (15.5 acres) and about 16.5 acres of the southern property will be portioned off for Overlot grading with the southernmost part of the southern tract being developed with 2 warehouses, storage containers, and parking for trailer (approximately 32 acres total) and are included in this project, referred to as 'the site' herein. The remaining 35.6 acres of the south tract will remain undeveloped. A total of 32 acres are expected to be disturbed during the Overlot grading phase, and 8 acres for the commercial development on the property.

The site lies within the Geick Ranch drainage basin and is tributary to Black Squirrel Creek. An unnamed tributary runs north-south through the southern tract and forms the west boundary of 'the site'. The portion of the site located east of this tributary drains southerly and easterly partially into this tributary, partially into a detention pond that provides treatment for Stapleton Drive, and partially into a swale that runs along the west side of Highway 24. The flows combine just south of the site where they flow easterly under Highway 24.

A second unnamed tributary traverses the northern boundary of the northern tract, and all initial grading will occur south of this tributary. Stormwater in this tract generally drains from west to east into the tributary or into the easterly adjacent property zoned A-35.

There is existing stormwater infrastructure on the site from Stapleton Drive storm sewer. There are existing culverts for stormwater crossings under an existing dirt road that leads to an existing 1-story wood frame building and water well site that is located on the remaining undeveloped part of the 4-Way property. There is an existing overhead electric line that crosses the southern part of the property.

Existing vegetation and soils were determined from in-person field site visits and existing aerial inspection from Google Earth and the United States Department of Agriculture Natural Resources Conservation Service (NRCS) Web Soil Survey. The site currently contains vegetation consisting primarily of native grasses and weeds. Existing vegetation is estimated at 25% density by visual inspection during the in-person field site visit.

Per a NRCS web soil survey, the site's soil is comprised of Type A soils: Blakeland loamy sand and Columbine gravelly sandy loam, Type B soil Stapleton sandy loam. A NRCS soil survey is presented in Appendix A.

Existing topography within the site ranges from about 3% up to 10%.

d. Floodplain Statement

The westerly portion of the overall 4-Way property lies within a designated FEMA floodplain as determined by the flood insurance map panel '08041C0552G' effective date December 7, 2018. This part of the overall 4-Way property will remain undeveloped. The remainder of the overall 4-Way property including 'the site' for overlot grading is located outside of the floodplain, in Zone X, as shown on flood insurance map panels '08041C0552G' '08041C0556G' and '08041C0558G' effective date December 7, 2018. Zone X are areas determined to be outside the 0.2% annual chance flood. The Refer to Appendix A for Firmette.

II. Drainage Design Criteria

a. Drainage Criteria

Hydrologic data and calculations were performed using the El Paso County Drainage Criteria Manual Volume 1 & 2 (EPCDCM), with current revisions.

Onsite drainage improvements are designed for the 5-year storm (minor event) and 100-year storm (major event) using rainfall values from the NOAA Atlas 14 Point Precipitation Frequency Data Server. Runoff was calculated per CCSDCM Section 6.3.0 - Rational Method. Full spectrum pond design is to be completed in a future Final Drainage Report (FDR) for the fully developed proposed conditions using the latest version of Mile High Flood District's (MHFD) UD-Detention per CCSDCM Section 13.3.2.1. The detention pond allowable release rate will be limited to less than historic rates. Proposed private storm sewer calculations will be provided with the FDR and will be calculated in accordance with County criteria.

Rainfall Depths per NOAA Atlas 14		
Return Period (yr)	5	100
1-hr Rainfall Depth (in)	1.22	2.51

III. Drainage Basins and Subbasins

a. Previous Drainage Studies

The site lies within the Geick Ranch drainage basin and is tributary to Black Squirrel Creek. The site's drainage characteristics were previously studied in the following reports:

1. "Final Drainage Report for 4 Way Ranch- Filing No. 1" prepared by JR Engineering, revised March 2006.
2. "Master Development Drainage Plan for 4-Way Ranch Phase 1" prepared by Associated Design Professionals, Inc, January 2012.
3. "MDDP Amendment/Preliminary Drainage Report for 4-Way Ranch Commercial" prepared by JR Engineering, revised February 2010.
4. "MDDP Amendment/Preliminary/Final Drainage Report for Stapleton Drive from Bandanero Drive to US Hwy 24" prepared by JR Engineering, revised May 2010.
6. Geick Ranch Drainage Basin Planning Study (DBPS), 2008.

b. Major Basin Description

Geick Ranch Drainage Basin is a 22.05 square mile watershed located in El Paso County, Colorado. Geick Ranch Drainage Basin begins approximately five miles northeast of the Town of Falcon and travels approximately 15 miles to the southeast. It is tributary to Black Squirrel Creek which drains to the Arkansas River near the city of Pueblo, Colorado. The majority of the basin is undeveloped and is rolling range land typical of Colorado's semi-arid climates. Anticipated land use for the basin includes residential, industrial, agricultural, and commercial development.

c. Existing Subbasin Description

The existing conditions hydrology is shown on an Existing Conditions Drainage Map within Appendix D. The map and supporting calculations quantify the stormwater runoff per historical conditions prior to overlot grading permit disturbance. The existing conditions were analyzed in the MDDP Amendment/Preliminary/Final Drainage Report for Stapleton Drive from Bandanero Drive to US Hwy 24 prepared by JR Engineering, revised May 2010. This report described the improvements for the construction of Stapleton Drive which has since been completed.

South Tract:

Runoff within the south tract flows generally from a northwest to southeast direction where flows will eventually combine and pass underneath Highway 24 at one of its existing major crossings. As stated in the approved MDDP referenced above, these crossings are adequately sized for the existing Stapleton Drive and drainage improvements that were put in place as part of that construction. With future on-site drainage improvements releasing at or below the 100-year historic flow rate, these crossings will remain satisfactory.

Basin D is 16.83 acres of undeveloped area on-site. This basin generally drains from the northwest to the southeast via sheet flow to (2) existing public 26" CMP culverts under US HWY 24 at DP1 (DBPS 4 per the MDDP Amendment/Preliminary/Final Drainage Report for Stapleton Drive from Bandanero Drive to US Hwy

24). The calculated stormwater runoff generated from this basin is $Q_5 = 4.3$ cfs $Q_{100} = 31.3$ cfs in the minor and major storms. The calculated runoff flows in this report are higher than those in the “MDDP Amendment/Preliminary/Final Drainage Report for Stapleton Drive from Bandanero Drive to US Hwy 24’ prepared by JR Engineering, revised May 2010” due to higher curve numbers for lawn areas specified in current criteria.

Basin E is 9.64 acres of undeveloped area on-site. This basin generally drains from the north to the south via sheet flow to (2) existing public 26” CMP culverts under US HWY 24 at DP1 (DBPS 4 per the MDDP Amendment/Preliminary/Final Drainage Report for Stapleton Drive from Bandanero Drive to US Hwy 24). The calculated stormwater runoff generated from this basin is $Q_5 = 2.5$ cfs $Q_{100} = 18.2$ cfs in the minor and major storms. The calculated runoff flows in this report are higher than those in the “MDDP Amendment/Preliminary/Final Drainage Report for Stapleton Drive from Bandanero Drive to US Hwy 24’ prepared by JR Engineering, revised May 2010” due to higher curve numbers for lawn areas specified in current criteria.

Basin F is 5.83 acres of undeveloped area on-site. This basin generally drains from the northwest to the southeast via sheet flow to an existing temporary sediment and detention basin on the northwest side of US HWY 24. The calculated stormwater runoff generated from this basin is $Q_5 = 2.6$ cfs $Q_{100} = 13.5$ cfs in the minor and major storms. The calculated runoff flows in this report are higher than those in the “MDDP Amendment/Preliminary/Final Drainage Report for Stapleton Drive from Bandanero Drive to US Hwy 24’ prepared by JR Engineering, revised May 2010” due to higher curve numbers for lawn areas specified in current criteria

North Tract:

Runoff within the north tract generally flows from west to east to the unnamed tributary bordering the north of this tract or into the adjacent lot to the east.

Basin NT1 is 1.45 acres of undeveloped area on the north edge of the north tract. This basin generally drains from the southwest to the northeast via sheet flow to an unnamed drainage channel on the north edge of the site. The unnamed channel drains to a public box culvert under US HWY 24 at DP2 (DBPS 5 per the MDDP Amendment/Preliminary/Final Drainage Report for Stapleton Drive from Bandanero Drive to US Hwy 24). The calculated stormwater runoff generated from this basin is $Q_5 = 0.5$ cfs $Q_{100} = 3.4$ cfs in the minor and major storms.

Basin NT2 is 10.65 acres of undeveloped area on the north tract. This basin generally drains from the west to the east via sheet flow/channelized flow to the east edge of the north tract area. Ultimately draining to the public box culvert under US HWY 24 at DP2 (DBPS 5 per the MDDP Amendment/Preliminary/Final Drainage Report for Stapleton Drive from Bandanero Drive to US Hwy 24). The calculated stormwater runoff generated from this basin is $Q_5 = 2.8$ cfs $Q_{100} = 20.8$ cfs in the minor and major storms.

Basin NT3 is 0.87 acres of undeveloped area on the south edge of the north tract. This basin generally drains from the northwest to the southeast via sheet flow onto the north side of Stapleton Drive. Ultimately draining to a public curb inlet near the intersection of Stapleton Dr and US HWY 24. Surface runoff captured by the public curb inlet drains through a series of public 24” RCP storm sewer pipes into an existing temporary sediment and detention basin on the northwest side of US HWY 24. The calculated stormwater runoff generated from this basin is $Q_5 = 0.3$ cfs $Q_{100} = 2.3$ cfs in the minor and major storms.

d. Final Grading Conditions

The final grading conditions hydrology is shown on the Final Drainage Map within the Appendix. The map and supporting calculations quantify the stormwater runoff per final grading conditions which includes disturbance of particular areas of the site for paved roadway corridors, paved parking areas, the construction of two warehouses, a future commercial development area, and full spectrum detention pond.

During final grading operations, runoff from the developed area of the site will be captured in sump inlets and conveyed into full spectrum detention Pond B. Runoff in the northern tract will remain as proposed in the overlot grading conditions and drain to a temporary sediment basin. The remaining area of the southern tract will remain undisturbed and will flow offsite based on historic drainage patterns.

North Tract

Basin TSA is the northern portion of the site that is 11.46 acres in total with 11.46 acres disturbed as a part of overlot grading. This basin drains generally from the northeast to the southwest to Temporary Sediment Basin A (TSB A) at DP4. TSB A is designed to treat a tributary area of 11.46 acres with a disturbed area of 11.46 acres. The required volume of TSB A is 0.47 ac-ft below the spillway crest elevation. TSB A exceeds this with a provided volume of 1.27 ac-ft. TSB A is designed to drain its entire volume within 40 hours via a temporary outlet structure. This temporary outlet structure was designed as a singular column with five 1" dia holes allowing for water to drain. Outflows from TSB 1 will be restricted to 20.7 cfs in order to limit flows to its ultimate design point (DP2) at or less than historic values. Sediment basin design is per Table SB-1 SWENT Drawing No. 900-TSB-2. The sediment basin is owned and maintained by the Owner/Developer and is to remain in place until interim and final phases construct permanent full spectrum detention Pond A. The calculated stormwater runoff generated from this basin is $Q_5 = 3.1$ cfs $Q_{100} = 13.5$ cfs in the minor and major storms.

Basin PNT1 is 0.13 acres of undeveloped area on-site and a small disturbed area from the proposed overlot grading improvements in the north tract. This subbasin represents the existing subbasin "NT1" under the proposed overlot grading conditions. There is no additional proposed impervious area proposed in this basin at the time of this report. This basin will maintain existing drainage patterns, while reducing the total peak flow drainage from existing conditions to its outfall location. This basin generally drains from the southwest to the northeast via sheet flow to an unnamed drainage channel on the north edge of the site. The unnamed channel drains to a public box culvert under US HWY 24 at DP2 (DBPS 5 per the MDDP Amendment/Preliminary/Final Drainage Report for Stapleton Drive from Bandanero Drive to US Hwy 24). The calculated stormwater runoff generated from this basin is $Q_5 = 0.04$ cfs $Q_{100} = 0.3$ cfs in the minor and major storms.

Basin PNT2 is 0.87 acres of undeveloped area on-site and a small disturbed area from the proposed overlot grading improvements in the north tract. This subbasin represents the existing subbasin "NT2" under the proposed overlot grading conditions. There is no additional proposed impervious area proposed in this basin at the time of this report. This basin will maintain existing drainage patterns, while reducing the total peak flow drainage from existing conditions to its outfall location. This basin generally drains from the west to the east via sheet flow/channelized flow to the east edge of the north tract area. Ultimately draining to the public box culvert under US HWY 24 at DP2 (DBPS 5 per the MDDP Amendment/Preliminary/Final Drainage Report for Stapleton Drive from Bandanero Drive to US Hwy 24). The calculated stormwater runoff generated from this basin is $Q_5 = 0.2$ cfs $Q_{100} = 1.7$ cfs in the minor and major storms.

Basin PNT3 is 0.56 acres of undeveloped area on-site and a small disturbed area from the proposed overlot grading improvements in the north tract. This subbasin represents the existing subbasin "NT3" under the

proposed overlot grading conditions. There is no additional proposed impervious area proposed in this basin at the time of this report. This basin will maintain existing drainage patterns, while reducing the total peak flow drainage from existing conditions to its outfall location. This basin generally drains from the northwest to the southeast via sheet flow onto the north side of Stapleton Drive. Ultimately draining to a public curb inlet near the intersection of Stapleton Dr and US HWY 24. Surface runoff captured by the public curb inlet drains through a series of public 24" RCP storm sewer pipes into an existing temporary sediment and detention basin on the northwest side of US HWY 24. The calculated stormwater runoff generated from this basin is $Q_5 = 0.2$ cfs $Q_{100} = 1.4$ cfs in the minor and major storms.

South Tract

Basin P1.1 is 0.78 acres of paved roadway. Stormwater ($Q_5 = 3.1$ cfs $Q_{100} = 5.6$ cfs) is captured at DP3.1 in a private 3' Type C sump inlet and is conveyed through a private 15" HDPE to DP3.2

Basin P1.2 is 0.26 acres of paved roadway. Stormwater ($Q_5 = 1.1$ cfs $Q_{100} = 2.0$ cfs) is captured at DP3.2 in a private 5' Type R sump inlet and is conveyed through a private 18" HDPE to DP3.3

Basin P1.3 is 0.4 acres of paved area and 0.19 acres of lawn area. Stormwater ($Q_5 = 1.9$ cfs $Q_{100} = 3.9$ cfs) is captured at DP3.3 in a private 5' Type R sump inlet and is conveyed through a private 18" HDPE to DP3.4

Basin P1.4 is 0.95 acres of paved area and 0.28 acres of roof area. Stormwater ($Q_5 = 5.5$ cfs $Q_{100} = 9.9$ cfs) is captured at DP3.4 in a private 5' Type R sump inlet and is conveyed through a private 24" HDPE to DP3.5

Basin P1.5 is 0.64 acres of paved area. Stormwater ($Q_5 = 3.0$ cfs $Q_{100} = 5.3$ cfs) is captured at DP3.1 in a private 5' Type R sump inlet and is conveyed through a private 24" HDPE to Pond B at DP3.12.

Basin P1.6A is 2.72 acres of undeveloped area. This area is designated to be a commercial site at a future date. Stormwater (Interim $Q_5 = 0.8$ cfs Interim $Q_{100} = 5.9$ cfs) is captured in a private stormsewer system to be connected to a private 30" HDPE stub at the western edge of the future development area. Flows are then conveyed to DP3.6. The stormwater flows from this basin after the build out of the future commercial site would be $Q_5 = 10.2$ cfs and $Q_{100} = 17.1$ cfs.

Basin P1.6B is 0.45 acres of paved area and 0.28 acres of roof area. Stormwater ($Q_5 = 3.1$ cfs $Q_{100} = 5.7$ cfs) is captured at DP3.6 in a private 5' Type R sump inlet and is conveyed through a private 30" HDPE to DP3.8

Basin P1.7A is 1.72 acres of undeveloped area. This area is designated to be a commercial site at a future date. Stormwater (Interim $Q_5 = 0.5$ cfs Interim $Q_{100} = 3.9$ cfs) is captured in a private 24" HDPE to be connected to a future stormwater system. Flows are then conveyed to DP3.7. The stormwater flows from this basin after the build out of the future commercial site would be $Q_5 = 6.3$ cfs and $Q_{100} = 10.6$ cfs.

Basin P1.7B is 0.31 acres of paved area and 0.28 acres of roof area. Stormwater ($Q_5 = 3.1$ cfs $Q_{100} = 5.7$ cfs) is captured at DP3.6 in a private 5' Type R sump inlet and is conveyed through a private 24" HDPE to DP3.9

Basin P1.8 is 0.76 acres of paved area. Stormwater ($Q_5 = 3.2$ cfs $Q_{100} = 5.7$ cfs) is captured at DP3.10 in a private 5' Type R sump inlet and is conveyed through a private 18" HDPE to DP3.11

Basin P1.9 is 0.20 acres of paved area. Stormwater ($Q_5 = 0.9$ cfs $Q_{100} = 1.7$ cfs) is captured at DP3.8 in a private a Duraslott XL trench drain and is conveyed to DP3.9

Basin P1.10 is 0.85 acres of paved area, 1.28 acres of lawn area, and 0.28 acres of roof area. Stormwater ($Q_5 = 5.5$ cfs $Q_{100} = 12.8$ cfs) is conveyed through sheet flow to Pond B at DP3.12

Basin PD is 14.99 acres of undeveloped area on-site and a small disturbed area from the proposed overlot grading improvements. Basin PD will not be disturbed past overlot grading conditions and will follow historic drainage patterns.

Basin PE is 2.56 acres of undeveloped area on-site and a small disturbed area from the proposed overlot grading improvements. Basin PE will not be disturbed past overlot grading conditions and will follow historic drainage patterns.

Basin PF is 2.73 acres of undeveloped area on-site and a small disturbed area from the proposed overlot grading improvements. Basin PF will not be disturbed past overlot grading conditions and will follow historic drainage patterns.

See Table 1 below for proposed TSB parameters.

Table 1: TSB Summary

Tributary Sub-Basin	Sediment Basin Name	Tributary Acres	Required Detention Volume below spillway crest (ac-ft)	Provided Volume up to spillway crest (ac-ft)	Total Provided Volume (ac-ft)
TSA	TSB A	11.46	0.47	0.95	1.27
TSB	TSB B	12.48	0.52	3.58	5.22

See Table 2 below for proposed full spectrum detention pond parameters.

Table 2: Pond Summary

Tributary Sub-Basin	Pond Name	Tributary Acres	Required Detention Volume (ac-ft)	Provided Volume (ac-ft)	Release Rate (cfs)
Basins P1.1-1.11	Pond B	12.45	1.969	4.652	6

IV. Drainage Facility Design

a. General Concept

The drainage facilities for the overlot grading conditions will consist of the Temporary Sediment Basins (TSBs) only. The designed TSBs will be constructed in the area of future permanent detention ponds A and B which will be constructed at time of development of the commercial properties. The temporary sediment basins will not include construction of the inflow forebay, concrete trickle channel, the lower maintenance paths at the bottom of pond, and outlet structures with outlet pipes. Stormwater flows will be allowed to overtop the edge of the TSBs and flow through interim swales to historic drainage ways. Water volume in the pond will also infiltrate into the soil. The described natural release structure for each TSB will meet the minimum 40-hour drain/release time of storm water runoff from the property. Once the project progresses past this overlot grading phase, both TSB A and TSB B will be converted to full spectrum detention ponds. The final pond improvement for Pond B has been designed and will be constructed with the initial phase of

development described in this report. Further design details and improvements will be described in the FRD. Pond A will be designed at a later phase of development.

b. Water Quality & Detention

Water Quality is to be provided via future ponds A and B as a part of the interim and final phases of construction. As explained in earlier sections, Temporary Sediment Basins located at the future detention pond locations and constructed with similar basin geometry are to be implemented at the Overlot grading stage.

Water quality and full spectrum detention has been provided in Pond B.

c. Inspection and Maintenance

The private full spectrum detention ponds are to be owned and maintained by a metropolitan district, to be established with the project. Maintenance access for the full spectrum detention facilities will be provided through private drainage easements and tracts. The TSB's in Tracts A and B for the overlot grading phase are owned and maintained by the Owner or its assigns until the time of the full spectrum detention ponds.

V. Four Step Method to Minimize Adverse Impacts of Urbanization

Step 1 – Reducing Runoff Volumes: Low impact development (LID) practices are utilized to reduce runoff at the source. In general, stormwater discharges are routed across pervious areas prior to capture in diversion ditches constructed at the Overlot grading stage. This practice promotes infiltration and reduces peak runoff rates. LID practices will also be utilized in future phases of development through the use of grass swales, and buffers.

Step 2 – Treat and slowly release the WQCV: This step utilizes full spectrum water quality and detention to capture the WQCV and slowly release runoff from the site. Onsite full spectrum detention ponds provide water quality treatment for the site. The WQCV is released over a period of 40 hours. Proposed and future ponds will provide full spectrum detention for improvements.

Step 3 – Stabilize stream channels: This step establishes practices to stabilize drainageways and provide scour protection at stormwater outfalls. There are no major drainageways affected by the Overlot grading of the commercial development phase of the development. No improvements to any downstream drainageways are required or anticipated at this time. Diversion ditches and swales are utilized to convey stormwater and sediment runoff to the temporary sediment basins. These are considered stabilized control measures.

Step 4 – Consider the need for source controls: Source controls are provided for the proposed initial development phase and the commercial development phase and are discussed in the Stormwater Management Report for this project.

VI. Opinion of Probable Cost

An engineer's opinion of probable cost is presented will be provided with a Final Drainage Report at time of development.

VII. Erosion Control Plan

The El Paso County Drainage Criteria Manual specifies an Erosion Control Plan and associated cost estimate must be submitted since this project is disturbing more than 1 acre. The Erosion Control Plan for 4-Way Commercial and for the initial phase of development have been submitted concurrently with this report.

VIII. Drainage and Bridge Fees

Drainage and Bridge Fees are not due with the preliminary drainage report. An estimate of basin fees for the proposed development will be calculated and provided with the FDR.

IX. Summary

The Preliminary Drainage Report discusses the site conditions at the time of initial overlot disturbance which includes preliminary undercut earthwork of the roadway corridors as well as the implementation of diversion ditches and temporary sediment basins as control measures for erosion and sediment control prior to interim and final construction phases. This report also discusses the preliminary development for the site and additional detail will be provided in the FDR. The proposed improvements will not adversely affect the offsite major drainageways or surrounding development.

The basins will be owned and maintained by the Owner/Developer until such time that future construction of the permanent control measures will be owned and maintained by a Metropolitan District to be established with the project. All drainage facilities were sized per the El Paso County Drainage Criteria Manuals which include standards and details from the Mile High Flood District.

The pin displayed on the map is an approximate point selected by the user and does not represent an authoritative property location.

This map complies with FEMA's standards for the use of digital flood maps if it is not void as described below. The basemap shown complies with FEMA's basemap accuracy standards

The flood hazard information is derived directly from the authoritative NFHL web services provided by FEMA. This map was exported on **11/7/2022 at 6:05 PM** and does not reflect changes or amendments subsequent to this date and time. The NFHL and effective information may change or become superseded by new data over time.

This map image is void if the one or more of the following map elements do not appear: basemap imagery, flood zone labels, legend, scale bar, map creation date, community identifiers, FIRM panel number, and FIRM effective date. Map images for unmapped and unmodernized areas cannot be used for regulatory purposes.

Hydrologic Soil Group—El Paso County Area, Colorado

Soil Map may not be valid at this scale.

Map Scale: 1:7,460 if printed on A landscape (11" x 8.5") sheet.

Map projection: Web Mercator Corner coordinates: WGS84 Edge tics: UTM Zone 13N WGS84

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
 Web Soil Survey URL:
 Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: El Paso County Area, Colorado
 Survey Area Data: Version 20, Sep 2, 2022

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Sep 11, 2018—Oct 20, 2018

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Hydrologic Soil Group

Map unit symbol	Map unit name	Rating	Acres in AOI	Percent of AOI
8	Blakeland loamy sand, 1 to 9 percent slopes	A	3.8	1.4%
19	Columbine gravelly sandy loam, 0 to 3 percent slopes	A	212.8	77.0%
83	Stapleton sandy loam, 3 to 8 percent slopes	B	59.8	21.6%
Totals for Area of Interest			276.4	100.0%

Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

¹ Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS). Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values. Please refer to NOAA Atlas 14 document for more information.

FORMULAS:

$$t_i = \frac{0.395(1.1 - C_s)\sqrt{L}}{S^{0.33}}$$

$$V = C_v S_w^{0.5}$$

Table 6-7. Conveyance Coefficient, C_v

Type of Land Surface	C _v
Heavy meadow	2.5
Tillage/field	5
Riprap (not buried)*	6.5
Short pasture and lawns	7
Nearly bare ground	10
Grassed waterway	15
Paved areas and shallow paved swales	20

*For buried riprap, select C_v value based on type of vegetative cover.

APPENDIX D – WQ & DETENTION

DETENTION BASIN OUTLET STRUCTURE DESIGN

MHFD-*Detention, Version 4.06 (July 2022)*

Project: 4-Way Commercial

Basin ID: Southern Parcel (Interim Condition - Pre development of future commercial area tributary to pond)

	Estimated Stage (ft)	Estimated Volume (ac-ft)	Outlet Type
Zone 1 (WQCV)	1.29	0.214	Orifice Plate
Zone 2 (EURV)	2.17	0.504	Circular Orifice
Zone 3 (100-year)	2.74	0.423	Weir&Pipe (Restrict)
Total (all zones)		1.141	

User Input: Orifice at Underdrain Outlet (typically used to drain WQCV in a Filtration BMP)

Underdrain Orifice Invert Depth =	N/A	ft (distance below the filtration media surface)
Underdrain Orifice Diameter =	N/A	inches

Calculated Parameters for Underdrain

Underdrain Orifice Area =	N/A	ft ²
Underdrain Orifice Centroid =	N/A	feet

User Input: Orifice Plate with one or more orifices or Elliptical Slot Weir (typically used to drain WQCV and/or EURV in a sedimentation BMP)

Centroid of Lowest Orifice =	0.00	ft (relative to basin bottom at Stage = 0 ft)
Depth at top of Zone using Orifice Plate =	2.17	ft (relative to basin bottom at Stage = 0 ft)
Orifice Plate: Orifice Vertical Spacing =	N/A	inches
Orifice Plate: Orifice Area per Row =	N/A	sq. inches

Calculated Parameters for Plate

WQ Orifice Area per Row =	N/A	ft ²
Elliptical Half-Width =	N/A	feet
Elliptical Slot Centroid =	N/A	feet
Elliptical Slot Area =	N/A	ft ²

User Input: Stage and Total Area of Each Orifice Row (numbered from lowest to highest)

	Row 1 (required)	Row 2 (optional)	Row 3 (optional)	Row 4 (optional)	Row 5 (optional)	Row 6 (optional)	Row 7 (optional)	Row 8 (optional)
Stage of Orifice Centroid (ft)	0.00	0.50	1.00					
Orifice Area (sq. inches)	1.45	1.45	1.45					

	Row 9 (optional)	Row 10 (optional)	Row 11 (optional)	Row 12 (optional)	Row 13 (optional)	Row 14 (optional)	Row 15 (optional)	Row 16 (optional)
Stage of Orifice Centroid (ft)								
Orifice Area (sq. inches)								

User Input: Vertical Orifice (Circular or Rectangular)

	Zone 2 Circular	Not Selected	
Invert of Vertical Orifice =	1.30	N/A	ft (relative to basin bottom at Stage = 0 ft)
Depth at top of Zone using Vertical Orifice =	2.17	N/A	ft (relative to basin bottom at Stage = 0 ft)
Vertical Orifice Diameter =	1.00	N/A	inches

Calculated Parameters for Vertical Orifice

	Zone 2 Circular	Not Selected	
Vertical Orifice Area =	0.01	N/A	ft ²
Vertical Orifice Centroid =	0.04	N/A	feet

User Input: Overflow Weir (Dropbox with Flat or Sloped Gate and Outlet Pipe OR Rectangular/Trapezoidal Weir and No Outlet Pipe)

	Zone 3 Weir	Not Selected	
Overflow Weir Front Edge Height, Ho =	3.07	N/A	ft (relative to basin bottom at Stage = 0 ft)
Overflow Weir Front Edge Length =	5.67	N/A	feet
Overflow Weir Gate Slope =	0.00	N/A	H:V
Horiz. Length of Weir Sides =	2.92	N/A	feet
Overflow Gate Type =	Type C Gate	N/A	
Debris Clogging % =	50%	N/A	%

Calculated Parameters for Overflow Weir

	Zone 3 Weir	Not Selected	
Height of Gate Upper Edge, H ₁ =	3.07	N/A	feet
Overflow Weir Slope Length =	2.92	N/A	feet
Gate Open Area / 100-yr Orifice Area =		N/A	
Overflow Gate Open Area w/o Debris =	11.52	N/A	ft ²
Overflow Gate Open Area w/ Debris =	5.76	N/A	ft ²

User Input: Outlet Pipe w/ Flow Restriction Plate (Circular Orifice, Restrictor Plate, or Rectangular Orifice)

	Zone 3 Restrictor	Not Selected	
Depth to Invert of Outlet Pipe =		N/A	ft (distance below basin bottom at Stage = 0 ft)
Outlet Pipe Diameter =		N/A	inches
Restrictor Plate Height Above Pipe Invert =			inches

Calculated Parameters for Outlet Pipe w/ Flow Restriction Plate

	Zone 3 Restrictor	Not Selected	
Outlet Orifice Area =		N/A	ft ²
Outlet Orifice Centroid =		N/A	feet
Half-Central Angle of Restrictor Plate on Pipe =		N/A	radians

User Input: Emergency Spillway (Rectangular or Trapezoidal)

Spillway Invert Stage =	4.00	ft (relative to basin bottom at Stage = 0 ft)
Spillway Crest Length =	33.00	feet
Spillway End Slopes =	4.00	H:V
Freeboard above Max Water Surface =	2.00	feet

Calculated Parameters for Spillway

Spillway Design Flow Depth =	0.50	feet
Stage at Top of Freeboard =	6.50	feet
Basin Area at Top of Freeboard =	1.08	acres
Basin Volume at Top of Freeboard =	4.65	acre-ft

Routed Hydrograph Results

The user can override the default CUHP hydrographs and runoff volumes by entering new values in the Inflow Hydrographs table (Columns W through AF).

	WQCV	EURV	2 Year	5 Year	10 Year	25 Year	50 Year	100 Year	500 Year
Design Storm Return Period =									
One-Hour Rainfall Depth (in) =	N/A	N/A	1.19	1.50	1.75	2.00	2.25	2.52	3.14
CUHP Runoff Volume (acre-ft) =	0.214	0.718	0.535	0.711	0.851	1.074	1.291	1.566	2.163
Inflow Hydrograph Volume (acre-ft) =	N/A	N/A	0.535	0.711	0.851	1.074	1.291	1.566	2.163
CUHP Predevelopment Peak Q (cfs) =	N/A	N/A	0.1	0.1	0.2	1.8	3.7	6.0	11.1
OPTIONAL Override Predevelopment Peak Q (cfs) =	N/A	N/A							
Predevelopment Unit Peak Flow, q (cfs/acre) =	N/A	N/A	0.01	0.01	0.02	0.15	0.30	0.49	0.89

DETENTION BASIN STAGE-STORAGE TABLE BUILDER

MHFD-Detention, Version 4.06 (July 2022)

DETENTION BASIN OUTLET STRUCTURE DESIGN

MHFD-*Detention, Version 4.06 (July 2022)*

Project: 4-Way Commercial
Basin ID: Southern Parcel

	Estimated Stage (ft)	Estimated Volume (ac-ft)	Outlet Type
Zone 1 (WQCV)	1.63	0.368	Orifice Plate
Zone 2 (EURV)	3.06	1.026	Circular Orifice
Zone 3 (100-year)	3.75	0.575	Weir&Pipe (Restrict)
Total (all zones)		1.969	

User Input: Orifice at Underdrain Outlet (typically used to drain WQCV in a Filtration BMP)

Underdrain Orifice Invert Depth =	N/A	ft (distance below the filtration media surface)
Underdrain Orifice Diameter =	N/A	inches

Calculated Parameters for Underdrain

Underdrain Orifice Area =	N/A	ft ²
Underdrain Orifice Centroid =	N/A	feet

User Input: Orifice Plate with one or more orifices or Elliptical Slot Weir (typically used to drain WQCV and/or EURV in a sedimentation BMP)

Centroid of Lowest Orifice =	0.00	ft (relative to basin bottom at Stage = 0 ft)
Depth at top of Zone using Orifice Plate =	1.63	ft (relative to basin bottom at Stage = 0 ft)
Orifice Plate: Orifice Vertical Spacing =	N/A	inches
Orifice Plate: Orifice Area per Row =	1.90	sq. inches (diameter = 1-9/16 inches)

Calculated Parameters for Plate

WQ Orifice Area per Row =	1.319E-02	ft ²
Elliptical Half-Width =	N/A	feet
Elliptical Slot Centroid =	N/A	feet
Elliptical Slot Area =	N/A	ft ²

User Input: Stage and Total Area of Each Orifice Row (numbered from lowest to highest)

	Row 1 (required)	Row 2 (optional)	Row 3 (optional)	Row 4 (optional)	Row 5 (optional)	Row 6 (optional)	Row 7 (optional)	Row 8 (optional)
Stage of Orifice Centroid (ft)	0.00	0.50	1.00					
Orifice Area (sq. inches)	1.90	1.90	1.90					

	Row 9 (optional)	Row 10 (optional)	Row 11 (optional)	Row 12 (optional)	Row 13 (optional)	Row 14 (optional)	Row 15 (optional)	Row 16 (optional)
Stage of Orifice Centroid (ft)								
Orifice Area (sq. inches)								

User Input: Vertical Orifice (Circular or Rectangular)

	Zone 2 Circular	Not Selected	
Invert of Vertical Orifice =	1.64	N/A	ft (relative to basin bottom at Stage = 0 ft)
Depth at top of Zone using Vertical Orifice =	3.06	N/A	ft (relative to basin bottom at Stage = 0 ft)
Vertical Orifice Diameter =	2.33	N/A	inches

Calculated Parameters for Vertical Orifice

	Zone 2 Circular	Not Selected	
Vertical Orifice Area =	0.03	N/A	ft ²
Vertical Orifice Centroid =	0.10	N/A	feet

User Input: Overflow Weir (Dropbox with Flat or Sloped Gate and Outlet Pipe OR Rectangular/Trapezoidal Weir and No Outlet Pipe)

	Zone 3 Weir	Not Selected	
Overflow Weir Front Edge Height, Ho =	3.07	N/A	ft (relative to basin bottom at Stage = 0 ft)
Overflow Weir Front Edge Length =	5.67	N/A	feet
Overflow Weir Gate Slope =	0.00	N/A	H:V
Horiz. Length of Weir Sides =	2.92	N/A	feet
Overflow Gate Type =	Type C Gate	N/A	
Debris Clogging % =	50%	N/A	%

Calculated Parameters for Overflow Weir

	Zone 3 Weir	Not Selected	
Height of Gate Upper Edge, H _t =	3.07	N/A	feet
Overflow Weir Slope Length =	2.92	N/A	feet
Gate Open Area / 100-yr Orifice Area =	17.14	N/A	
Overflow Gate Open Area w/o Debris =	11.52	N/A	ft ²
Overflow Gate Open Area w/ Debris =	5.76	N/A	ft ²

User Input: Outlet Pipe w/ Flow Restriction Plate (Circular Orifice, Restrictor Plate, or Rectangular Orifice)

	Zone 3 Restrictor	Not Selected	
Depth to Invert of Outlet Pipe =	0.25	N/A	ft (distance below basin bottom at Stage = 0 ft)
Outlet Pipe Diameter =	18.00	N/A	inches
Restrictor Plate Height Above Pipe Invert =	7.30	N/A	inches

Calculated Parameters for Outlet Pipe w/ Flow Restriction Plate

	Zone 3 Restrictor	Not Selected	
Outlet Orifice Area =	0.67	N/A	ft ²
Outlet Orifice Centroid =	0.35	N/A	feet
Half-Central Angle of Restrictor Plate on Pipe =	1.38	N/A	radians

User Input: Emergency Spillway (Rectangular or Trapezoidal)

Spillway Invert Stage =	4.00	ft (relative to basin bottom at Stage = 0 ft)
Spillway Crest Length =	33.00	feet
Spillway End Slopes =	4.00	H:V
Freeboard above Max Water Surface =	2.00	feet

Calculated Parameters for Spillway

Spillway Design Flow Depth =	0.50	feet
Stage at Top of Freeboard =	6.50	feet
Basin Area at Top of Freeboard =	1.08	acres
Basin Volume at Top of Freeboard =	4.65	acre-ft

Routed Hydrograph Results

The user can override the default CUHP hydrographs and runoff volumes by entering new values in the Inflow Hydrographs table (Columns W through AF).

	WQCV	EURV	2 Year	5 Year	10 Year	25 Year	50 Year	100 Year	500 Year
Design Storm Return Period =	N/A	N/A	1.19	1.50	1.75	2.00	2.25	2.52	3.14
One-Hour Rainfall Depth (in) =	N/A	N/A	1.19	1.50	1.75	2.00	2.25	2.52	3.14
CUHP Runoff Volume (acre-ft) =	0.368	1.394	0.989	1.279	1.512	1.776	2.035	2.331	2.990
Inflow Hydrograph Volume (acre-ft) =	N/A	N/A	0.989	1.279	1.512	1.776	2.035	2.331	2.990
CUHP Predevelopment Peak Q (cfs) =	N/A	N/A	0.1	0.1	0.2	1.8	3.7	6.0	11.1
OPTIONAL Override Predevelopment Peak Q (cfs) =	N/A	N/A							
Predevelopment Unit Peak Flow, q (cfs/acre) =	N/A	N/A	0.01	0.01	0.02	0.15	0.30	0.49	0.89
Peak Inflow Q (cfs) =	N/A	N/A	15.7	19.9	22.9	28.0	32.1	37.6	48.2
Peak Outflow Q (cfs) =	0.2	0.5	0.4	0.4	0.6	2.9	5.0	6.0	9.6
Ratio Peak Outflow to Predevelopment Q =	N/A	N/A	N/A	3.1	3.2	1.6	1.4	1.0	0.9
Structure Controlling Flow =	Plate	Vertical Orifice 1	Vertical Orifice 1	Vertical Orifice 1	Overflow Weir 1	Overflow Weir 1	Overflow Weir 1	Outlet Plate 1	Spillway
Max Velocity through Gate 1 (fps) =	N/A	N/A	N/A	N/A	0.0	0.2	0.4	0.5	0.5
Max Velocity through Gate 2 (fps) =	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A
Time to Drain 97% of Inflow Volume (hours) =	37	65	57	63	68	67	66	65	64
