DRAWING PREPARATION NOTE:

THE DRAWINGS COMPLETED IN THIS PACKAGE WERE PREPARED FROM VARIOUS SOURCES. IN SOME INSTANCES DISCREPANCIES MAY EXIST BETWEEN THE VARIOUS SOURCES, ESPECIALLY RELATED TO LOCATION OF EXISTING UTILITIES THAT MAY EXIST AND THE ACTUAL LOCATIONS WHERE UTILITIES NOT YET INSTALLED ARE PLACED.

PATRICK ENGINEERING COMPLETED A SURVEY OF THE PROJECT INCLUDING POT HOLING UTILITIES WHERE FOUND BY SURVEY AND SUE SOURCES.

THE FOLLOWING SOURCES WERE USED:

CSU PROVIDED DRAWING INFORMATION RELATED TO THE TIE–IN OF THE 16" GAS MAIN THAT THE 20" PIPELINE WILL CONNECT TO, AND THEIR RELOCATION OF THE LOW PRESSURE GAS MAIN ALONG THE EAST SIDE OF BLACK FOREST RD.

CSU PROVIDED DRAWINGS FOR THE PROPOSED PROJECT WORK ALONG VOLLMER RD. PREPARED BY JR ENGINEERING.

TERRA TECHNOLOGIES PROVIDED DRAWINGS RELATED TO REPLACEMENT OF CENTURYLINK'S FIBER AND TELEPHONE RELOCATIONS AT BLACK FOREST ROAD.

THE BLACK FOREST RD. ROAD IMPROVEMENT PROJECT WAS PREPARED AND PROVIDED BY AECOM.

THE WOLF RANCH DEVELOPMENT LANDSCAPE PLAN WAS PROVIDED BY THE DEVELOPER.

PATRICK ENGINEERING DOES NOT TAKE RESPONSIBILITY FOR THESE DESIGNS PROVIDED BY OTHERS. PATRICK ENGINEERING UTILIZED THEM AS THE BEST SOURCE OF INFORMATION TO DETERMINE THE ROUTE OF THE GAS MAIN.

CONTRACTOR SHALL VERIFY THE LOCATION OF ALL EXISTING UTILITIES, AND UTILITIES THAT ARE NOT INSTALLED YET, BUT ARE EXPECTED TO BE IN PLACE PRIOR TO THE CONSTRUCTION OF THE GAS MAIN.

IF THERE ARE ANY CONFLICTS FOUND THAT CANNOT BE ADJUSTED IN THE FIELD THAT REQUIRE AN ENGINEERING EVALUATION, CONTACT PATRICK ENGINEERING.

TRANSITION WELDS – CONNECTION METHOD NOTE:

IF WALL THICKNESS BETWEEN PIPE ENDS OR PIPE FITTING ENDS EXCEED 3/32" OR 0.09375". REQUEST FOR ENGINEERING APPROVAL OF A TRANSITION PIPE WHEN AVAILABLE TO ELIMINATE THE NEED FOR BACK WELDING AND TAPER BORES. WHEN BACK WELDING AND/OR TAPER BORE IS REQUIRED INDICATE LOCATION AND METHOD OF EACH CONNECTION MADE ON THE WELD DIAGRAM NEXT TO THE WELD NO.

GPS WELDS NOTE:

GPS ALL NEW WELDS AND EXISTING WELDS THAT ARE UNCOVERED IN THE TRENCH DURING CONSTRUCTION. ENSURE ALL WALL THICKNESS, AND OTHER PIPE INFORMATION AND WELD INFORMATION IS RECORDED.

LOCH FYNE 20" GAS PIPELINE
COLORADO SPRINGS, COLORADO
CONSTRUCTION NOTES
DWG. NO: **C-106**

TRAFFIC CONTROL FOR STREET CONSTRUCTION, UTILITY WORK AND MAINTENANCE OPERATIONS

CITY OF COLORADO SPRINGS

SPECIFIC REQUIREMENTS

Temporary Traffic Barrier:

The Contractor shall install Pre-cast Type 7F concrete, Type IV concrete, or Plastic Water Filled barrier between any lanes carrying public traffic and any excavation, obstacle, or storage area when the following conditions exist:

- When an excavation is 12 inches or greater in depth a minimum clear zone (CZ) in feet shall be required for the following design speeds:

30 MPH	35 MPH	40 MPH	45 MPH	50 MPH	55 MPH	60 MPH
12' CZ	14' CZ	16' CZ	20' CZ	22' CZ	24' CZ	30' CZ

- If the minimum Clear Zone cannot be maintained, then a temporary traffic barrier shall be required for work site protection.
- A temporary traffic barrier shall be supplemented with standard delineation (reflectors), pavement markings, or channelizing devices to provide nighttime visibility for vehicle traffic. The delineation or pavement marking color shall conform to the latest edition of the MUTCD.
- Temporary traffic barrier ends shall be installed in accordance with AASHTO's "Roadside Design Guide" by flaring until the end is outside the acceptable clear zone (clear zone is based on 85th percentile speed) or by providing crashworthy end treatments that meet or exceed MASH 350 Report.
- A temporary traffic barrier is required when the contractor has installed a permanent obstacle and the protective system, such as guardrail has not been installed or when a portion of an existing protective guardrail has been removed.
- A temporary traffic barrier is required when materials or equipment are stored within the clear zone of the work site.
- The use of a 12 ft. transition section is allowed at the downstream end of the installation pointing away from approaching traffic out of the clear zone, or at locations outside the clear zone, generally more than 30 ft. from the high speed travel lane edge.
- Glare Screens may be required, if used the blade height shall be 24".

Excavation and Trenches:

Excavations and/or trenches, which cannot be properly back-filled and patched prior to the end of the work day, shall be bridged to permit unobstructed traffic flow. Trench walls and adjacent soils shall be sufficiently stabilized prior to the use of steel plates for bridging.

Where traffic must cross trenches:

- The use of steel plates shall be approved by City Traffic Engineering prior to installation.
- The Colorado Springs Fire Department – Heavy Rescue Response Group shall be notified when the excavation or trench is 5 feet or greater in depth.
- Steel Trench Plate width and thickness requirements:

18" or less in width	Minimum thickness of ¾"
> 18" in width to 72" in width	Minimum thickness of 1"

- The thickness of Steel Plates for trench widths exceeding 72" a structural design shall be prepared by a Licensed Professional Engineer Registered in Colorado.
- Steel Plates can be installed in two ways. First, the Steel Plates can be installed flush with the existing pavement, milling out the pavement surface to ensure that the top of plate elevation matches the existing elevations of adjacent pavement surface. Second, the Steel Plates can be installed on top of the asphalt with transitional ramps (cold mix) on all four sides of the plates, with feathered edges to match the existing asphalt (8% or a lesser slope).
- The Steel Plates shall extend beyond the edge of the trench a minimum of 18" but no more than 30"on both sides.
- A non-skid surface treatment shall be applied to the entire surface area of the plate in the direction of traffic flow.
- The contractor should avoid using a long series of plates that run parallel to traffic wheel paths. If allowed, the length of a series of plates running parallel to traffic wheel paths shall not exceed 30'.
- The trench shall be adequately shored to support the steel plates and traffic loads.
- Steel Plates shall be installed to operate with minimum noise.
- All Steel Plates within the right-of-way, whether used in or out of the traveled way, shall be without deformation (free from any clips, chains, attachments, weldments, or surface irregularities).
- No one is allowed in the trench while covered by the Steel Plate.
- The use of Steel Plates shall not exceed four weeks and Rough Road or Bump signs shall be required during this period of time.

Arrow Boards:

Arrow Boards shall be furnished as required by project conditions and shall meet the following requirements:

Type	Minimum Size	Min. # of Panel Lamps	Min. Legibility Distance
A	48" x 24"	12	½ mile
B	60" x 30"	13	¾ mile
C	96" x 48"	15	1 mile

(Example: length of arrow equals 48"; width of arrowhead equals 24")

An arrow panel is a sign with a matrix of elements capable of flashing or showing sequential displays. This sign shall provide additional warning and directional information to assist in merging and channeling road users through or around a temporary traffic control zone. The panel face shall be rectangle in shape, solid construction and finished in non-reflective black. The arrow panel shall have the capability of the following mode selection: left arrow, right arrow, left and right arrow and caution. The caution mode consists of four or more flashing lamps arranged in a pattern which does not indicate a direction. Arrow panels shall include an automatic photocell sensor type signal lamp dimmer with manual override and shall be capable of a minimum of 50 percent dimming from rated lamp voltage.

Portable Variable Message Signs:

Variable Message Signs (VMS) are temporary traffic control devices with the flexibility to display a variety of messages. Each message shall consist of one or two phases. A phase consists of up to three lines of eight characters per line. Each character module shall use at least five wide and seven high pixel matrixes.

- VMS's shall be used on all major residential collector streets and higher classification of roadways, including roadway closures and detour routes. Also, VMS's shall be used when lane reductions can not handle the normal volume of traffic (no greater than 1,000 vehicles per lane per hour).
- VMS's shall be used to advise vehicular traffic of alternate routes and expected delays due to construction activity.
- VMS's shall be used to notify the general public of upcoming construction activities up to two weeks prior to start of construction.
- VMS's shall be solar powered or a non-internal combustion device.
- VMS's shall be equipped with a power source and a battery back-up to provide continuous operation when failure of the primary power source occurs.
- VMS's shall be capable of 360 degree rotation and elevated so the bottom of the sign is 5 feet above the ground.
- The sign shall be visible from one-half mile during both daytime and nighttime conditions.
- The message shall be legible from a minimum of 650 feet.
- The sign shall automatically adjust its light source to meet nighttime legibility requirements.

DETAIL NOTES

1. THE DETAILS ON THE NEXT FOUR SHEETS ARE FROM EL PASO COUNTY DEPARTMENT OF TRANSPORTATION "ENGINEERING CRITERIA MANUAL", THE CITY OF COLORADO SPRINGS "MANUAL ON UNIFORM TRAFFIC CONTROL DEVICES", AND OTHER ONLINE DETAIL DRAWINGS FROM THE CITY OF COLORADO SPRINGS PUBLIC WORKS DEPARTMENT.
2. ONLY THOSE DETAILS THAT APPEAR TO BE MOST APPLICABLE TO THIS PROJECT ARE ATTACHED. HOWEVER, THIS DOED NOT RELIEVE THE CONTRACTOR FROM OBTAINING THESE MANUALS FOR REVIEW FOR OTHER APPLICABLE STANDARDS.
3. THERE ARE TWO PAVED ROADS ON THIS PROJECT THAT ARE EXPECTED TO OPEN CUT. THEREFORE, THE DRAWINGS RELATED TO TRENCHING OPERATIONS UNDER THE ROADS, AND PAVEMENT REPAIR AND REPLACEMENT ARE PROVIDED. REFER TO DETAILS ON SHEET D-102. IF CONTROLLED LOW-STRENGTH MATERIAL (CLSM) IS APPROVED FOR TRENCH BACKFILL, REFER TO SHEET D-105.
4. IF WORK IN THE ROADWAY RIGHT-OF-WAY IS REQUIRED, CONTRACTOR SHALL CONSULT ADDITIONAL MAINTENANCE OF TRAFFIC (MOT) DRAWINGS ON SHEET D-101 WHERE REQUIRED FOR LANE CLOSURES, DETOURS AND TRAFFIC CONTROL DEVICES. IF ADDITIONAL MOT CONFIGURATIONS ARE REQUIRED, CONSULT THE EL PASO COUNTY DOT AND MANUAL UNIFORM TRAFFIC CONTROL DEVICES (MUTCD).
5. THE ENVIRONMENTAL DETAILS ON SHEETS D-103 AND D-104 WERE DETERMINED TO BE THE MOST APPLICABLE DRAWINGS FOR THIS PROJECT. IF THERE ARE CIRCUMSTANCES THAT ARE NOT COVERED BY THESE STANDARDS, THE CONTRACTOR SHALL WORK WITH CSU TO PROVIDE ADEQUATE BEST MANAGEMENT PRACTICES.

General Notes:

1. ALL WORK SHALL BE DONE IN ACCORDANCE WITH THE CURRENT CITY OF COLORADO SPRINGS ENGINEERING DIVISION (THE CITY) STANDARD SPECIFICATIONS.
2. THE CONTRACTOR SHALL OBTAIN ALL REQUIRED PERMITS. FOR CITY PERMITS CONTRACTORS SHALL USE THE ACCELA ON-LINE PERMIT SYSTEM. ONCE CITY PERMITS ARE APPROVED AND PAID, THEN APPROPRIATE SCHEDULING AND NOTIFICATIONS SHALL BE IN ACCELA.
3. PRIOR TO CUTTING INTO A ROADWAY, A MEETING IS REQUIRED WITH CITY INSPECTOR.
4. EXISTING PAVEMENT MAY BE INITIALLY ROUGH CUT. A SQUARE, VERTICAL CUT SHALL BE MADE IN THE EXISTING ASPHALT PAVEMENT PRIOR TO PAVEMENT PLACEMENT.
5. BACKFILL SHALL BE COMPACTED WITH SECTION 206 OF CITY STANDARD SPECIFICATIONS.
6. CLSM (FLOW-FILL) IS REQUIRED AS BACKFILL FOR TRENCHES LESS THAN 1-FOOT IN WIDTH. CLSM SHALL NOT EXTEND INTO PAVEMENT SECTION.
7. CLSM SHALL BE USED WHERE PAVEMENT SECTION IS LESS THAN 5-YEARS OLD.
8. HOT MIX ASPHALT (ASPHALT PAVING MATERIAL) SHALL MEET THE REQUIREMENTS OF THE PIKES PEAK ASPHALT SPECIFICATION AND BE APPROVED BY CITY ENGINEERING.
9. NEW ASPHALT SHALL NOT BE PLACED AGAINST FRESHLY POURED CONCRETE. CONCRETE SHALL BE 5-DAYS OLD OR HAVE REACHED A COMPRESSIVE STRENGTH OF 3,200 PSI AS DEMONSTRATED BY FIELD CURE CYLINDERS.
10. A TACK COAT SHALL BE APPLIED TO ALL VERTICAL EDGES INCLUDING CONCRETE EDGES. THE TACK COAT SHALL HAVE 100% COVERAGE AND BE APPLIED BETWEEN LIFTS.
11. A MINIMUM PAVEMENT SECTION OF:

    A) RESIDENTIAL/COLLECTOR...SHALL MATCH EXISTING OR A MINIMUM 6-INCHES OF CLASS 6 AGGREGATE BASE COURSE WITH 6-INCHES OF HOT-MIX ASPHALT (ASPHALT PAVING MATERIAL);

    B) ARTERIAL...12-INCHES OF CLASS 6 AGGREGATE BASE COURSE WITH 8-INCHES OF HOT-MIX ASPHALT (ASPHALT PAVING MATERIAL).

12. THE NEW PAVEMENT SECTION SHALL MATCH EXISTING PAVEMENT REPORT. FOR ROADWAYS WHERE THE SUBGRADE IS CHEMICALLY TREATED (CTS), CTS OR FLOW-FILL SHALL BE EQUIVALENT TO THE REQUIREMENT IN THE PAVEMENT DESIGN REPORT.
13. ALTERNATE REPAIR SECTIONS MAY BE APPROVED PROVIDED THEY ARE COMPLETED BY THE PAVEMENT DESIGN GEOTECHNICAL ENGINEER, AND APPROVED BY CITY ENGINEERING.
14. NEW HOT-MIXED ASPHALT (ASPHALT PAVING MATERIAL) SHALL BE FLUSH TO EXISTING ASPHALT AND CONCRETE EDGES AND SHALL NOT HAVE HUMPS OR VALLEYS.
15. WHERE CONCRETE PAVEMENT EXISTS BELOW THE ASPHALT, NEW CONCRETE SHALL BE PLACED TO MATCH THE EXISTING CONCRETE THICKNESS UNLESS OTHERWSE APPROVED BY CITY ENGINEERING.
16. IF A PLATE TAMPER IS USED FOR COMPACTION OF ASPHALT, THE MAXIMUM LOOSE LIFT THICKNESS SHALL BE 2-INCHES.
17. THESE DETAILS ARE FOR PAVEMENT CUTS LESS THAN 200-SF. CUTS GREATER THAN 200-SF SHALL BE IN CONFORMANCE WITH AN ENGINEERED DESIGN.
18. ANY DISTURBED PAVEMENT MARKINGS SHALL BE RESTORED TO CITY STANDARDS.

SEEDING & MULCHING

ALL SOIL TESTING, SOILS AMENDMENT AND FERTILIZER DOCUMENTATION, AND SEED LOAD AND BAG TICKETS MUST BE ADDED TO THE CSWMP.

SOIL PREPARATION

1. IN AREAS TO BE SEEDED, THE UPPER 6 INCHES OF THE SOIL MUST NOT BE HEAVILY COMPACTED, AND SHOULD BE IN FRIABLE CONDITION. LESS THAN 85% STANDARD PROCTOR DENSITY IS ACCEPTABLE. AREAS OF COMPACTION OR GENERAL CONSTRUCTION ACTIVITY MUST BE SCARIFIED TO A DEPTH OF 6 TO 12 INCHES PRIOR TO SPREADING TOPSOIL TO BREAK UP COMPACTED LAYERS AND PROVIDE A BLENDING ZONE BETWEEN DIFFERENT SOIL LAYERS.
2. AREAS TO BE PLANTED SHALL HAVE AT LEAST 4 INCHES OF TOPSOIL SUITABLE TO SUPPORT PLANT GROWTH.
3. THE CITY RECOMMENDS THAT EXISTING AND/OR IMPORTED TOPSOIL BE TESTED TO IDENTIFY SOIL DEFICIENCIES AND ANY SOIL AMENDMENTS NECESSARY TO ADDRESS THESE DEFICIENCIES. SOIL AMENDMENTS AND/OR FERTILIZERS SHOULD BE ADDED TO CORRECT TOPSOIL DEFICIENCIES BASED ON SOIL TESTING RESULTS.
4. TOPSOIL SHALL BE PROTECTED DURING THE CONSTRUCTION PERIOD TO RETAIN ITS STRUCTURE, AVOID COMPACTION, AND TO PREVENT EROSION AND CONTAMINATION. STRIPPED TOPSOIL MUST BE STORED IN AN AREA AWAY FROM MACHINERY AND CONSTRUCTION OPERATIONS, AND CARE MUST BE TAKEN TO PROTECT THE TOPSOIL AS A VALUABLE COMMODITY. TOPSOIL MUST NOT BE STRIPPED DURING UNDESIRABLE WORKING CONDITIONS (E.G. DURING WET WEATHER OR WHEN SOILS ARE SATURATED). TOPSOIL SHALL NOT BE STORED IN SWALES OR IN AREAS WITH POOR DRAINAGE.

SEEDING

1. ALLOWABLE SEED MIXES ARE INCLUDED IN THE CITY OF COLORADO SPRINGS STORMWATER CONSTRUCTION MANUAL. ALTERNATIVE SEED MIXES ARE ACCEPTABLE IF INCLUDED IN AN APPROVED LANDSCAPING PLAN.
2. SEED SHOULD BE DRILL-SEEDED WHENEVER POSSIBLE
   - SEED DEPTH MUST BE ¼ TO ½ INCHES WHEN DRILL-SEEDING IS USED.
3. BROADCAST SEEDING OR HYDRO-SEEDING WITH TACKIFIER MAY BE SUBSTITUTED ON SLOPES STEEPER THAN 3:1 OR ON OTHER AREAS NOT PRACTICAL TO DRILL SEED.

INTERIM RELEASE: CLSM (to the City Standard Specifications Manual)

206 Backfill of Utility Trenches using Controlled Low Strength Materials (CLSM)

UTILITY CUT, BACKFILL AND PATCHING

1 DESCRIPTION OF WORK

This work shall consist of the excavation and rapid backfill of trenches for the installation or repair of utility and underground features. The work also includes utilizing temporary pavement patching materials, and final permanent pavement surfaces. The work requires the use of removable, controlled low-strength materials (CLSM) for the backfill material, as an alternative to traditional compacted soil, for trenches and cuts too small for traditional soil compaction and safe human entry for testing. Various temporary pavement materials may also be utilized, prior to permanent pavement repairs. The use of traditional compacted backfill (for installation and repair of utilities) remains an acceptable method of backfill. The use of CLSM provides the advantage of being a self-compacting material.

1A Description of removable, flowable, controlled low strength materials CLSM

The term CLSM used in this Section shall mean the same as Removable CLSM or flowable backfill. This material is covered in detail due to the many time saving and engineering benefits of this type of backfill material. CLSM does not need compacting, or moisture density compaction testing. Only a few physical tests of the CLSM properties are needed to assure durability and future removability with light excavating equipment. A low strength is desired so that surrounding utilities or structures will be accessible without causing damage if the CLSM must be removed in the future. Air entrainment is required to prevent damage and heave displacement of trench patches due to freeze-thaw damage.

In addition, CLSM may be used for other applications apart from trench or street cut backfill. These include filling voids due to pipe abandonment or undercutting of excavation in caving or normal soils. CLSM offers quick restoration of the trench and improving other subgrade conditions for roadway or structure support in a rapid time frame without the need for traditional soil backfill testing requirements or when a quick strength is needed to support upper layers. These benefits may outweigh the extra costs vs. using traditional methods that require compaction and testing.

Other applications include: backfilling behind retaining walls and abutments, filling void areas including pipe abandonment, annular spaces, undercut areas and other approved void filling

applications. Other suitable applications include structural support for utilities and replacement of unstable subgrade during pavement repairs.

Utility types that can utilize CLSM include: conduits or pipes for electrical, wired or fiber optic communications, traffic signal or other utilities such as gas and water lines, sanitary and storm sewer lines, and other types of utilities under existing pavements or ground surfaces to be built upon or improved later.

1B Objectives for Required Use of CLSM

The objectives of requiring the use of the CLSM specified below, instead of reusing excavated soils, is to provide a self-leveling, frost heave-resistant, non-settling, controlled low-strength material (defined by American Concrete Institute in ACI 229 as a CLSM), that does not normally require compactive effort and compaction testing. Traditional use of compacted soil or aggregate materials for backfill shall require **CITY** approval and testing for acceptance.

1C Requirements for CLSM – Flow-Fill or Flashfill

This ITEM further specifies two distinct CLSM material products: The Flashfill products will allow trench backfill, temporary or permanent pavement restoration and traffic access to occur more quickly than Flow-Fill. The term 'CLSM' in this Section shall mean either or both.

A **high slump** is required to aid in the self-leveling and void filling objective. The visual consistency may appear to range in appearance from thin batter or mud, to thick water. It must be foremost removable with light machinery in the future, and also quickly stable to support paving operations and traffic.

Minimum air contents are required in the top 4 feet of CLSM fill to limit permanent frost heave. This air content requirement should be used for the entire depth, to aid in the ability to remove or excavate CLSM in the future. The air content requirement may be forbidden by some utility applications, such as for thrust blocks or for pipe bedding normally used for lateral support of pressurized pipes.

A **Removability Modulus** (RE) is specified at a maximum 1.5, and is based on compressive strength and unit weight of the CLSM Backfill. Refer to section 2C

2 CLSM MATERIALS

2A Flow-Fill

Flow-Fill shall consist of a controlled low-strength, self-leveling concrete material composed of various combinations of cement, fly ash, aggregates, water, chemical admixtures and/or cellular foam for air-entrainment. Generally, the **CONTRACTOR** may place Flow-Fill in approximate 3 feet thick layers, allow bleed water to rise and divert away from placement before another layer may be added. Refer to Section 3 for more information.

The Flow-Fill shall be limited to a maximum Removability Modulus (RE, as described in section 2C) of 1.5 to ensure ability to excavate in the future. Slumps of less than 7 inches will not be permitted for placement, since the flowability to fill voids and avoid future settlement is impaired, and strengths may increase beyond specified removability limits.

The **CONTRACTOR** shall submit a mix design for approval by the **CITY**, prior to placement. The mix design shall be supported by laboratory test data verifying compliance with air content, slump, strength and removability (RE) requirements.

TABLE 2A

Flow-Fill Property	Flow-Fill Specification

Compressive Strength, ASTM D4832	50psi – 150psi at 28 days
Slump, ASTM C143	7" – 10"
Removability Modulus, RE	1.5 Maximum

*All other requirements for Flow-Fill shall meet CDOT Section 206 for CLSM.

2B Flashfill

Flashfill shall consist of a controlled low-strength, self-leveling cementitious material composed of various combinations of fly ash, water, chemical admixtures and/or cellular foam for air-entrainment. No aggregate or sand is usually needed. It shall have a minimum specified air content to provide suitable resistance to frost-heave. Flashfill may generally be placed without lift thickness limits.

Higher strengths may be permitted over Flow-Fill; however, the Flashfill shall still be limited to a maximum Removability Modulus (RE) of 1.5. Slumps of less than 8 inches or spreads of less than 8 inches will not be permitted for placement, since the flowability to fill voids and avoid future settlement is impaired, and strengths may increase beyond removability limits.

The **CONTRACTOR** shall submit a mix design for approval by the **CITY**, prior to placement. The mix design shall be supported by laboratory test data verifying compliance with air content, slump, strength and removability (RE) requirements.

*All other requirements for Flashfill shall meet CDOT Section 206 for CLSM.

2C Removability Modulus

The Removability Modulus* ,RE , is a value calculated by

$$RE = \frac{W^{1.5} \times 104 \times C^{0.5}}{10^6}$$

where: W = in-situ unit weight (pcf) and C = 28-day compressive strength

*RE was developed & is used by Hamilton County, Ohio; per the NCHRP #597 CLSM Report. A lower RE means CLSM is easier to excavate or remove.

Some examples of RE based on strength and unit weights are shown below:

TABLE 2C

2D Air Content Volumetric Calculation

Air content can be calculated as follows (using wet unit weights before and after foaming or entraining air):

Air Content = (Unit Weight not Air-Entrained – Unit Weight Air-Entrained) x 100%
Unit Weight not Air-Entrained

2E Flow Consistency of CLSM

Flow shall be measured by ASTM D6103, which utilizes a moistened 3" diameter, 6" high open-ended cylinder, filled with the flashfill. When the cylinder is lifted, the resulting "pancake" is measured at its longest and shortest dimensions and averaged.

2G Fly Ash

Fly ash shall meet the requirements of ASTM C618 Type C or Type F. Fly ash not meeting the requirements of ASTM C618 may be used if prior testing indicates acceptable, consistent results for strength and air content.

2H Water

Potable water or reasonably clean and free of chemicals injurious to the final product are to be used.

2I Chemical Admixtures

Air-entraining admixtures shall conform to ASTM C260 requirements; other chemical admixtures shall conform to ASTM C494 requirements.

2J Foaming Agents

Foaming agents shall conform to ASTM C869 and C796, or as approved by the **CITY**.

2K Suitability of CLSM Constituents

The supplier shall have the required Beneficial Use Determination (BUD) from the CDPHE for the product they are supplying. Material Safety Data Sheets (MSDS) must be available for any cement, flyash or admixture component of the mixture upon request. Flowable Backfill shall be compatible with bedding materials, electrochemically and otherwise if used as a metal pipe backfill application. Thermal compatibility with plastic pipes should be considered for direct contact of the CLSM with the pipe; heat generation of the mix must not exceed the softening point of the pipe material.

2L CLSM Use Restrictions

CLSM products containing coal combustion residuals (CCR) (i.e. fly ash, bottom ash, boiler slag, and flue gas desulfurization materials generated from burning coal for the purpose of generating electricity by electric utilities and independent power producers) may not be placed below groundwater, or into permanent standing water, without the CONTRACTOR obtaining a

written waiver from the Colorado Department of Public Health & Environment's (CDPHE's) Hazardous Materials and Waste Management Division (HMWMD), and providing such waiver to the CITY for review / concurrence prior to placement.

The above noted use restriction with respect to groundwater and permanent standing water is not applicable if the CLSM product is being used in association with an emergency. An emergency is an occurrence involving a clear and imminent danger to human health or the environment, or similar occurrence demanding immediate attention, such as the restoration of a damaged utility, roadway, or storm water conveyance. If the emergency has subsided and sufficient time is available for planning (e.g., three weeks or more) the project is not considered an emergency with sole respect to CLSM placement.

Additionally, if a project involves the placement of CLSM on the land in non-roadway applications and the CLSM will contain 12,400 tons of CCR or more, the CONTRACTOR shall obtain written project specific approval from the CDPHE's HMWMD and provide such approval to the CITY for review / concurrence prior to placement. To obtain such approval, the CONTRACTOR shall adequately demonstrate that environmental releases to groundwater, surface water, soil and air are comparable to or lower than those from analogous products made without CCR, or that environmental releases to groundwater, surface water, soil and air will be at or below relevant regulatory and health-based benchmarks for human and ecological receptors during use.

2M Aggregates

The final blend of aggregates for CLSM, including rock, gravel or sand, shall conform to the following gradations:

TABLE 2L

Sieve Size	% Passing
1 inch (25 mm)	100
No. 200	0 to 10

When coarse aggregate is used, 100 percent shall pass the 1 inch sieve, and it shall comprise not more than 40 percent of the total aggregate content. Other aggregate products such as aggregate base, crushed rock, pea gravel, or reject sand which has no more than 20 percent passing the No. 200 sieve and is free of organic material and other deleterious substances, may

be accepted by the **CITY** if a flowable, workable mix can be produced without segregation of the aggregate.

3 TRENCH BACKFILL WITH CLSM

Except as otherwise provided or approved by the **CITY**, after the pipe or conduit is laid, trenches shall be backfilled with CLSM in the pipe zone as defined in the following table:

TABLE 3

Pipe or Conduit	Pipe Zone [1,2]
2-inch or less diameter	6 inches above the top of the pipe up to subgrade
Greater than 2-inch diameter, except vitrified clay pipe	12 inches above the top of the pipe up to subgrade
Vitrified clay pipe	24 inches above the top of the pipe up to subgrade

[1] The Utility Owner shall dictate any variance to these CLSM separation distances.
[2] Where depths of flashfill exceed 3 feet over water or wastewater mains please contact Colorado Springs Utilities for bedding depths.

CLSM should be well mixed and discharged directly from the truck into the space to be filled, or by other methods approved by the **CITY**. The mix may be placed part depth or full depth as conditions at the site and CLSM type dictate. When used as backfill in the pipe zone, care should be taken to prevent flotation or misalignment of the pipe by means of straps, soil anchors or other approved means of restraint. Material may be placed in stages with initially lesser flowability, to prevent movement or flotation of pipe. Refer to Section 2K for thermal compatibility when using CLSM directly against plastic pipe materials. CLSM shall not be placed when the trench bottom or walls are frozen or contain frozen materials.

Compaction of CLSM shall not be performed.

The maximum layer thickness for CLSM shall be determined by the Contractor. Additional layers shall not be placed until the backfill has lost sufficient moisture to be walked on without indenting more than 2 inches. Allow bleed water to rise and divert away from placement area before another layer may be added. Do not place CLSM on top of bleed water or on any water above the bearing layer. Any damage resulting from placing Flow-Fill in layers that are too thick

or from not allowing sufficient strength gain time between placement of layers shall be repaired at the **CONTRACTOR's** expense.

The maximum layer thickness for Flashfill is not restricted except to prevent flowing or running into undesired areas.

Contractor shall observe all other Construction Requirements as provided in CDOT Section 206 for placement of CLSM.

4 STREET SURFACING and PATCHING

Placement of pavement materials for vehicle traffic shall not be allowed until the removable CLSM backfill has cured 24 hours (Flow-Fill only) or achieved sufficient resistance to allow paving. CLSM (either type) should be subjected to standard proofroll criteria, or penetration resistance tests. CLSM should achieve a penetration resistance of at least 3.6 tsf (tons per square foot) (equivalent to 50 psi) using a hand-held soil penetrometer, typically pushed to ¼" depth, in accordance with the penetrometer manufacturer's instructions. Alternately, penetration resistance shall be considered achieved when a person weighing 100 pounds by use of their body weight as an axial load, cannot penetrate the CLSM backfill with the square cut end of a ½" diameter (#4) steel reinforcing bar.

4A Temporary Pavement Selection

Whenever permanent pavement patches are not constructed immediately following trench backfilling operations, temporary pavement patch construction consisting of:

- A minimum of 3 inches of hot mix asphalt (or approved warm mix if allowed) or cold plant mix asphalt on Flashfill or cured Flow-Fill CLSM , or
- A thickness of Flash-Patch equal to existing pavement thickness on CLSM, or
- Steel plates per **CITY** requirements on CLSM,

must be utilized to provide the required number of paved travel lanes. Sufficient excavation of backfill shall be done to allow the temporary surfacing to be level with surrounding pavement. Use of steel plates may be left in place for a short duration as approved by the **CITY**. Temporary pavement patches may be left in place for a maximum of 30 working days following completion of backfilling operations unless otherwise approved by the **CITY**.

or from not allowing sufficient strength gain time between placement of layers shall be repaired at the **CONTRACTOR's** expense.

The maximum layer thickness for Flashfill is not restricted except to prevent flowing or running into undesired areas.

Contractor shall observe all other Construction Requirements as provided in CDOT Section 206 for placement of CLSM.

4 STREET SURFACING and PATCHING

Placement of pavement materials for vehicle traffic shall not be allowed until the removable CLSM backfill has cured 24 hours (Flow-Fill only) or achieved sufficient resistance to allow paving. CLSM (either type) should be subjected to standard proofroll criteria, or penetration resistance tests. CLSM should achieve a penetration resistance of at least 3.6 tsf (tons per square foot) (equivalent to 50 psi) using a hand-held soil penetrometer, typically pushed to ¼" depth, in accordance with the penetrometer manufacturer's instructions. Alternately, penetration resistance shall be considered achieved when a person weighing 100 pounds by use of their body weight as an axial load, cannot penetrate the CLSM backfill with the square cut end of a ½" diameter (#4) steel reinforcing bar.

4A Temporary Pavement Selection

Whenever permanent pavement patches are not constructed immediately following trench backfilling operations, temporary pavement patch construction consisting of:

- A minimum of 3 inches of hot mix asphalt (or approved warm mix if allowed) or cold plant mix asphalt on Flashfill or cured Flow-Fill CLSM , or
- A thickness of Flash-Patch equal to existing pavement thickness on CLSM, or
- Steel plates per **CITY** requirements on CLSM,

must be utilized to provide the required number of paved travel lanes. Sufficient excavation of backfill shall be done to allow the temporary surfacing to be level with surrounding pavement. Use of steel plates may be left in place for a short duration as approved by the **CITY**. Temporary pavement patches may be left in place for a maximum of 30 working days following completion of backfilling operations unless otherwise approved by the **CITY**.

CLSM strengths, but are limited in thickness to the existing pavement thickness to allow removal.

- Flash-Patch usage on arterial roadways will require that **Small Aggregate topping** be used. Gradations shall meet ASTM C33 for size #9, and be crushed stone or natural gravels, with gradations requirements listed below:

TABLE 4B

Sieve	3/8"	#4	#8	#16	#50
% Passing	100	85 – 100	10 - 40	0 - 10	0 - 5

4C Temporary Pavement Patch Placement

Temporary asphalt should ideally be placed according to the Pikes Peak Region Asphalt Paving Specifications requirements. Any temporary asphalt pavement patch shall be placed and compacted and shall be maintained by the **CONTRACTOR** so that the patched surface and the surrounding area remain a single even (smooth) unbroken plane, suitable to handle the traffic, for the duration of Temporary Patch.

Flash-Patch usage on arterial roadways will require that the **Small Aggregate** shall be broadcast on and embedded into the surface, for increased skid-resistance. Aggregate application will occur on patches within 100 feet of approaching stop signs or signal lights on other city streets. This aggregate shall be applied at approximately 5 lb per SY of patch surface, before the Flash-Patch hardens. The **CONTRACTOR** shall be responsible to apply and embed the surface aggregate in a timely manner before set occurs.

The following **surface tolerance** for any temporary patches shall be observed. When a 10 foot straight edge is laid across the temporary patch parallel to the centerline of the street and in the direction transverse to the centerline, there shall be no more than a 3/4 inch rut, hump, or depression evident. Deteriorated temporary patches exhibiting ruts, humps, or depressions shall be repaired or replaced immediately. If the existing street exceeded the above tolerances prior to patching, then the temporary patch shall be equal to or better than the condition of the surrounding pavements.

Temporary patches with hot or cold mix asphalt may be **opened to traffic** after proper compaction and clean-up of the adjacent areas has occurred. Temporary patches of Flash-Patch may be opened to traffic usually within 1-1/2 hours after placement on arterial roadways, and usually within one hour on other streets.

4D Permanent Pavement Materials

Asphalt for replacement of Asphalt Pavement streets, shall be **HMA** (Hot Mix Asphalt), or **WMA** (Warm Mix Asphalt) if allowed by **CITY**, and shall meet the material requirements in the Pikes Peak Region Asphalt Paving Specifications for Grading S or SX with PG 64-22 binder, unless specified otherwise. Completion of the permanent patch in areas where an open graded surface course (SMA) exists shall include placement of a surface course to match the existing surface texture.

4E Permanent Pavement Construction

Prior to placing the permanent patch, the existing cuts made for trenches shall be properly prepared for final pavement patching.

Existing Asphalt Pavement shall be saw cut to a neat straight line and to a minimum 12 inches outside of the trench area. The **CITY** may require just the top lift be outside the trench edges. The resulting "T patch" edges shall not fall within existing wheel paths. Patches parallel to the direction of traffic and encompassing the wheel path shall extend to lane lines.

The **asphalt thickness** shall be the thicker of the existing depth, or the minimum depth of at least 4 inches.
A tack coat shall be applied to all edges to the existing freshly cut and/or approved well cleaned edges of asphalt pavement prior to placing new pavement.

Compaction of each lift shall be to a density of 94% (± 2%) of the maximum theoretical density of the approved Job Mix Formula, and conforming to the Pikes Peak Region Asphalt Paving Specifications.

The top of CLSM placed for temporary paving or for steel plates in section 4A shall be excavated to the top of subgrade/bottom of the final asphalt or concrete pavement level. The depth of excavation shall allow for the permanent pavement section to be equal to, or greater than, the existing section, or as otherwise required by the **CITY**.

Any improvements in the right-of-way or on private property disturbed or damaged during construction shall be replaced prior to placement of the permanent pavement patch. Damaged sections of concrete sidewalk shall be removed and replaced to the nearest expansion joint or score line. Damaged concrete curb and gutter shall be removed and replaced to the nearest contraction joint. Replacement of less than a standard length of curb and gutter will not be permitted. Integral curb, gutters, and/or sidewalk shall be replaced in their entirety.

The following **surface tolerance** for permanent pavement patch for asphalt, including any surface treatment before striping, shall be observed. The surface shall be thoroughly compacted, smooth, and free from ruts, humps, depressions, or irregularities. When a 10 foot straight-edge is laid across the permanent patch parallel to the centerline of the street and in a direction transverse to the centerline, the surface shall not vary more than 1/4 inch from the lower edge of the straight edge. Patches exhibiting deviations greater than 1/4 inch shall be replaced prior to acceptance of the patch. If the existing street exceeds the above tolerances, then the patch shall be equal or better than the condition of the surrounding pavement.

Patches shall also have a cross slope or cross section consistent with the design of the existing roadway.
