PROJECT NO.16-01

PCD No. SP-16-005  
PCD No. SF-16-017

## CERTIFICATIONS

### **Design Engineer's Statement:**

The attached drainage plan and report were prepared under my direction and supervision and are correct to the best of my knowledge and belief. Said drainage report has been prepared according to the criteria established by the County for drainage reports and said report is in conformity with the applicable master plan of the drainage basin. I accept responsibility for any liability caused by any negligent acts, errors or omissions on my part in preparing this report.

Seal

Charles K. Cothern, P.E. #24997

### **Owner/Developer's Statement:**

I, the owner/developer have read and will comply with all of the requirements specified in this drainage report and plan.

By (signature): \_\_\_\_\_

Date: \_\_\_\_\_

Title: \_\_\_\_\_

Address: \_\_\_\_\_  
\_\_\_\_\_

### **El Paso County:**

Filed in accordance with the requirements of the El Paso County Land Development Code, Drainage Criteria Manual Volumes 1 and 2, and the Engineering Criteria Manual, as amended.

Jennifer Irvine, P.E.,  
County Engineer / ECM Administrator

## **1.0 INTRODUCTION**

This report is an amendment to the Preliminary & Final Drainage report prepared by Dakota Springs Engineering and approved October 16, 2018.

### ***Purpose***

The purpose of this report is to present revisions to the preliminary and final drainage improvements associated with the construction of Springs at Waterview. Revisions are associated with previously proposed conveyance of storm flows, specifically construction of open channels in place of some of the previously proposed storm sewer pipe along Grinnell Boulevard and the main trunk line storm sewer that primarily conveys offsite flows through the property; some of the storm sewer has been downsized. No changes have been made concerning onsite or offsite hydrology or acceptance of offsite storm water through the site.

## **2.0 General Location and Description**

### ***Location***

Springs at Waterview is a planned 85-unit multi-family residential development within the north half of the northeast quarter of Section 7, Township 15 South, Range 65 West of the 6<sup>th</sup> Principal Meridian, in El Paso County, Colorado. It is located south of Goldfield Drive, east of Grinnell Boulevard, north of Bradley Road and west of Painted Sky at Waterview Filing No. 1. This portion of the Waterview development is in the Windmill Gulch Drainage Basin. Refer to Vicinity map, Appendix A Figure 1.

### ***Description of Property***

The proposed site encompasses 15.68 acres. The topography of the site and surrounding area is typical of a high desert; short prairie grass and weeds with slopes generally ranging from 1% to 9%. The area generally drains to the west.

The site is comprised of several different soil types. From the Soil Survey of El Paso County, the site falls into the following soil types:

1. "3" Ascalon sandy loam, 3 to 9 percent slopes.
2. "8" Blakeland loamy sand, 1 to 9 percent slopes.
3. "97" Truckton sandy loam, 3 to 9 percent slopes.

The Blakeland and Truckton soils are classified at Hydrological Group A and the Ascalon soil is classified as Hydrological Group B. Note: "#" indicates Soil Conservation Survey soil classification number. Hydrologic Soil Group B was used in the preparation of this report. See Appendix A Figure 2: Soils Data.

## **3.0 Drainage Basins and Sub-Basins**

### ***Major Basin Description***

Springs at Waterview residential development is located within the Windmill Gulch Drainage Basin. This report complies with the Windmill Gulch Drainage Basin Planning Study (DBPS) by Wilson and Company, the Master Development Drainage Plan for Waterview by Merrick and Company, the Preliminary Drainage Report for Waterview Phase II, also by Merrick and Company and Painted Sky at Waterview Filing 1 and 2 Final Drainage Report by Merrick and Company and the Approved Springs at Waterview PDR/FDR. All developed runoff will meet El Paso County standards for discharge rates.

### ***Floodplains***

The Flood Insurance Rate Map (FIRM No. 08041C0764-G dated 12/7/2018) indicates that there is no floodplain in the vicinity of the proposed site. See Appendix A Figure 3: FIRM Panel

## **4.0 DRAINAGE BASINS**

### ***Existing Drainage Analysis***

Please refer to the Preliminary and Final Drainage Report for Springs at Waterview, Approved on October 16, 2018, for existing drainage analysis.

### ***Proposed Drainage Analysis***

Please refer to the Preliminary and Final Drainage Report for Springs at Waterview, Approved on October 16, 2018, for proposed drainage analysis.

### ***Proposed Storm System***

The proposed storm water conveyance system presented in the approved Preliminary and Final Drainage Report of Springs at Waterview remains unchanged except for the following exceptions:

1. The Main Trunk Line Storm Sewer has been downsized on the western end
2. And the Storm Sewer that parallels Grinnell Boulevard have been replaced with open channel
3. Other minor changes are reflected on the eastern end of the main trunk line primarily related to final slopes and manhole location.

The proposed revision to the Main Trunk Line storm sewer is a reduction in the last leg of the pipe to 48-inch and a 45 degree bend in the pipe just before discharge to the channel per El Paso County Standards; an effort to reduce turbulence in the channel at junctions with storm sewer pipe. In addition, the eastern end of the storm sewer was modified to reduce disturbance of Escanaba Drive and an addition of a manhole and changes to related pipe slopes. Location of the additional manhole located just east of the western curb of Escanaba Drive was reviewed and approved by El Paso County field staff. StormCAD analysis and hydraulic grade line calculations are in Appendix C of this letter.

The proposed revision to the system parallel to Grinnell Boulevard is to replace the storm pipe with open channels. These channels will convey the developed runoff to the existing 72-inch RCP culvert

under Grinnell Blvd. Hydraulic computations for the proposed channels are contained in Appendix A of this letter.

The hydraulic analysis contained in Appendix A of the report divides the system parallel to Grinnell Blvd into three reaches, North Reach, South Reach and East Reach. The North Reach is the channel that runs between Goldfield Dr. and the 72-inch RCP culvert that crosses under Grinnell Boulevard. This reach flows southerly. The South Reach is the channel that runs northerly parallel to Grinnell Boulevard between Bradley Road and the 72-inch RCP culvert under Grinnell Boulevard. The East Reach is a short section of channel between the outfall of the storm drain running east-west through the development and the South Reach. This reach flows northwesterly and has its confluence with the South Reach approximately 115 feet south of the 72-inch RCP culvert under Grinnell Boulevard.

There is a section (section 100) in the south channel where the hydraulic computations show a velocity in excess of 5.0 fps (6.71 fps). This section is just downstream of the confluence with the east channel. Current and proposed design calls for rip rap lining of the channel in this area.

There is a section (section 200) in the north channel where the hydraulic computations show a velocity in excess of 5.0 fps (5.91 fps). This section is approximately 100 feet upstream of the 72-inch RCP culvert under Grinnell Boulevard. The existing design does not call for riprap lining in this area. The design will be revised to show the necessary riprap lining of the channel in this area. The extents of the additional riprap will be downstream to the currently designed rip rap lining and 25 feet upstream of the section.

#### Culvert Ponding and Grinnell Boulevard Inundation

The HEC RAS model (Appendix A) was modified to include the 72-inch RCP under Grinnell Boulevard as requested. The results indicated an inlet control condition. The results of the model did not provide the most accurate assessment of the culvert operation and assessment of the open channel hydraulic and ponding condition so a second model, HY-8, was used to provide more analysis of the operation of the existing 72-inch culvert, particularly in relationship to Grinnell Boulevard. The results of the HY-8 analysis can be found in Appendix B.

The approved Preliminary and Final Drainage Report recognizes the existing condition inundation of Grinnell Boulevard and provides a description and approximate inundation limits with the approved design. This letter redefines the inundation limits based on the proposed open channel hydraulics versus the approved pipe hydraulics. The calculated 100-year design storm total flow at the 72-inch RCP as approved in the Preliminary and Final Drainage Report is 239.1 cfs. Based on the approved design flow, assumed entrance losses and associated inlet control at the existing 72-inch RCP the ponding elevation for the 100-year design storm is calculated to be 5865.03 or approximately 9.0 ft. The ponding depth is translated to (backs up into) both the north and south proposed channels as shown on the HEC RAS cross sections in Appendix A.

The calculated ponding depth confirms the existing observed inundation of Grinnell Boulevard and indicates the potential for overtopping the road during the 100-year event. An HY-8 Analysis was performed to estimate, based on broad crested weir assumptions, the portion of the 100-year design storm that would continue to be conveyed through the 72-inch RCP and what portion of the 100-year storm that may overtop Grinnell Boulevard. The anticipated 100-year design storm ponding elevation with overtopping based on the HY-8 analysis would be 5862.24 (low point in the road profile is 5861.97). The HY-8 analysis provided in Appendix B indicates that 210.65 cfs of the 239.1 cfs would be

conveyed through the 72-inch RCP. This ponding elevation is 5862.24. This ponding elevation is 3.24-inches at the lowest point along the centerline of Grinnell Boulevard.

The ponding elevation of 72-inches is the same as the 72-inch RCP.

The overtopping of this proposed redesign does not meet the cross flow in Arterial road with roadside ditch per DCM Table 6-1. The criteria for major storm is that flow shall not encroach upon the road shoulder. Therefore the proposed design does not meet the criteria.

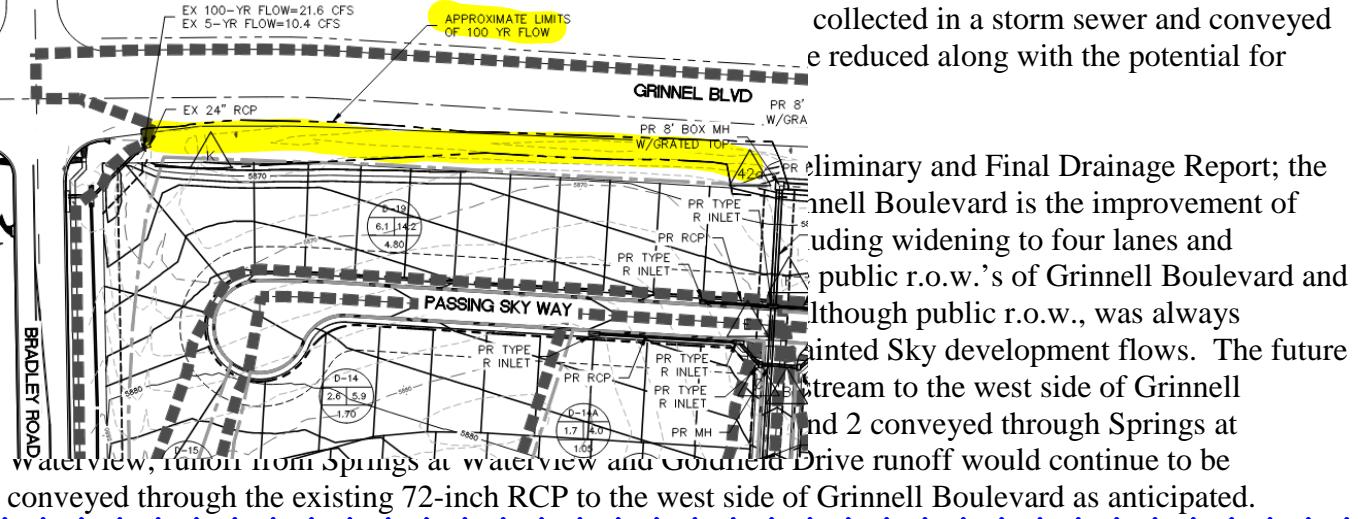

The approved FDR's analysis showed the 100yr flow stays within the shoulder with no overtopping of Grinnell Blvd.

Review of the 100-year design storm hydrology from the approved Preliminary and Final Drainage Report indicates that the calculated 100-year design flow from the Bradley Road storm sewer is 21.6 cfs. The following 3 Design Basins include a portion of Grinnell Boulevard:

Basin	100-Year Design Flow (CFS)
D-19	14.2 cfs
D-18	9.2 cfs
D-17	<u>7.1 cfs</u>
	30.5 cfs

Assuming that 50% of the Basin flows that include Grinnell Boulevard are generated by the paved surface of Grinnell Boulevard the estimated flow from the Public right-of-ways of Bradley Road and Grinnell Boulevard would be approximately 36.85 cfs ( $30.5 \text{ cfs} \times 0.5 + 21.6 \text{ cfs} = 36.85 \text{ cfs}$ ). This total flow is in excess of the calculated flow overtopping Grinnell Boulevard of 28.02 cfs. If 100-year public

collected in a storm sewer and conveyed e reduced along with the potential for

## 5.0 DRAINAGE FEES, COST ESTIMATE & MAINTENANCE

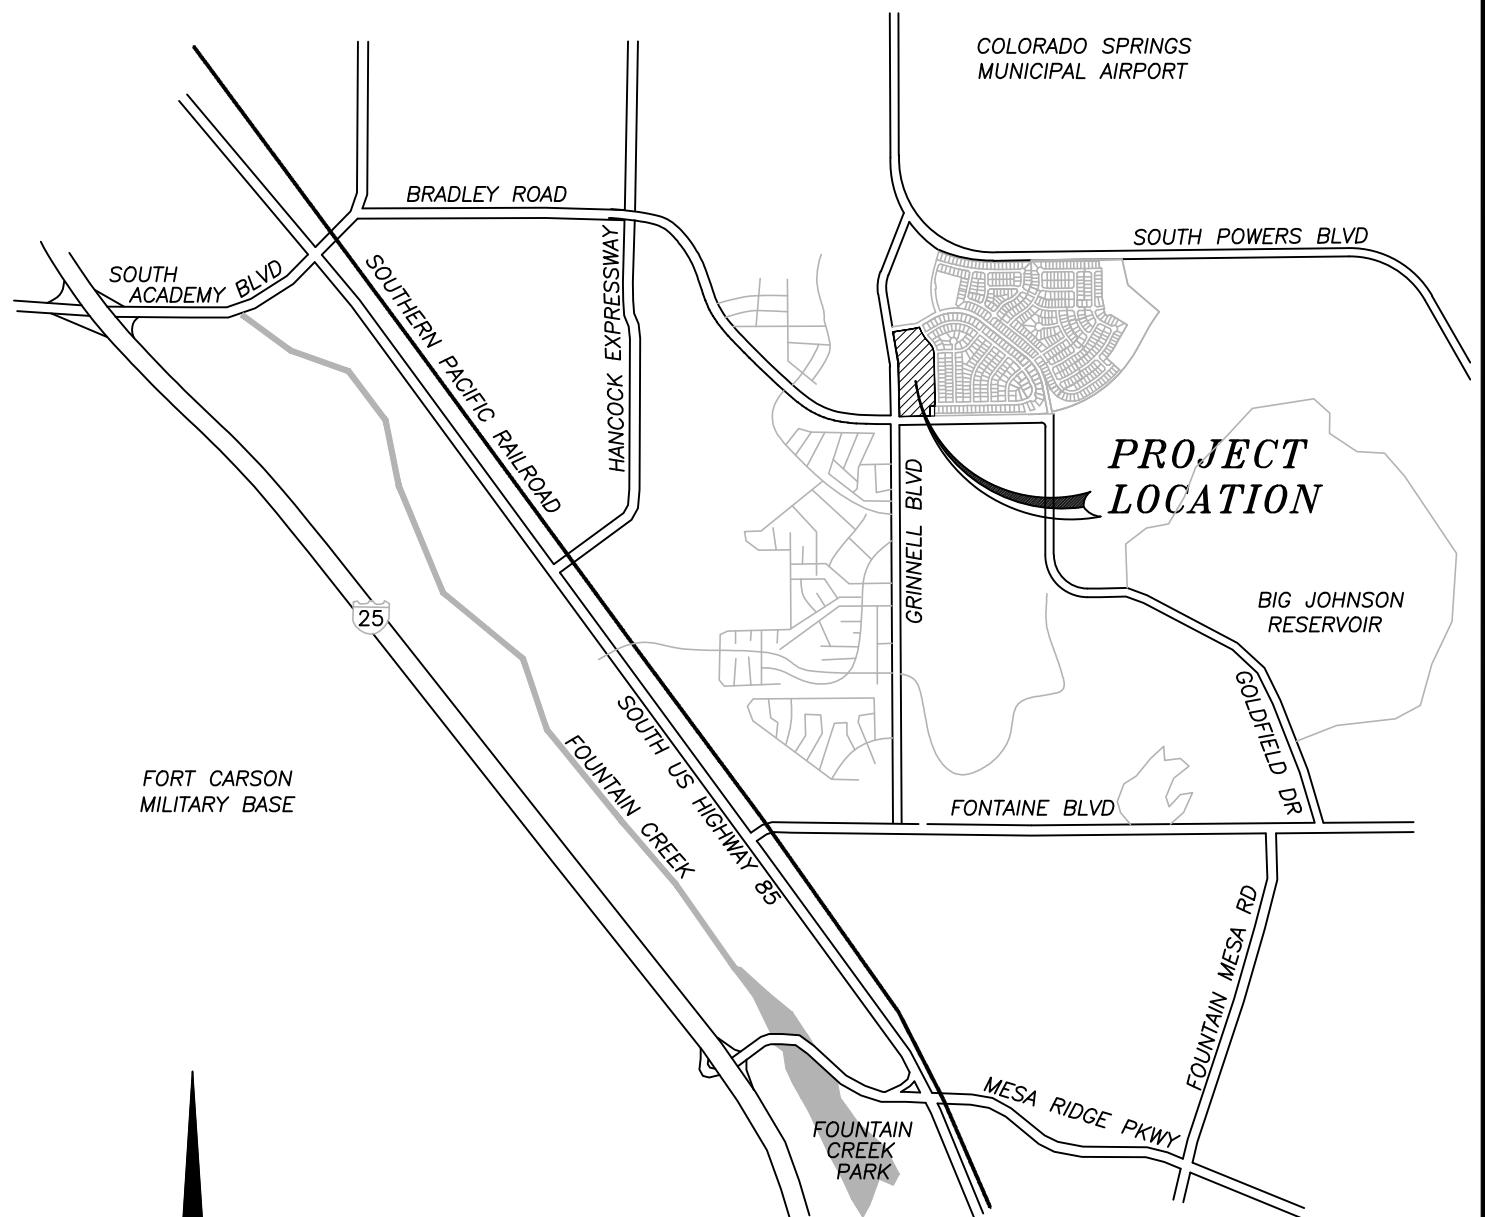

There are no additional fees required for this development as a result of the amendments to the approved Preliminary and Final Drainage Report for Springs at Waterview, presented in this Drainage Letter. Those portions of the approved drainage report that established fees for this development remain unchanged. The amendment only addresses changes in conveyance along Grinnell Blvd.

Add cost estimate for the proposed amendment and summarize the difference in cost from the approved design.

# Custom Soil Resource Report for El Paso County Area, Colorado

# Preface

---

Soil surveys contain information that affects land use planning in survey areas. They highlight soil limitations that affect various land uses and provide information about the properties of the soils in the survey areas. Soil surveys are designed for many different users, including farmers, ranchers, foresters, agronomists, urban planners, community officials, engineers, developers, builders, and home buyers. Also, conservationists, teachers, students, and specialists in recreation, waste disposal, and pollution control can use the surveys to help them understand, protect, or enhance the environment.

Various land use regulations of Federal, State, and local governments may impose special restrictions on land use or land treatment. Soil surveys identify soil properties that are used in making various land use or land treatment decisions. The information is intended to help the land users identify and reduce the effects of soil limitations on various land uses. The landowner or user is responsible for identifying and complying with existing laws and regulations.

Although soil survey information can be used for general farm, local, and wider area planning, onsite investigation is needed to supplement this information in some cases. Examples include soil quality assessments (<http://www.nrcs.usda.gov/wps/portal/nrcs/main/soils/health/>) and certain conservation and engineering applications. For more detailed information, contact your local USDA Service Center (<http://offices.sc.egov.usda.gov/locator/app?agency=nrcs>) or your NRCS State Soil Scientist ([http://www.nrcs.usda.gov/wps/portal/nrcs/detail/soils/contactus/?cid=nrcs142p2\\_053951](http://www.nrcs.usda.gov/wps/portal/nrcs/detail/soils/contactus/?cid=nrcs142p2_053951)).

Great differences in soil properties can occur within short distances. Some soils are seasonally wet or subject to flooding. Some are too unstable to be used as a foundation for buildings or roads. Clayey or wet soils are poorly suited to use as septic tank absorption fields. A high water table makes a soil poorly suited to basements or underground installations.

The National Cooperative Soil Survey is a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local agencies. The Natural Resources Conservation Service (NRCS) has leadership for the Federal part of the National Cooperative Soil Survey.

Information about soils is updated periodically. Updated information is available through the NRCS Web Soil Survey, the site for official soil survey information.

The U.S. Department of Agriculture (USDA) prohibits discrimination in all its programs and activities on the basis of race, color, national origin, age, disability, and where applicable, sex, marital status, familial status, parental status, religion, sexual orientation, genetic information, political beliefs, reprisal, or because all or a part of an individual's income is derived from any public assistance program. (Not all prohibited bases apply to all programs.) Persons with disabilities who require alternative means

for communication of program information (Braille, large print, audiotape, etc.) should contact USDA's TARGET Center at (202) 720-2600 (voice and TDD). To file a complaint of discrimination, write to USDA, Director, Office of Civil Rights, 1400 Independence Avenue, S.W., Washington, D.C. 20250-9410 or call (800) 795-3272 (voice) or (202) 720-6382 (TDD). USDA is an equal opportunity provider and employer.

### MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service  
Web Soil Survey URL: <http://websoilsurvey.nrcs.usda.gov>  
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: El Paso County Area, Colorado  
Survey Area Data: Version 13, Sep 22, 2015

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Jun 3, 2014—Jun 17, 2014

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

## Map Unit Descriptions

The map units delineated on the detailed soil maps in a soil survey represent the soils or miscellaneous areas in the survey area. The map unit descriptions, along with the maps, can be used to determine the composition and properties of a unit.

A map unit delineation on a soil map represents an area dominated by one or more major kinds of soil or miscellaneous areas. A map unit is identified and named according to the taxonomic classification of the dominant soils. Within a taxonomic class there are precisely defined limits for the properties of the soils. On the landscape, however, the soils are natural phenomena, and they have the characteristic variability of all natural phenomena. Thus, the range of some observed properties may extend beyond the limits defined for a taxonomic class. Areas of soils of a single taxonomic class rarely, if ever, can be mapped without including areas of other taxonomic classes. Consequently, every map unit is made up of the soils or miscellaneous areas for which it is named and some minor components that belong to taxonomic classes other than those of the major soils.

Most minor soils have properties similar to those of the dominant soil or soils in the map unit, and thus they do not affect use and management. These are called noncontrasting, or similar, components. They may or may not be mentioned in a particular map unit description. Other minor components, however, have properties and behavioral characteristics divergent enough to affect use or to require different management. These are called contrasting, or dissimilar, components. They generally are in small areas and could not be mapped separately because of the scale used. Some small areas of strongly contrasting soils or miscellaneous areas are identified by a special symbol on the maps. If included in the database for a given area, the contrasting minor components are identified in the map unit descriptions along with some characteristics of each. A few areas of minor components may not have been observed, and consequently they are not mentioned in the descriptions, especially where the pattern was so complex that it was impractical to make enough observations to identify all the soils and miscellaneous areas on the landscape.

The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The objective of mapping is not to delineate pure taxonomic classes but rather to separate the landscape into landforms or landform segments that have similar use and management requirements. The delineation of such segments

## Custom Soil Resource Report

on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, however, onsite investigation is needed to define and locate the soils and miscellaneous areas.

An identifying symbol precedes the map unit name in the map unit descriptions. Each description includes general facts about the unit and gives important soil properties and qualities.

Soils that have profiles that are almost alike make up a *soil series*. Except for differences in texture of the surface layer, all the soils of a series have major horizons that are similar in composition, thickness, and arrangement.

Soils of one series can differ in texture of the surface layer, slope, stoniness, salinity, degree of erosion, and other characteristics that affect their use. On the basis of such differences, a soil series is divided into *soil phases*. Most of the areas shown on the detailed soil maps are phases of soil series. The name of a soil phase commonly indicates a feature that affects use or management. For example, Alpha silt loam, 0 to 2 percent slopes, is a phase of the Alpha series.

Some map units are made up of two or more major soils or miscellaneous areas. These map units are complexes, associations, or undifferentiated groups.

A *complex* consists of two or more soils or miscellaneous areas in such an intricate pattern or in such small areas that they cannot be shown separately on the maps. The pattern and proportion of the soils or miscellaneous areas are somewhat similar in all areas. Alpha-Beta complex, 0 to 6 percent slopes, is an example.

An *association* is made up of two or more geographically associated soils or miscellaneous areas that are shown as one unit on the maps. Because of present or anticipated uses of the map units in the survey area, it was not considered practical or necessary to map the soils or miscellaneous areas separately. The pattern and relative proportion of the soils or miscellaneous areas are somewhat similar. Alpha-Beta association, 0 to 2 percent slopes, is an example.

An *undifferentiated group* is made up of two or more soils or miscellaneous areas that could be mapped individually but are mapped as one unit because similar interpretations can be made for use and management. The pattern and proportion of the soils or miscellaneous areas in a mapped area are not uniform. An area can be made up of only one of the major soils or miscellaneous areas, or it can be made up of all of them. Alpha and Beta soils, 0 to 2 percent slopes, is an example.

Some surveys include *miscellaneous areas*. Such areas have little or no soil material and support little or no vegetation. Rock outcrop is an example.

## El Paso County Area, Colorado

### 3—Ascalon sandy loam, 3 to 9 percent slopes

#### Map Unit Setting

*National map unit symbol:* 2tlny  
*Elevation:* 3,870 to 5,960 feet  
*Mean annual precipitation:* 13 to 18 inches  
*Mean annual air temperature:* 46 to 54 degrees F  
*Frost-free period:* 95 to 155 days  
*Farmland classification:* Not prime farmland

#### Map Unit Composition

*Ascalon and similar soils:* 85 percent  
*Minor components:* 15 percent  
*Estimates are based on observations, descriptions, and transects of the mapunit.*

#### Description of Ascalon

##### Setting

*Landform:* Interfluves  
*Landform position (two-dimensional):* Backslope  
*Landform position (three-dimensional):* Side slope  
*Down-slope shape:* Linear  
*Across-slope shape:* Linear  
*Parent material:* Wind-reworked alluvium and/or calcareous sandy eolian deposits

##### Typical profile

*Ap - 0 to 6 inches:* sandy loam  
*Bt1 - 6 to 12 inches:* sandy clay loam  
*Bt2 - 12 to 19 inches:* sandy clay loam  
*Bk1 - 19 to 35 inches:* fine sandy loam  
*Bk2 - 35 to 80 inches:* fine sandy loam

##### Properties and qualities

*Slope:* 3 to 9 percent  
*Depth to restrictive feature:* More than 80 inches  
*Natural drainage class:* Well drained  
*Runoff class:* Medium  
*Capacity of the most limiting layer to transmit water (Ksat):* Moderately high to high (0.60 to 5.98 in/hr)  
*Depth to water table:* More than 80 inches  
*Frequency of flooding:* None  
*Frequency of ponding:* None  
*Calcium carbonate, maximum in profile:* 10 percent  
*Salinity, maximum in profile:* Nonsaline (0.1 to 1.9 mmhos/cm)  
*Sodium adsorption ratio, maximum in profile:* 1.0  
*Available water storage in profile:* Moderate (about 7.1 inches)

##### Interpretive groups

*Land capability classification (irrigated):* 6e  
*Land capability classification (nonirrigated):* 6e  
*Hydrologic Soil Group:* B  
*Ecological site:* Sandy Plains (R067BY024CO)

### **Minor Components**

#### **Olnest**

*Percent of map unit:* 10 percent  
*Landform:* Interfluves  
*Landform position (two-dimensional):* Backslope  
*Landform position (three-dimensional):* Side slope  
*Down-slope shape:* Linear  
*Across-slope shape:* Linear  
*Ecological site:* Sandy Plains (R067BY024CO)

#### **Vona**

*Percent of map unit:* 5 percent  
*Landform:* Interfluves  
*Landform position (two-dimensional):* Backslope  
*Landform position (three-dimensional):* Side slope  
*Down-slope shape:* Linear  
*Across-slope shape:* Linear  
*Ecological site:* Sandy Plains (R067BY024CO)

## **8—Blakeland loamy sand, 1 to 9 percent slopes**

### **Map Unit Setting**

*National map unit symbol:* 369v  
*Elevation:* 4,600 to 5,800 feet  
*Mean annual precipitation:* 14 to 16 inches  
*Mean annual air temperature:* 46 to 48 degrees F  
*Frost-free period:* 125 to 145 days  
*Farmland classification:* Not prime farmland

### **Map Unit Composition**

*Blakeland and similar soils:* 85 percent  
*Estimates are based on observations, descriptions, and transects of the mapunit.*

### **Description of Blakeland**

#### **Setting**

*Landform:* Flats, hills  
*Landform position (three-dimensional):* Side slope, talus  
*Down-slope shape:* Linear  
*Across-slope shape:* Linear  
*Parent material:* Alluvium derived from sedimentary rock and/or eolian deposits derived from sedimentary rock

#### **Typical profile**

*A - 0 to 11 inches:* loamy sand  
*AC - 11 to 27 inches:* loamy sand  
*C - 27 to 60 inches:* sand

**Properties and qualities**

*Slope:* 1 to 9 percent

*Depth to restrictive feature:* More than 80 inches

*Natural drainage class:* Somewhat excessively drained

*Runoff class:* Low

*Capacity of the most limiting layer to transmit water (Ksat):* High to very high (5.95 to 19.98 in/hr)

*Depth to water table:* More than 80 inches

*Frequency of flooding:* None

*Frequency of ponding:* None

*Calcium carbonate, maximum in profile:* 5 percent

*Available water storage in profile:* Low (about 4.5 inches)

**Interpretive groups**

*Land capability classification (irrigated):* 3e

*Land capability classification (nonirrigated):* 6e

*Hydrologic Soil Group:* A

*Ecological site:* Sandy Foothill (R049BY210CO)

**Minor Components**

**Other soils**

*Percent of map unit:*

**Pleasant**

*Percent of map unit:*

*Landform:* Depressions

**97—Truckton sandy loam, 3 to 9 percent slopes**

**Map Unit Setting**

*National map unit symbol:* 36bg

*Elevation:* 6,000 to 7,000 feet

*Mean annual precipitation:* 14 to 16 inches

*Mean annual air temperature:* 46 to 50 degrees F

*Frost-free period:* 125 to 145 days

*Farmland classification:* Not prime farmland

**Map Unit Composition**

*Truckton and similar soils:* 80 percent

*Estimates are based on observations, descriptions, and transects of the mapunit.*

**Description of Truckton**

**Setting**

*Landform:* Hills

*Landform position (three-dimensional):* Side slope

*Down-slope shape:* Linear

*Across-slope shape:* Linear

## Custom Soil Resource Report

*Parent material:* Arkosic alluvium derived from sedimentary rock and/or arkosic residuum weathered from sedimentary rock

### Typical profile

A - 0 to 8 inches: sandy loam  
Bt - 8 to 24 inches: sandy loam  
C - 24 to 60 inches: coarse sandy loam

### Properties and qualities

*Slope:* 3 to 9 percent  
*Depth to restrictive feature:* More than 80 inches  
*Natural drainage class:* Well drained  
*Runoff class:* Low  
*Capacity of the most limiting layer to transmit water (Ksat):* High (1.98 to 6.00 in/hr)  
*Depth to water table:* More than 80 inches  
*Frequency of flooding:* None  
*Frequency of ponding:* None  
*Available water storage in profile:* Low (about 5.7 inches)

### Interpretive groups

*Land capability classification (irrigated):* 4e  
*Land capability classification (nonirrigated):* 6e  
*Hydrologic Soil Group:* A  
*Ecological site:* Sandy Foothill (R049BY210CO)

### Minor Components

#### Haplaquolls

*Percent of map unit:*  
*Landform:* Marshes

#### Other soils

*Percent of map unit:*

#### Pleasant

*Percent of map unit:*  
*Landform:* Depressions

#### Plan Summary Information:

Number of: Cross Sections = 19    Multiple Openings = 0  
Culverts = 1    Inline Structures = 0  
Bridges = 0    Lateral Structures = 0

#### Computational Information

Water surface calculation tolerance = 0.01  
Critical depth calculation tolerance = 0.01

Maximum number of iterations	= 20
Maximum difference tolerance	= 0.3
Flow tolerance factor	= 0.001

#### Computation Options

Critical depth computed at all cross sections
Conveyance Calculation Method: At breaks in n values only
Friction Slope Method: Average Conveyance
Computational Flow Regime: Subcritical Flow

#### FLOW DATA

Warning: The energy equation could not be balanced within the specified number of iterations. The program used critical depth for the water surface and continued on with the calculations.

Warning: During the standard step iterations, when the assumed water surface was set equal to critical depth, the calculated

water surface came back below critical depth. This indicates that there is not a valid subcritical answer. The program defaulted to critical depth.

Warning: The energy equation could not be balanced within the specified number of iterations. The program used critical

depth for the water surface and continued on with the calculations.

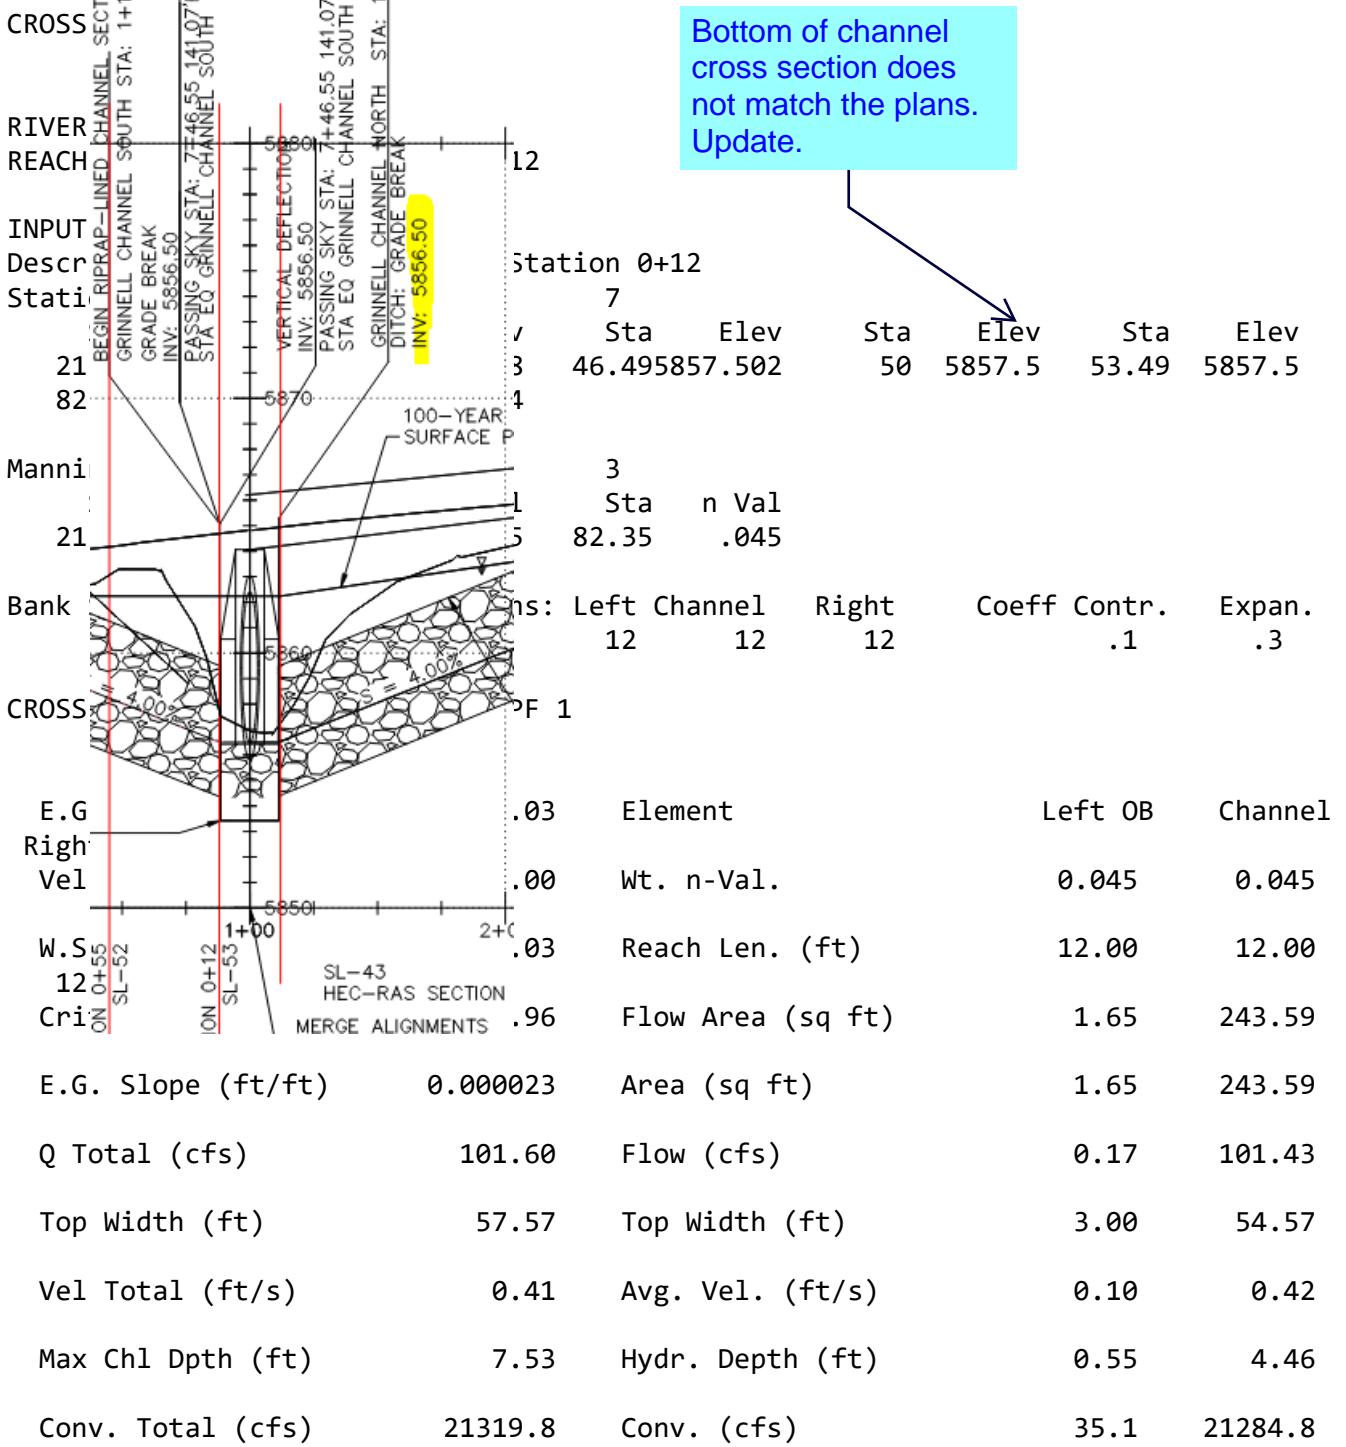

Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than

1.4. This may indicate the need for additional cross sections.

Warning: The energy loss was greater than 1.0 ft (0.3 m). between the current and previous cross section. This may indicate  
the need for additional cross sections.

Warning: During the standard step iterations, when the assumed water surface was set equal to critical depth, the calculated water surface came back below critical depth. This indicates that there is not a valid subcritical answer. The program defaulted to critical depth.

The overtopping of this proposed redesign does not meet the cross flow in Arterial road with roadside ditch per DCM Table 6-1. The criteria for major storm is that flow shall not encroach upon the road shoulder. Therefore the proposed design does not meet the criteria.

The approved FDR's analysis showed the 100yr flow stays within the shoulder with no overtopping of Grinnell Blvd.
