

**MASTER DEVELOPMENT DRAINAGE PLAN  
AMENDMENT  
FOR  
FOREST LAKES (FOREST LAKES PHASE 2)  
EL PASO COUNTY, COLORADO**

**December 2017**

With the application being a PUDSP (combined PUD & Preliminary Plan), this drainage report title and content should be a combined amendment to the MDDP and Preliminary Drainage Report For Forest Lakes Ph 2.

# MASTER DEVELOPMENT DRAINAGE PLAN AMENDMENT FOR FOREST LAKES (FOREST LAKES PHASE 2)

## ENGINEER'S STATEMENT:

The attached drainage plan and report were prepared under my direction and supervision and are correct to the best of my knowledge and belief. Said drainage report has been prepared according to the criteria established by the El Paso County for drainage reports and said report is in conformity with the master plan of the drainage basin. I accept responsibility for any liability caused by any negligent acts, errors, or omissions on my part in preparing this report.

\_\_\_\_\_

Date

## DEVELOPER'S STATEMENT:

I, the developer, have read and will comply with all of the requirements specified in this drainage report and plan.

Business Name: Forest Lakes Residential Development, LLC

By: \_\_\_\_\_

Title: \_\_\_\_\_

Address: 6385 Corporate Drive, Suite 200

Colorado Springs, CO 80919

## EL PASO COUNTY ONLY:

Filed in accordance with the requirements of the Drainage Criteria Manual, Volumes 1 and 2, El Paso County Engineering Criteria Manual and Land Development Code as amended.

# MASTER DEVELOPMENT DRAINAGE PLAN AMENDMENT FOR FOREST LAKES (FOREST LAKES PHASE 2)

## PURPOSE

This document is the Master Development Drainage Plan Amendment for Forest Lakes (Forest Lakes Phase 2). The purpose of this report is to identify general onsite and offsite drainage patterns, storm sewer corridors and areas tributary to the site, and to safely route developed storm water runoff to adequate treatment and outfall facilities. Based upon the revisions to the Phase 2 site layout. The proposed Phase 2 development shall be in adherence to the El Paso County approved Master Development Drainage Plan for Forest Lakes as well as current County Drainage Criteria.

## PROJECT DESCRIPTION

The Forest Lakes development is a phased master planned community located in northern El Paso County, Colorado. The master planned land includes areas of open space, residential, trails, drainage, preservation and two water supply reservoirs. The property lies to the east of Pike National Forest, north of the United States Air Force Academy, west of Interstate 25 and south of the Town of Monument. The Forest Lakes property is located in portions of Sections 27, 28, 29 and 33 of Township 11 South, Range 67 West of the Sixth Principal Meridian and covers approximately 900 acres. The proposed amendment area (Phase 2) is the far westerly area east of Filing 1 and is comprised of 287 acres. Watersheds that impact the Phase 2 property include Beaver Creek, Hell Creek and North Beaver Creek. These watersheds are tributary to Monument Creek. Monument Creek itself passes along the eastern boundary of the overall Forest Lakes property in a north to south direction. The purpose of the amended Master Development Drainage Plan analysis is to provide existing and updated developed peak flow data for the 5-year and 100-year recurrence intervals within the Phase 2 portion of the property. This information has been used to develop overall drainage design information and to identify the required storm drainage and flood control facilities within the Phase 2 property. The vicinity map for the Phase 2 Amendment area is presented in the Appendix of this report.

The initial approved Master Development Drainage Plan titled, "Forest Lakes Master Development Drainage Plan", was approved by Kiowa Engineering Corporation and dated April 11, 2002. The following is an excerpt from that report:

"The hydrology analysis for the initially approved Forest Lakes Master Development Drainage Plan was completed in three phases. The first phase is a regional hydrologic analysis. The regional hydrology model uses an elliptical rainfall distribution patterns based upon Hydromet 52. The regional analysis was conducted in order to assess the development's overall impact upon peak

discharges within Monument Creek as it passes in Forest Lakes development. The hydrology development in the Monument Creek Drainage Basin Planning Study (DBPS) was utilized as a basis for the regional analysis. The existing and developed basin hydrologic conditions were analyzed. The second phase was a localized hydrologic analysis that focused upon determining the peak discharges along the major drainageways within the property. For this phase, a Type II storm pattern was assumed over the drainage basins associated with the Forest Lakes development. This analysis was developed in order to provide information in use in modeling floodplains and sizing of major drainageway facilities. The third phase was an on-site developed condition hydrologic analysis, using the Rational Method to determine the peak flows within the property to size and locate on site hydraulic structures.”

For this Phase 2 Amendment, detailed analysis of initial/local systems will be deferred to the future final drainage reports when platting is proposed.

Presented on Exhibit A (reduced scale map from initial MDDP in appendix) is information for the major sub-watershed information that impact the Forest Lakes property, including Hell Creek, Beaver Creek and North Beaver Creek. The sub-watersheds shown on Exhibit A were used in the hydrologic analysis for the regional and localized hydrologic analysis described above. Beaver Creek courses through the center of the Forest Lakes Development from west to east. The most significant feature within the Beaver Creek watershed is Bristlecone Lake and Pinon Lake which are not affected by this Phase 2 Amendment. These lakes and their embankments were constructed in 1986 as water supply reservoirs.

The site is located within the Beaver Creek Drainage Basin.

## **PREVIOUS REPORTS**

Several studies were reviewed in the preparation of the initial Master Development Drainage Plan and this Phase 2 Amendment. These studies include:

1. Master Plan Level Geologic Hazards Evaluation and Preliminary Geotechnical Investigation, Forest Lakes Master Development Plan, prepared by CTL/Thompson, Inc. dated July 31, 2001.
2. Forest Lakes Master Development Drainage Plan, prepared by Kiowa Engineering Corporation dated April 11, 2002.
3. City of Colorado Springs and El Paso County Flood Insurance Study, prepared by Federal Emergency Management Agency, dated Marcy 1997.

4. City of Colorado Springs Drainage Criteria Manual Volume 1, May 2014.
5. Drainage Criteria Manual (Volume 3) latest revision April 2008, Urban Drainage and Flood Criteria District.
6. Baseline Hydrology Study, Monument Creek Drainage Basin Planning Study, prepared by CH2M Hill, Inc. and Kiowa Engineering Corporation dated May 1992.
7. Forest Lakes Master Drainage Plan and Phase 1 Drainage Report, prepared by KKBNA, Inc. dated November 1986.
8. Procedures for Determining Peak Flows in Colorado, Incorporates and Supplements Technical Release No. 55, prepared by Soil Conservation Service, dated March 1980.

The Forest Lakes Master Development Drainage Plan (MDDP) dated November 1986, was prepared as a part of the planning for the property which originally began in 1986. This MDDP (1986) was prepared using the City/County drainage criteria that were in affect at the time. Peak flow data was developed for the watersheds that pass through the property. Drainageway improvements, detention basin plans and roadway crossing sizes were developed for the proposed development condition for the initially developed areas.

## **SOILS AND GEOLOGY**

Soils within the watersheds that are tributary to the Forest Lakes property vary between soil types A through D, as identified by the U.S. Department of Agriculture, Soil Conservation Service. Soils are classified in hydrologic groups A, B, C, and D according to their infiltration capacity. Type D soils are dominant in the forested areas west of Monument Creek. These soils are generally associated with the Pikes Peak Granite found in the region. This is particularly true for the forested portion of the Beaver Creek watershed. The decomposed granite soils exhibit extremely high rates of runoff and are very susceptible to erosion and sedimentation. Hydrologic Soils Group A soils consist chiefly of well-drained sand and gravel and have a low runoff potential. The soils within the Forest Lakes property are predominantly soil type B. See Appendix for additional information.

## **DRAINAGE CRITERIA**

The hydrology for the major sub-watersheds (i.e., Beaver Creek), were estimated using the methods outlined in the initial Master Development Drainage Plan. Exhibit A presents the major sub-watersheds that impact the Forest Lakes property. All updated calculations for the Phase 2 Amendment area were performed using the following:

Hydrologic calculations were performed using the City of Colorado Springs/El Paso County Drainage Criteria Manual, as revised in November 1991 and October 1994. Stormwater quality analysis and Extended Detention Basin (EDB) design are per the Urban Drainage and Flood Control District Manual and UD-BMP Version 3.01 spreadsheet. The Rational Method was used to estimate stormwater runoff to the proposed inlets and storm sewer pipes and for comparison purposes to the runoff rates found within the previous reports.

## **FLOODPLAIN STATEMENT**

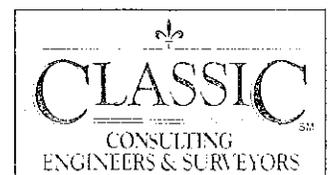

A portion of this site is located within a floodplain as determined by the Flood Insurance Rate Maps (F.I.R.M.) Map Number 08041C 0270F effective date, March 17, 1997 (See Appendix). No proposed development is anticipated to take place within the floodplain other than two proposed roadway crossings as reflected on the drainage maps. At the time of the Final Drainage Report submittal, FEMA coordination will be initiated for this section of North Beaver Creek where the floodplain as reflected on the maps does not correspond to the site topography.

## **EXISTING MAJOR DRAINAGEWAYS**

Four major drainageways flow onto the Forest Lakes site, including North Beaver Creek, South Beaver Creek and Hell Creek. Hell Creek, North and South Beaver Creek converge in the western portion of the site to form Beaver Creek. Beaver Creek continues through the site on an easterly course through Bristle Cone Lake over the reservoir spillway. The drainageways are well defined and heavily vegetated. The bottom width of the drainageways range from 5-feet in the smaller Hell Creek to 10-feet in the larger Beaver Creek.

The intent of the Phase 2 site development is to leave the major drainageways in their existing form to the greatest practical extent possible. There may be the need for localized drainageway improvements should long-term degradation of the drainageway banks or inverts occur as South Beaver Creek, Beaver Creek and Hell Creek include both wetlands and Preble's Jumping Mouse habitat. Minimal disturbance only to the fringe to wetland areas is proposed, no mouse area disturbance is anticipated.

Two road crossings of the existing drainageways are planned with Phase 2. These two crossings will be along North Beaver Creek upstream of the confluence between North and South Beaver Creek. The proposed culverts under the road crossings along North Beaver Creek have been designed to convey the 100-year bulked flow using the bulking factor recommended in the prior analysis.

**PR** Expand on the narrative. What is the diversion catchment area shown on the map and is the conveyance anticipated to be a drainage channel or pipe?

by off-site tributary flows from the west and north.

Westerly off-site Basin OS-1 ( $Q_5 = 22$  cfs and  $Q_{100} = 158$  cfs) generated flows from the adjacent national forest. With final design, these flows will be routed south away from the proposed development area directly into South Beaver Creek. Additional details within future final drainage reports will detail the design of these diversions.

**Basin A** ( $Q_5 = 21$  cfs and  $Q_{100} = 67$  cfs) are single-family lots and public street flows from the area west of Forest Lakes Drive. These flows will be intercepted by proposed public storm inlets and piped and routed to proposed Bond B, described later in this section.

**Basin C** ( $Q_5 = 19$  cfs and  $Q_{100} = 61$  cfs) and **Basin B** ( $Q_5 = 6$  cfs and  $Q_{100} = 43$  cfs) are comprised of the large knoll and adjacent proposed single-family lots that will be intercepted by proposed public storm inlets and piped and routed to proposed Bond B, described later in this section.

**Basin D** ( $Q_5 = 5$  cfs and  $Q_{100} = 35$  cfs), **Basin E** ( $Q_5 = 6$  cfs and  $Q_{100} = 19$  cfs), **Basin OS-2** ( $Q_5 = 6$  cfs and  $Q_{100} = 46$  cfs), **Basin OS-3** ( $Q_5 = 7$  cfs and  $Q_{100} = 49$  cfs), **Basin J** ( $Q_5 = 14$  cfs and  $Q_{100} = 25$  cfs), **Basin K** ( $Q_5 = 1.4$  cfs and  $Q_{100} = 10$  cfs), **Basin F** ( $Q_5 = 28$  cfs and  $Q_{100} = 88$  cfs), **Basin H** ( $Q_5 = 1.1$  cfs and  $Q_{100} = 8$  cfs), and **Basin I** ( $Q_5 = 3$  cfs and  $Q_{100} = 24$  cfs). Developed lot and street flows are collected within proposed street curb inlets and routed via public storm pipes to Pond C. See description below for Pond C.

**Basin G** ( $Q_5 = 1.3$  cfs and  $Q_{100} = 10$  cfs) are open space flows tributary to North Beaver Creek that are routed south into the South Beaver Creek confluence and not routed into Pond C.

**Full Spectrum Detention.**  
**EURV and stormwater Quality Capture Volume** spreadsheet has been provided in the Appendix of this report to provide for EURV, with a minimum drain time of 72 hours.

requirements for Full Spectrum detention (WQCV, EURV, and 100-yr storm).  
Drain time is 40hrs for WQCV, 97% of all of the runoff from rainfall event less than 5-yr storm within 72 hrs, and 99% of all of the runoff from rainfall event greater than 5-yr storm within 120 hrs.

**Detention Summary:**

**Proposed Detention Facility A** is a 1.522 ac-ft EURV facility. A storm pipe will outlet the stormwater from the pond and will convey flows to the designated outfall location at along South Beaver Creek. Total inflow to this facility is  $Q_{100} = 68.4$  cfs. This pond will store and treat developed stormwater from Forest Lakes Phase 2 and the off-site tributary portions of the adjacent park as described in this report. A vast majority of Basin OS-1 (80.30 acres) drains historically to South Beaver Creek, however it is anticipated with future development that this area will be routed south away from

Revise to Full Spectrum detention facility. (typical comment for all detention facilities)

the development area. Historic release for the area tributary to Facility A pond is  $Q_{100} = 43.2$  cfs. The EURV design of this pond ensures that all discharges (2, 5, 10, 25, 50 and 100 year) will be released at or below historic release rates. Appropriate energy dissipation measures will be included in the construction drawings at the outlet pipe connection to existing South Beaver Creek to provide for permanent erosion protection. The proposed outlet structure will include the UDFCD required 3' hole perforated orifice plate. Reference worksheets in Appendix for details. This facility and outlet structure will be designed and constructed with future filing drainage improvements. Final pond design, outlet structure sizing, trickle channel and forebay details will be included with final construction drawings for review and approval by El Paso County prior to construction.

Is this a typo?

**Proposed Detention Facility B** is a 24.13 ac-ft pond. This pond treats 39.54 acres of upstream tributary development area. As described in this report, offsite historic flows have been routed to bypass this facility along North Beaver Creek. Historic release for the 39.54 acres tributary to Facility C pond is  $Q_{100} = 67$  cfs. The EURV design of this pond ensures that all discharges (2, 5, 10, 25, 50 and 100 year) will be released at or below historic release rates. Appropriate energy dissipation measures will be included in the construction drawings at the outlet pipe connection to existing Black Squirrel Creek to provide for permanent erosion protection. The proposed outlet structure will include the UDFCD required 3' hole perforated orifice plate. Reference worksheets in Appendix for details. This facility and outlet structure will be constructed with future filing drainage improvements. Final pond design, outlet structure sizing, trickle channel and forebay details will be included with final construction drawings for review and approval by El Paso County prior to construction approval in conjunction with future Final Plat submittals.

Is pond C the combination of the two ponds bisected by Forest Lakes Drive? Elaborate the narrative and revise the drainage design calculation to be a pond in a series.

**Proposed Detention Facility C** is a 5.275 ac-ft pond. This pond treats 75.42 acres of upstream tributary development area. As described in this report, offsite historic flows have been routed to bypass this facility along Beaver Creek. Historic release for the 75.42 acres tributary to Facility C pond is  $Q_{100} = 103$  cfs. The EURV design of this pond ensures that all discharges (2, 5, 10, 25, 50 and 100 year) will be released at or below historic release rates. Appropriate energy dissipation measures will be included in the construction drawings at the outlet pipe connection to existing Black Squirrel Creek to provide for permanent erosion protection. The proposed outlet structure will include the UDFCD required 3' hole perforated orifice plate. Reference worksheets in Appendix for details. This facility and outlet structure will be constructed with future filing drainage improvements. Final pond design, outlet structure sizing, trickle channel and forebay details will be included with final construction drawings for review and approval by El Paso County prior to construction approval in conjunction with future Final Plat submittals.

**Detention Maintenance, Ownership and Access:** The Metro District for Forest Lakes will own and maintain Detention Facility A, B and C. Access to the pond will be provided per the current El Paso County Criteria and UDFCD criteria. An El Paso County Detention Pond Maintenance Agreement will be required indicating these Facilities to be ultimately owned and maintained by the Metro District.

## **DRAINAGE AND BRIDGE FEES**

Forest Lakes Phase 2 is to be platted in the future and is within the Beaver Creek Miscellaneous Drainage Basin. The fees in place at the time of platting will be calculated within future Final Drainage Reports.

Existing Drainage Fee credits will be utilized to offset portions of the required fees due for these two filings, as to be defined in future Final Drainage Reports. Multiple plats are anticipated for this Phase 2 area.

## **SUMMARY**

Developed runoff from the proposed Forest Lakes Phase 2 are proposed to outfall to three proposed public storm systems serving three separate detention/water quality facilities (owned and maintained by the Forest Lakes Metropolitan District) prior to discharging to downstream facilities. The proposed Full Spectrum detention/water quality ponds were sized using the current and applicable drainage criteria and provide release rates below existing allowable release rates and therefore the proposed development does not overburden downstream facilities. Future Final Drainage Reports will further define and provide additional analysis for all on-site storm facilities as the project moves forward.

 Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: El Paso County Area, Colorado  
 Survey Area Data: Version 15, Oct 10, 2017

Soil Survey Area: Pike National Forest, Eastern Part, Colorado, Parts of Douglas, El Paso, Jefferson, and Teller Counties  
 Survey Area Data: Version 4, Oct 12, 2017

Your area of interest (AOI) includes more than one soil survey area. These survey areas may have been mapped at different scales, with a different land use in mind, at different times, or at different levels of detail. This may result in map unit symbols, soil properties, and interpretations that do not completely agree across soil survey area boundaries.

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Feb 22, 2014—Mar 9, 2017

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

## Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

**Group A.** Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

**Group B.** Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

**Group C.** Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

**Group D.** Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

**DETENTION BASIN STAGE-STORAGE TABLE BUILDER**

UD-Detention, Version 3.07 (February 2017)

# Detention Basin Outlet Structure Design

UD-Detention, Version 3.07 (February 2017)

	Stage (ft)	Zone Volume (ac-ft)	Outlet Type
Zone 1 (WQCV)	2.31	0.289	Orifice Plate
Zone 2 (EURV)	3.15	0.335	Orifice Plate
Zone 3 (100-year)	5.00	0.871	Weir&Pipe (Restrict)
		1.495	Total

**User Input: Orifice at Underdrain Outlet (typically used to drain WQCV in a Filtration BMP)**

Underdrain Orifice Invert Depth =	N/A	ft (distance below the filtration media surface)
Underdrain Orifice Diameter =	N/A	inches

**Calculated Parameters for Underdrain**

Underdrain Orifice Area =	N/A	ft <sup>2</sup>
Underdrain Orifice Centroid =	N/A	feet

**User Input: Orifice Plate with one or more orifices or Elliptical Slot Weir (typically used to drain WQCV and/or EURV in a sedimentation BMP)**

Invert of Lowest Orifice =	0.00	ft (relative to basin bottom at Stage = 0 ft)
Depth at top of Zone using Orifice Plate =	4.00	ft (relative to basin bottom at Stage = 0 ft)
Orifice Plate: Orifice Vertical Spacing =	12.00	inches
Orifice Plate: Orifice Area per Row =	N/A	inches

**Calculated Parameters for Plate**

WQ Orifice Area per Row =	N/A	ft <sup>2</sup>
Elliptical Half-Width =	N/A	feet
f =	N/A	feet
g =	N/A	ft <sup>2</sup>

**User Input: Stage and Total Area of Each Orifice Row (numbered from lowest to highest)**

	Row 1 (required)	Row 2 (optional)	Row 3 (optional)	Row 4 (optional)	Row 5 (optional)	Row 6 (optional)	Row 7 (optional)	Row 8 (optional)
Stage of Orifice Centroid (ft)	0.00	1.00	2.00					
Orifice Area (sq. inches)	0.88	1.25	2.25					
Row 9 (optional)								
Row 10 (optional)								
Row 11 (optional)								
Row 12 (optional)								
Row 13 (optional)								
Row 14 (optional)								
Row 15 (optional)								
Row 16 (optional)								

Revise. UDFCD recommends three orifices to maximize the diameter. Comment applies to all proposed ponds.

**User Input: Vertical Orifice (Circular or Rectangular)**

	Not Selected	Not Selected	
Invert of Vertical Orifice =	N/A	N/A	ft (relative to basin bottom at Stage = 0 ft)
Depth at top of Zone using Vertical Orifice =	N/A	N/A	ft (relative to basin bottom at Stage = 0 ft)
Vertical Orifice Diameter =	N/A	N/A	inches

**Calculated Parameters for Vertical Orifice**

	Not Selected	Not Selected	
Vertical Orifice Area =	N/A	N/A	ft <sup>2</sup>
Vertical Orifice Centroid =	N/A	N/A	feet

**User Input: Overflow Weir (Dropbox) and Grate (Flat or Sloped)**

	Zone 3 Weir	Not Selected	
Overflow Weir Front Edge Height, H <sub>o</sub> =	4.00	N/A	ft (relative to basin bottom at Stage = 0 ft)
Overflow Weir Front Edge Length =	6.00	N/A	feet
Overflow Weir Slope =	0.00	N/A	H:V (enter zero for flat grate)
Horiz. Length of Weir Sides =	4.00	N/A	feet
Overflow Grate Open Area % =	70%	N/A	% grate open area/total area
Debris Clogging % =	50%	N/A	%

**Calculated Parameters for Overflow Weir**

	Zone 3 Weir	Not Selected	
Height of Grate Upper Edge, H <sub>g</sub> =	4.00	N/A	feet
Over Flow Weir Slope Length =	4.00	N/A	feet
Grate Open Area / 100-yr Orifice Area =	3.42	N/A	should be ≥ 4
Overflow Grate Open Area w/o Debris =	16.80	N/A	ft <sup>2</sup>
Overflow Grate Open Area w/ Debris =	8.40	N/A	ft <sup>2</sup>

**User Input: Outlet Pipe w/ Flow Restriction Plate (Circular Orifice, Restrictor Plate, or Rectangular Orifice)**

	Zone 3 Restrictor	Not Selected	
Depth to Invert of Outlet Pipe =	2.50	N/A	ft (distance below basin bottom at Stage = 0 ft)
Outlet Pipe Diameter =	30.00	N/A	inches
Restrictor Plate Height Above Pipe Invert =	30.00	N/A	inches

**Calculated Parameters for Outlet Pipe w/ Flow Restriction Plate**

	Zone 3 Restrictor	Not Selected	
Outlet Orifice Area =	4.91	N/A	ft <sup>2</sup>
Outlet Orifice Centroid =	1.25	N/A	feet
Half-Central Angle of Restrictor Plate on Pipe =	3.14	N/A	radians

**User Input: Emergency Spillway (Rectangular or Trapezoidal)**

Spillway Invert Stage =	5.50	feet
Spillway Crest Length =	75.0	feet
Spillway End Slopes =	4.00	feet
Freeboard above Max Water Surface =	1.00	feet

Per UDFCD "The maximum allowable 100-yr release rate for a full spectrum detention facility is equal to 90 percent of the predevelopment discharge for the upstream watershed." (Ch 12, Section 4.1.2) Comment applies to all proposed ponds.

UD-Detention, Version 3.07 (February 2017)

# Detention Basin Outlet Structure Design

UD-Detention, Version 3.07 (February 2017)

Project: FOREST LAKES PHASE 2  
Basin ID: POND B

	Stage (ft)	Zone Volume (ac-ft)	Outlet Type
Zone 1 (WQCV)	2.44	0.499	Orifice Plate
Zone 2 (EURV)	3.21	0.578	Orifice Plate
Zone 3 (100-year)	5.00	1.505	Weir & Pipe (Restrict)
		2.582	Total

User Input: Orifice at Underdrain Outlet (typically used to drain WQCV in a Filtration BMP)

Underdrain Orifice Invert Depth =	N/A	ft (distance below the filtration media surface)
Underdrain Orifice Diameter =	N/A	inches

Calculated Parameters for Underdrain

Underdrain Orifice Area =	N/A	ft <sup>2</sup>
Underdrain Orifice Centroid =	N/A	feet

User Input: Orifice Plate with one or more orifices or Elliptical Slot Weir (typically used to drain WQCV and/or EURV in a sedimentation BMP)

Invert of Lowest Orifice =	0.00	ft (relative to basin bottom at Stage = 0 ft)
Depth at top of Zone using Orifice Plate =	3.75	ft (relative to basin bottom at Stage = 0 ft)
Orifice Plate: Orifice Vertical Spacing =	11.25	inches
Orifice Plate: Orifice Area per Row =	N/A	inches

Calculated Parameters for Plate

WQ Orifice Area per Row =	N/A	ft <sup>2</sup>
Elliptical Half-Width =	N/A	feet
Elliptical Slot Centroid =	N/A	feet
Elliptical Slot Area =	N/A	ft <sup>2</sup>

User Input: Stage and Total Area of Each Orifice Row (numbered from lowest to highest)

	Row 1 (required)	Row 2 (optional)	Row 3 (optional)	Row 4 (optional)	Row 5 (optional)	Row 6 (optional)	Row 7 (optional)	Row 8 (optional)
Stage of Orifice Centroid (ft)	0.00	0.90	1.80	2.70	3.60			
Orifice Area (sq. inches)	0.88	2.25	4.00	3.00				
	Row 9 (optional)	Row 10 (optional)	Row 11 (optional)	Row 12 (optional)	Row 13 (optional)	Row 14 (optional)	Row 15 (optional)	Row 16 (optional)
Stage of Orifice Centroid (ft)								
Orifice Area (sq. inches)								

User Input: Vertical Orifice (Circular or Rectangular)

	Not Selected	Not Selected	
Invert of Vertical Orifice =	N/A	N/A	ft (relative to basin bottom at Stage = 0 ft)
Depth at top of Zone using Vertical Orifice =	N/A	N/A	ft (relative to basin bottom at Stage = 0 ft)
Vertical Orifice Diameter =	N/A	N/A	inches

Calculated Parameters for Vertical Orifice

	Not Selected	Not Selected	
Vertical Orifice Area =	N/A	N/A	ft <sup>2</sup>
Vertical Orifice Centroid =	N/A	N/A	feet

User Input: Overflow Weir (Dropbox) and Grate (Flat or Sloped)

	Zone 3 Weir	Not Selected	
Overflow Weir Front Edge Height, H <sub>o</sub> =	3.75	N/A	ft (relative to basin bottom at Stage = 0 ft)
Overflow Weir Front Edge Length =	8.00	N/A	feet
Overflow Weir Slope =	0.00	N/A	H:V (enter zero for flat grate)
Horiz. Length of Weir Sides =	4.00	N/A	feet
Overflow Grate Open Area % =	85%	N/A	% grate open area/total area
Debris Clogging % =	50%	N/A	%

Calculated Parameters for Overflow Weir

	Zone 3 Weir	Not Selected	
Height of Grate Upper Edge, H <sub>1</sub> =	3.75	N/A	feet
Over Flow Weir Slope Length =	4.00	N/A	feet
Grate Open Area / 100-yr Orifice Area =	3.85	N/A	should be ≥ 4
Overflow Grate Open Area w/o Debris =	27.20	N/A	ft <sup>2</sup>
Overflow Grate Open Area w/ Debris =	13.60	N/A	ft <sup>2</sup>

User Input: Outlet Pipe w/ Flow Restriction Plate (Circular Orifice, Restrictor Plate, or Rectangular Orifice)

	Zone 3 Restrictor	Not Selected	
Depth to Invert of Outlet Pipe =	2.50	N/A	ft (distance below basin bottom at Stage = 0 ft)
Outlet Pipe Diameter =	36.00	N/A	inches
Restrictor Plate Height Above Pipe Invert =	36.00	N/A	inches

Calculated Parameters for Outlet Pipe w/ Flow Restriction Plate

	Zone 3 Restrictor	Not Selected	
Outlet Orifice Area =	7.07	N/A	ft <sup>2</sup>
Outlet Orifice Centroid =	1.50	N/A	feet
Angle of Restrictor Plate on Pipe =	3.14	N/A	radians

User Input: Emergency Spillway (Rectangular or Trapezoidal)

Spillway Invert Stage =		ft (relative to basin bottom at Stage = 0 ft)
Spillway Crest Length =		feet
Spillway End Slopes =		H:V
Freeboard above Max Water Surface =		feet

Calculated Parameters for Spillway

Spillway Design Flow Depth =		feet
Stage at Top of Freeboard =		feet
Basin Area at Top of Freeboard =		acres

Is there erosion potential from this point source to South Beaver Creek? Erosion protection may need to be extended to Beaver Creek.

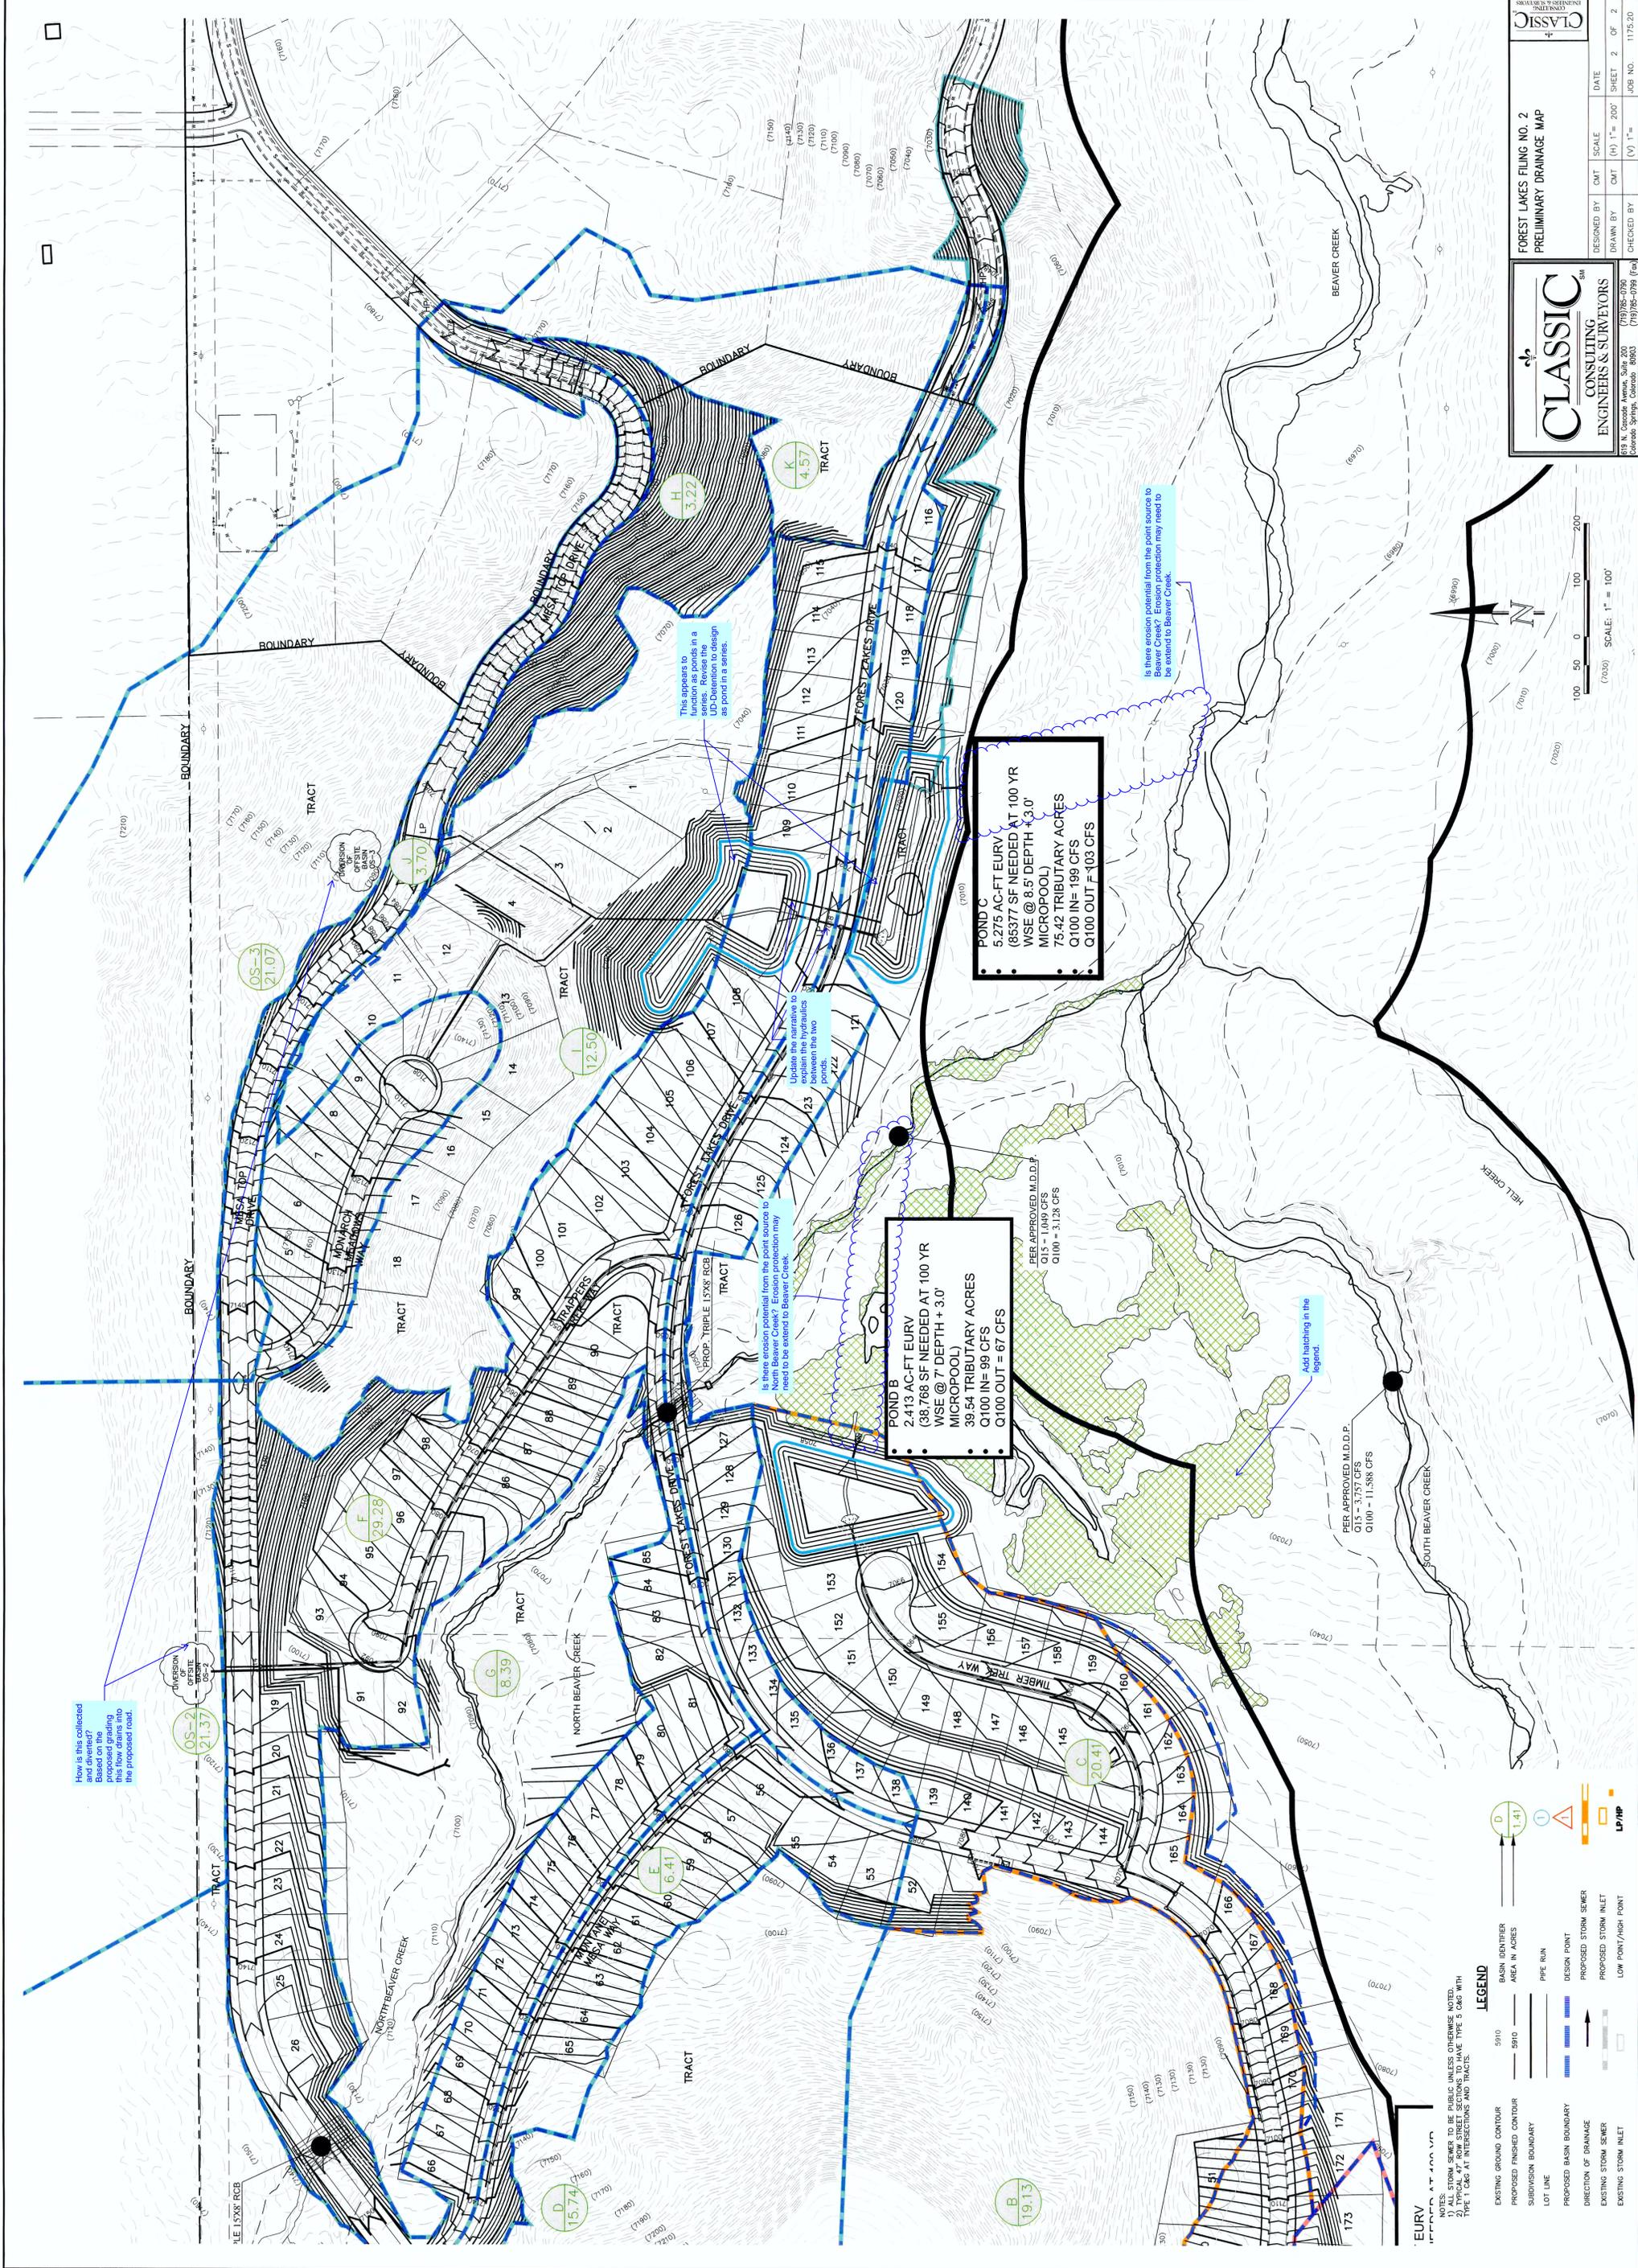

Low point of diversion. Where does this go?

Show how the OS-1 diversion continues to South Beaver Creek.
