MASTER DEVELOPMENT DRAINAGE PLAN AMENDMENT AND PRELIMINARY DRAINAGE REPORT FOR FOREST LAKES (FIL. 5, 6, & 7)

ENGINEER'S STATEMENT:

The attached drainage plan and report were prepared under my direction and supervision and are correct to the best of my knowledge and belief. Said drainage report has been prepared according to the criteria established by the El Paso County for drainage reports and said report is in conformity with the master plan of the drainage basin. I accept responsibility for any liability caused by any negligent acts, errors, or omissions on my part in preparing this report.

Kyle R Campbell, Colorado P.E. #29794

Date

DEVELOPER'S STATEMENT:

I, the developer, have read and will comply with all of the requirements specified in this drainage report and plan.

Business Name: Forest Lakes Residential Development, LLC

By: _____

Title: _____

Address: 6385 Corporate Drive, Suite 200

Colorado Springs, CO 80919

EL PASO COUNTY ONLY:

Filed in accordance with the requirements of the Drainage Criteria Manual, Volumes 1 and 2, El Paso County Engineering Criteria Manual and Land Development Code as amended.

Jennifer Irvine, P.E.

MASTER DEVELOPMENT DRAINAGE PLAN AMENDMENT AND PRELIMINARY DRAINAGE REPORT FOR FOREST LAKES (FIL. 5, 6, & 7)

PURPOSE

This document is the Master Development Drainage Plan Amendment and Preliminary Drainage Report for Forest Lakes (Filings 5, 6, & 7). The purpose of this report is to identify general onsite and offsite drainage patterns, storm sewer corridors and areas tributary to the site, and to safely route developed storm water runoff to adequate treatment and outfall facilities. Based upon the revisions to the Filings 5, 6, & 7 site layout. The proposed Filings 5, 6, & 7 development shall be in adherence to the El Paso County approved Master Development Drainage Plan for Forest Lakes as well as current County Drainage Criteria.

PROJECT DESCRIPTION

The Forest Lakes development is a phased master planned community located in northern El Paso County, Colorado. The master planned land includes areas of open space, residential, trails, drainage, preservation and two water supply reservoirs. The property lies to the east of Pike National Forest, north of the United States Air Force Academy, west of Interstate 25 and south of the Town of Monument. The Forest Lakes property is located in portions of Sections 27, 28, 29 and 33 of Township 11 South, Range 67 West of the Sixth Principal Meridian and covers approximately 900 acres. The proposed amendment area (Filings 5, 6, & 7) is the far westerly area east of Filing 1 and is comprised of 287 acres. Watersheds that impact the Filings 5, 6, & 7 property include Beaver Creek, Hell Creek and North Beaver Creek. These watersheds are tributary to Monument Creek. Monument Creek itself passes along the eastern boundary of the overall Forest Lakes property in a north to south direction. The purpose of the amended Master Development Drainage Plan analysis is to provide existing and updated developed peak flow data for the 5-year and 100-year recurrence intervals within the Filings 5, 6, & 7 portion of the property. This information has been used to develop overall drainage design information and to identify the required storm drainage and flood control facilities within the Filings 5, 6, & 7 property. The vicinity map for the Filings 5, 6, & 7 Amendment area is presented in the Appendix of this report.

The initial approved Master Development Drainage Plan titled, "Forest Lakes Master Development Drainage Plan", was approved by Kiowa Engineering Corporation and dated April 11, 2002. The following is an excerpt from that report:

"The hydrology analysis for the initially approved Forest Lakes Master Development Drainage Plan was completed in three phases. The first phase is a regional hydrologic analysis. The regional hydrology model uses an elliptical rainfall distribution patterns based upon Hydromet 52. The regional analysis was conducted in order to assess the development's overall impact upon peak

discharges within Monument Creek as it passes in Forest Lakes development. The hydrology development in the Monument Creek Drainage Basin Planning Study (DBPS) was utilized as a basis for the regional analysis. The existing and developed basin hydrologic conditions were analyzed. The second phase was a localized hydrologic analysis that focused upon determining the peak discharges along the major drainageways within the property. For this phase, a Type II storm pattern was assumed over the drainage basins associated with the Forest Lakes development. This analysis was developed in order to provide information in use in modeling floodplains and sizing of major drainageway facilities. The third phase was an on-site developed condition hydrologic analysis, using the Rational Method to determine the peak flows within the property to size and locate on site hydraulic structures.”

For this Filings 5, 6, & 7 Amendment, detailed analysis of initial/local systems will be deferred to the future final drainage reports when platting is proposed.

Presented on Exhibit A (map from initial MDDP in appendix) is information for the major sub-watershed information that impact the Forest Lakes property, including Hell Creek, Beaver Creek and North Beaver Creek. The sub-watersheds shown on Exhibit A were used in the hydrologic analysis for the regional and localized hydrologic analysis described above. Beaver Creek courses through the center of the Forest Lakes Development from west to east. The most significant feature within the Beaver Creek watershed is Bristlecone Lake and Pinon Lake which are not affected by this Filings 5, 6, & 7 Amendment. These lakes and their embankments were constructed in 1986 as water supply reservoirs.

The site is located within the Beaver Creek Drainage Basin.

PREVIOUS REPORTS

Several studies were reviewed in the preparation of the initial Master Development Drainage Plan and this Filings 5, 6, & 7 Amendment. These studies include:

1. Master Plan Level Geologic Hazards Evaluation and Preliminary Geotechnical Investigation, Forest Lakes Master Development Plan, prepared by CTL/Thompson, Inc. dated July 31, 2001.
2. Forest Lakes Master Development Drainage Plan, prepared by Kiowa Engineering Corporation dated April 11, 2002.
3. City of Colorado Springs and El Paso County Flood Insurance Study, prepared by Federal Emergency Management Agency, dated Marcy 1997.

4. City of Colorado Springs Drainage Criteria Manual Volume 1, May 2014.
5. Drainage Criteria Manual (Volume 3) latest revision April 2008, Urban Drainage and Flood Criteria District.
6. Baseline Hydrology Study, Monument Creek Drainage Basin Planning Study, prepared by CH2M Hill, Inc. and Kiowa Engineering Corporation dated May 1992.
7. Forest Lakes Master Drainage Plan and Phase 1 Drainage Report, prepared by KKBNA, Inc. dated November 1986.
8. Procedures for Determining Peak Flows in Colorado, Incorporates and Supplements Technical Release No. 55, prepared by Soil Conservation Service, dated March 1980.

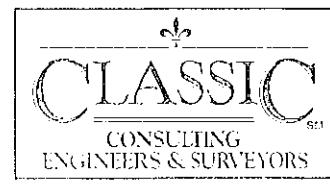

The Forest Lakes Master Development Drainage Plan (MDDP) dated November 1986, was prepared as a part of the planning for the property which originally began in 1986. This MDDP (1986) was prepared using the City/County drainage criteria that were in affect at the time. Peak flow data was developed for the watersheds that pass through the property. Drainageway improvements, detention basin plans and roadway crossing sizes were developed for the proposed development condition for the initially developed areas.

SOILS AND GEOLOGY

Soils within the watersheds that are tributary to the Forest Lakes property vary between soil types A through D, as identified by the U.S. Department of Agriculture, Soil Conservation Service. Soils are classified in hydrologic groups A, B, C, and D according to their infiltration capacity. Type D soils are dominant in the forested areas west of Monument Creek. These soils are generally associated with the Pikes Peak Granite found in the region. This is particularly true for the forested portion of the Beaver Creek watershed. The decomposed granite soils exhibit extremely high rates of runoff and are very susceptible to erosion and sedimentation. Hydrologic Soils Group A soils consist chiefly of well-drained sand and gravel and have a low runoff potential. The soils within the Forest Lakes property are predominantly soil type B. See Appendix for additional information.

DRAINAGE CRITERIA

The hydrology for the major sub-watersheds (i.e., Beaver Creek), were estimated using the methods outlined in the initial Master Development Drainage Plan. Exhibit A presents the major sub-watersheds that impact the Forest Lakes property. All updated calculations for the Filings 5, 6, & 7 Amendment area were performed using the following:

Hydrologic calculations were performed using the City of Colorado Springs/El Paso County Drainage Criteria Manual, as revised in November 1991 and October 1994. Stormwater quality analysis and Extended Detention Basin (EDB) design are per the Urban Drainage and Flood Control District Manual and UD-BMP Version 3.01 spreadsheet. The Preliminary drainage calculations within this report use the Rational Method to estimate stormwater runoff to the three pond locations. Future Final Drainage Report(s) will provide a more detailed basin breakdown and utilize this runoff method to calculate the runoff to each inlets and storm sewer pipes. Also, the future Final Drainage Reports will provide the final design for each of the three full spectrum detention and water quality facilities and detailed IRF calculations/exhibits to support the tributary impervious values used.

FLOODPLAIN STATEMENT

A portion of this site is located within a floodplain as determined by the Flood Insurance Rate Maps (F.I.R.M.) Map Numbers 08041 C0267G, CO266G, CO258G, & CO259G effective date, December 7, 2018 (See Appendix for overlay exhibit). No proposed development is anticipated to take place within the floodplain other than one proposed roadway crossing as reflected on the drainage maps.

EXISTING MAJOR DRAINAGEWAYS

Three major drainageways flow onto the Forest Lakes site, including North Beaver Creek, South Beaver Creek and Hell Creek. Hell Creek, North and South Beaver Creek converge in the western portion of the site to form Beaver Creek. Beaver Creek continues through the site on an easterly course through Bristle Cone Lake over the reservoir spillway. The drainageways are well defined and heavily vegetated. The bottom width of the drainageways range from 5-feet in the smaller Hell Creek to 10-feet in the larger Beaver Creek.

The intent of the Filings 5, 6, & 7 site development is to leave the major drainageways in their existing form to the greatest practical extent possible. Developed runoff is routed to the three full spectrum detention and water quality facilities prior to releasing into these downstream channels. The original MDDP provided channel hydraulic analysis and determined with the use of full spectrum detention for the developed runoff, there are no channel improvements required. Therefore, there is no need for any additional hydraulic studies within these channels. Minimal disturbance only to the fringe of the wetland areas is proposed, no mouse area disturbance is anticipated. Proper permitting for the wetlands disturbance will be in place prior to any construction.

One road crossing of the existing drainageway is planned with Filings 5, 6, & 7. This crossing will be along North Beaver Creek upstream of the confluence between North and South Beaver Creek. The proposed culverts under the road crossings along North Beaver Creek have been designed to convey the 100-year Bulk Stream Flow (debris flow rate) from the CTL Thompson study of 4,130 cfs. A full hydraulic analysis will be completed with the Final Drainage Report and will meet the allowable bridge clearance criteria of at least 2 feet of freeboard between the box culvert ceiling and 100-yr water surface elevation. Per the CTL Thompson 'Debris Flow Report', we will work with the original HEC-RAS model to properly design this culvert to pass the entire debris flow rate.

PROPOSED DRAINAGE CONDITIONS

As reflected in the approved Kiowa MDDP, the site is influenced by off-site tributary flows from the west and north. Also, as reflected in the MDDP, on-site full spectrum detention and water quality facilities will detain and treat the developed runoff from the proposed site prior to releasing at or below historic rates to the downstream channels. As previously mentioned, the rational method was used to estimate developed runoff values. Appropriate peak runoff calculations have been used and will be verified with the future final drainage reports.

DESIGN POINT 1 ($Q_5 = 54.8 \text{ cfs}$ and $Q_{100} = 132.2 \text{ cfs}$) is the developed runoff from the proposed single family development, Basin A, 37.55 acres. This runoff is collected in a public storm sewer system and routed to the proposed Full Spectrum Detention and Storm Water Quality Facility – Pond A. This facility in an extended detention basin (EDB) per the current drainage criteria and UDFCD (Urban Drainage Flood Control District) standards. A composite impervious value was determined using the Site-Level Low Impact Development (LID) Design Effective Impervious Calculator (IRF Form) located in the Appendix of this report. With the tributary area of 37.55 acres and a calculated 41.4% imperviousness, the total required Excess Urban Runoff Volume (EURV) is 1.642 Ac.-ft. A future Final Drainage Report will provide the detailed breakdown used on the IRF form and exact tributary imperviousness value for each pond.

Impact structures or other means or energy dissipation will be provided at all pipe daylight point into and out of the proposed ponds and bypass storm systems. Final pond design, outlet structure sizing, trickle channel and forebay details will be included with final construction drawings for review and approval by El Paso County prior to construction approval. The EURV design of this pond ensures that all discharges (2, 5, 10, 25, 50 and 100 year) will be released at or below historic release rates. Two preliminary pond sizing forms (UD-Detention v.3.07 & EDB Design Procedure Form) are included in the Appendix of this report and show the following outlet box features in order to maintain release rates at or below historic levels:

4' wide by 4' deep outlet box

4" initial surcharge volume, 350 square feet, 2.5' deep micropool (bottom = 7105.50)

Bottom of pond/top of Micropool = 7108.00

EURV = Top of Box = 7114.00 Required EURV = 1.642 ac.-ft. Provided EURV = 1.83 ac.-ft.

- (3) orifice holes -**
- 3 square inch bottom hole (1" x 3")**
 - 4 square inch middle hole (2" x 2")**
 - 4 square inch top hole (2" x 2")**

30" RCP outlet pipe at invert out = 7107.80

45° length emergency spillway at 7117.00, Top of pond berm elevation = 7120.00, 12' wide minimum width.

Using an equivalent undeveloped area of land, Basin EX-A of 37.55 acres, a historic release rate and thus an allowable release rate for Pond A is $Q_5 = 12.1$ cfs and $Q_{100} = 80.9$ cfs. Per the UD-Detention form, the restricted release rate from the facility is $Q_5 = 0.67$ cfs and $Q_{100} = 52.1$ cfs with a 100-year water surface elevation in the pond of 7116.46. Final pond design and release rates will be finalized with the final drainage report for the proposed subdivision.

DESIGN POINT 2 ($Q_5 = 22.0$ cfs and $Q_{100} = 147.5$ cfs) is the historic undeveloped runoff from the off-site Basin OS-1, 77.01 acres of adjacent national forest. This runoff sheet flows east directly toward the proposed lots and cul-de-sac roadways. A series of CDOT Type C grate inlets will be installed along the eastern edge of Basin OS-1, behind the lots to intercept this historic runoff prior to draining into the proposed development. A bypass or diversion pipe system will be installed from these grated inlets to the south and into the proposed development but this pipe will not connect with the proposed development runoff and Pond A tributary storm pipe. Swales and berthing will be installed to route this historic runoff to the grated inlets. In the event of inlet clogging the overflow path will be down the shared lot line swales of the adjacent home lots. Riprap or concrete 'V'-notched swales will be installed along these shared lot lines when the proposed home lots back up to the significant hill side throughout the property. Maintenance of these grated inlets and diversion storm pipe system is by the Forest Lakes Metro District. Energy dissipation of this historic runoff will be provided at the exit point of this bypass main into the South Beaver Creek corridor. Future final drainage reports will discuss erosion protection and adequate downstream corridors from all pipe release points to the existing channels.

DESIGN POINT 3 ($Q_5 = 23.7$ cfs and $Q_{100} = 186.5$ cfs) is the combined runoff from the historic bypass of Design Point 2 and the release rate of Pond A into the South Beaver Creek mouse limits. The historic release rate into South

Beaver Creek from this portion of the development is $Q_5 = 32.7$ cfs and $Q_{100} = 219.5$ cfs. Therefore, the proposed development will not hinder the downstream corridor as the flow rates are less than in the existing conditions.

DESIGN POINT 4 ($Q_5 = 64.1$ cfs and $Q_{100} = 176.0$ cfs) is the developed runoff from the proposed single family development and existing open space area, Basin B, 59.94 acres. This runoff is collected in a public storm sewer system and routed to the proposed Full Spectrum Detention and Storm Water Quality Facility – Pond B. This facility is an extended detention basin (EDB) per the current drainage criteria and UDFCD (Urban Drainage Flood Control District) standards. A Preliminary composite impervious value was determined using the Site-Level Low Impact Development (LID) Design Effective Impervious Calculator (IRF Form) located in the Appendix of this report. With the tributary area of 59.94 acres and a calculated 28.8% imperviousness, the total required Excess Urban Runoff Volume (EURV) is 1.771 Ac.-ft. A future Final Drainage Report will provide the detailed breakdown used on the IRF form and exact tributary imperviousness value for each pond.

Impact structures or other means or energy dissipation will be provided at all pipe daylight point into and out of the proposed ponds and bypass storm systems. Final pond design, outlet structure sizing, trickle channel and forebay details will be included with final construction drawings for review and approval by El Paso County prior to construction approval. The EURV design of this pond ensures that all discharges (2, 5, 10, 25, 50 and 100 year) will be released at or below historic release. Two preliminary pond sizing forms (UD-Detention v.3.07 & EDB Design Procedure Form) are included in the Appendix of this report and show the following outlet box features in order to maintain release rates at or below historic levels:

6' wide by 4' deep outlet box

5" initial surcharge volume, 350 square feet, 2.5' deep micropool (bottom = 7049.50)

Bottom of pond/top of Micropool = 7054.00

EURV = Top of Box = 7059.80 Required EURV = 1.771 ac.-ft. Provided EURV = 1.92 ac.-ft.

- (3) orifice holes -**
- 4 square inch bottom hole (2" x 2")**
 - 8 square inch middle hole (4" x 2")**
 - 12 square inch top hole (4" x 3")**

30" RCP outlet pipe at invert out = 7051.80

50' length emergency spillway at 7063.00, Top of pond berm elevation = 7066.00, 12' wide minimum width.

Using an equivalent undeveloped area of land, Basin EX-B of 37.55 acres, a historic release rate and thus an allowable release rate for Pond B is $Q_5 = 18.7$ cfs and $Q_{100} = 125.6$ cfs. Per the UD-Detention form, the restricted release rate

from the facility is $Q_5 = 1.3$ cfs and $Q_{100} = 84.2$ cfs with a 100-year water surface elevation in the pond of 7062.75. Final pond design and release rates will be finalized with the final drainage report for the proposed subdivision.

DESIGN POINT 5 ($Q_5 = 1441$ cfs and $Q_{100} = 4130$ cfs) is the interpolated historic flow rate within North Beaver Creek channel from the referenced CTL Thompson Debris Flow report. This runoff rate is much higher than the MDDP 100-year rate of 2,950 cfs. The purpose of including this design point and basin in this analysis is to show that the runoff rate in South Beaver Creek is less with the installation of the proposed three detention facilities for the developed runoff. This historic runoff stays within the established North Beaver Creek corridor and continues south-east into the proposed development toward Design Point 6.

DESIGN POINT 6 ($Q_5 = 1433$ cfs and $Q_{100} = 4116$ cfs) is the flow rate within North Beaver Creek channel from DP-5 and Basin D, 24.98 acres of onsite property mostly comprised of open space/undeveloped area. At this location is a proposed roadway crossing (Mesa Top Drive) and (3) single cell box culverts (8' high x 15' wide @ 0.50% grade) to convey this runoff to the south and Design Point 9. A UD-Culvert v.3.04 from UDFCD (located in the Appendix) was used to preliminarily estimate the headwater depth and provide riprap energy dissipation calculations; Type M riprap, 80' length of protection and 63' wide. Preliminary box culvert sizing was also completed using the Bentley FlowMaster program, results included in the Appendix and include a velocity less than 20 ft/sec and normal depth less of 4.63'. The inside of the box culvert is 8' high, therefore there is 3.37' of freeboard over the debris flow rate within the box culvert. As previously mentioned, a full hydraulic analysis will be completed with the Final Drainage Report and in conjunction with CTL Thompson and the IIEC-RAS channel model. This runoff continues south to Design Point 9.

DESIGN POINT 7 ($Q_5 = 9.8$ cfs and $Q_{100} = 66.1$ cfs) is the runoff generated from off-site Basin OS-3, 10.31 acres of existing large lot single family homes and undeveloped land to the north, and onsite Basin F, 16.61 acres of 2 large home lots (over 5 acre lots). The majority of these lots will remain undeveloped except for the driveway and actual home footprint, and as these lots are over 5 acres in size, detention and water quality is not required. Therefore, multiple grated inlets will intercept this runoff and a diversion/bypass pipe will route the runoff to the south-west along Mesa Top Drive and directly discharging into North Beaver Creek. Design Point 8 also contains bypass runoff and connects to this system prior to discharging into the creek. As with all proposed storm sewer, these grated inlets and diversion pipe will be owned and maintained by the Forest Lakes Metro District.

DESIGN POINT 8 ($Q_5 = 8.7$ cfs and $Q_{100} = 58.2$ cfs) is the runoff generated from off-site Basin OS-2, 19.91 acres of existing large lot single family homes and undeveloped land to the north, and onsite Basin E, 8.96 acres of 2 large home lots (over 5 acre lots). The majority of these lots will remain undeveloped except for the driveway and actual home footprint, and as these lots are over 5 acres in size, detention and water quality is not required. Therefore, multiple grated inlets will intercept this runoff and a diversion/bypass pipe will route the runoff to the south, connecting with the bypass main from Design Point 7. Energy dissipation of this historic runoff will be provided at the exit point of this bypass main into the North Beaver Creek corridor, downstream of the box culvert crossing at Design Point 6.

DESIGN POINT 9 ($Q_5 = 1440$ cfs and $Q_{100} = 4164$ cfs) is the combined flow rate within North Beaver Creek channel downstream of the proposed box culverts and discharge point from Design Points 7 & 8. This runoff continues south-east in the natural North Beaver Creek corridor where it combines with the release from Pond B at Design Point 10.

DESIGN POINT 10 ($Q_5 = 1441$ cfs and $Q_{100} = 4192$ cfs) is the runoff within North Beaver Creek channel downstream of Design Point 9 and including the restricted release rate from Pond B. The historic release rate into North Beaver Creek in the undeveloped conditions is $Q_5 = 1448$ cfs and $Q_{100} = 4216$ cfs. Therefore, the proposed development will not hinder the downstream corridor as the flow rates are less than in the existing conditions.

DESIGN POINT 11 ($Q_5 = 46.9$ cfs and $Q_{100} = 117.2$ cfs) is the developed runoff from the proposed single family development and existing open space area, Basin C, 30.28 acres. This runoff is collected in a public storm sewer system and routed to the proposed Full Spectrum Detention and Storm Water Quality Facility – Pond C. This facility in an extended detention basin (EDB) per the current drainage criteria and UDFCD (Urban Drainage Flood Control District) standards. A composite impervious value was determined using the Site-Level Low Impact Development (LID) Design Effective Impervious Calculator (IRF Form) located in the Appendix of this report. With the tributary area of 30.28 acres and a calculated 35.5% imperviousness, the total required Excess Urban Runoff Volume (EURV) is 1.121 Ac.-ft. A future Final Drainage Report will provide the detailed breakdown used on the IRF form and exact tributary imperviousness value for each pond. The emergency spillway for this facility will drain onto the proposed Forest Lakes Drive and south through the open space between Lots 27 & 28 and into Beaver Creek.

Impact structures or other means or energy dissipation will be provided at all pipe daylight point into and out of the proposed ponds and bypass storm systems. Final pond design, outlet structure sizing, trickle channel and forebay details will be included with final construction drawings for review and approval by El Paso County prior to construction

approval. The EURV design of this pond ensures that all discharges (2, 5, 10, 25, 50 and 100 year) will be released at or below historic release. Two preliminary pond sizing forms (UD-Detention v.3.07 & EDB Design Procedure Form) are included in the Appendix of this report and show the following outlet box features in order to maintain release rates at or below historic levels:

6' wide by 4' deep outlet box

4" initial surcharge volume, 350 square feet, 2.5' deep micropool (bottom = 7027.50)

Bottom of pond/top of Micropool = 7030.00

EURV = Top of Box = 7034.00 Required EURV = 1.121 ac.-ft. Provided EURV = 1.18 ac.-ft.

(3) orifice holes -

- 3 square inch bottom hole (1" x 3")**
- 3 square inch middle hole (1" x 3")**
- 6 square inch top hole (2" x 3")**

30" RCP outlet pipe at invert out = 7029.80

38' length emergency spillway at 7039.00, Top of pond berm elevation = 7042.00, 12' wide minimum width.

Using an equivalent undeveloped area of land, Basin EX-C of 37.55 acres, a historic release rate and thus an allowable release rate for Pond C is $Q_5 = 10.2 \text{ cfs}$ and $Q_{100} = 68.6 \text{ cfs}$. Per the UD-Detention form, the restricted release rate from the facility is $Q_5 = 0.55 \text{ cfs}$ and $Q_{100} = 33.5 \text{ cfs}$ with a 100-year water surface elevation in the pond of 7035.70. Final pond design and release rates will be finalized with the final drainage report for the proposed subdivision.

DESIGN POINT 12 ($Q_5 = 1442 \text{ cfs}$ and $Q_{100} = 4200 \text{ cfs}$) is the runoff within North Beaver Creek channel downstream of Design Point 10 and including the restricted release rate from Pond C. The historic release rate into North Beaver Creek in the undeveloped conditions is $Q_5 = 1452 \text{ cfs}$ and $Q_{100} = 4242 \text{ cfs}$. Therefore, the proposed development will not hinder the downstream corridor as the flow rates are less than in the existing conditions.

EURV and Stormwater Quality Capture Volume: The standard Extended Detention Basin spreadsheet has been provided in the Appendix of this report to provide sizing based upon UDFCID requirements for EURV, with a minimum drain time of 72 hours.

Detention Maintenance, Ownership and Access: The Metro District for Forest Lakes will own and maintain Detention Facility A, B and C. Access to the pond will be provided per the current El Paso County Criteria and UDFCID

criteria. An El Paso County Detention Pond Maintenance Agreement will be required indicating these Facilities to be ultimately owned and maintained by the Metro District.

DRAINAGE AND BRIDGE FEES

Forest Lakes Filings 5, 6, & 7 is to be platted in the future and is within the Beaver Creek Miscellaneous Drainage Basin. The fees in place at the time of platting will be calculated within future Final Drainage Reports.

If available, existing Drainage Fee credits will be utilized to offset portions of the required fees due for this development, as to be defined in future Final Drainage Reports. Multiple plats are anticipated for this Filings 5, 6, & 7 area.

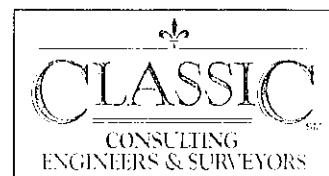

SUMMARY

Developed runoff from the proposed Forest Lakes Filings 5, 6, & 7 are proposed to outfall to three proposed public storm systems serving three separate Full Spectrum Detention and Storm Water Quality facilities (owned and maintained by the Forest Lakes Metropolitan District) prior to discharging to downstream facilities. The proposed Full Spectrum detention/water quality ponds were sized using the current and applicable drainage criteria and provide release rates below existing allowable release rates and therefore the proposed development does not overburden downstream facilities. Future Final Drainage Reports will further define and provide additional analysis for all on-site storm facilities as the project moves forward.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL:
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA NRCS certified data as of the version date(s) listed below.

Soil Survey Area: El Paso County Area, Colorado
Survey Area Data: Version 16, Sep 10, 2018

Soil Survey Area: Pike National Forest, Eastern Part, Colorado.
Parts of Douglas, El Paso, Jefferson, and Teller Counties
Survey Area Data: Version 5, Sep 10, 2018

Your area of interest (AOI) includes more than one soil survey area. These survey areas may have been mapped at different scales, with a different land use in mind, at different times, or at different levels of detail. This may result in map unit symbols, soil properties, and interpretations that do not completely agree across soil survey area boundaries.

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Jul 4, 2010—Oct 16, 2017

MAP LEGEND

MAP INFORMATION

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Hydrologic Soil Group

Map unit symbol	Map unit name	Rating	Acres in AOI	Percent of AOI
38	Jarre-Tecolote complex, 8 to 65 percent slopes	B	247.0	38.2%
65	Perrypark gravelly sandy loam, 3 to 9 percent slopes	B	33.1	5.1%
68	Peyton-Pring complex, 3 to 8 percent slopes	B	190.3	29.4%
Subtotals for Soil Survey Area			470.3	72.8%
Totals for Area of Interest			646.2	100.0%

Map unit symbol	Map unit name	Rating	Acres in AOI	Percent of AOI
2	Aquolls, 1 to 10 percent slopes	A/D	0.0	0.0%
22	Kassler very gravelly coarse sandy loam, 5 to 35 percent slopes	A	68.0	10.5%
43	Sphinx gravelly coarse sandy loam, 40 to 70 percent slopes	D	6.0	0.9%
46	Sphinx-Rock outcrop complex, 15 to 80 percent slopes	D	12.5	1.9%
47	Sphinx, warm-Rock outcrop complex, 15 to 80 percent slopes	D	75.2	11.6%
48	Tecolote very gravelly sandy loam, 15 to 40 percent slopes, very stony	B	14.1	2.2%
Subtotals for Soil Survey Area			175.8	27.2%
Totals for Area of Interest			646.2	100.0%

Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

Rating Options

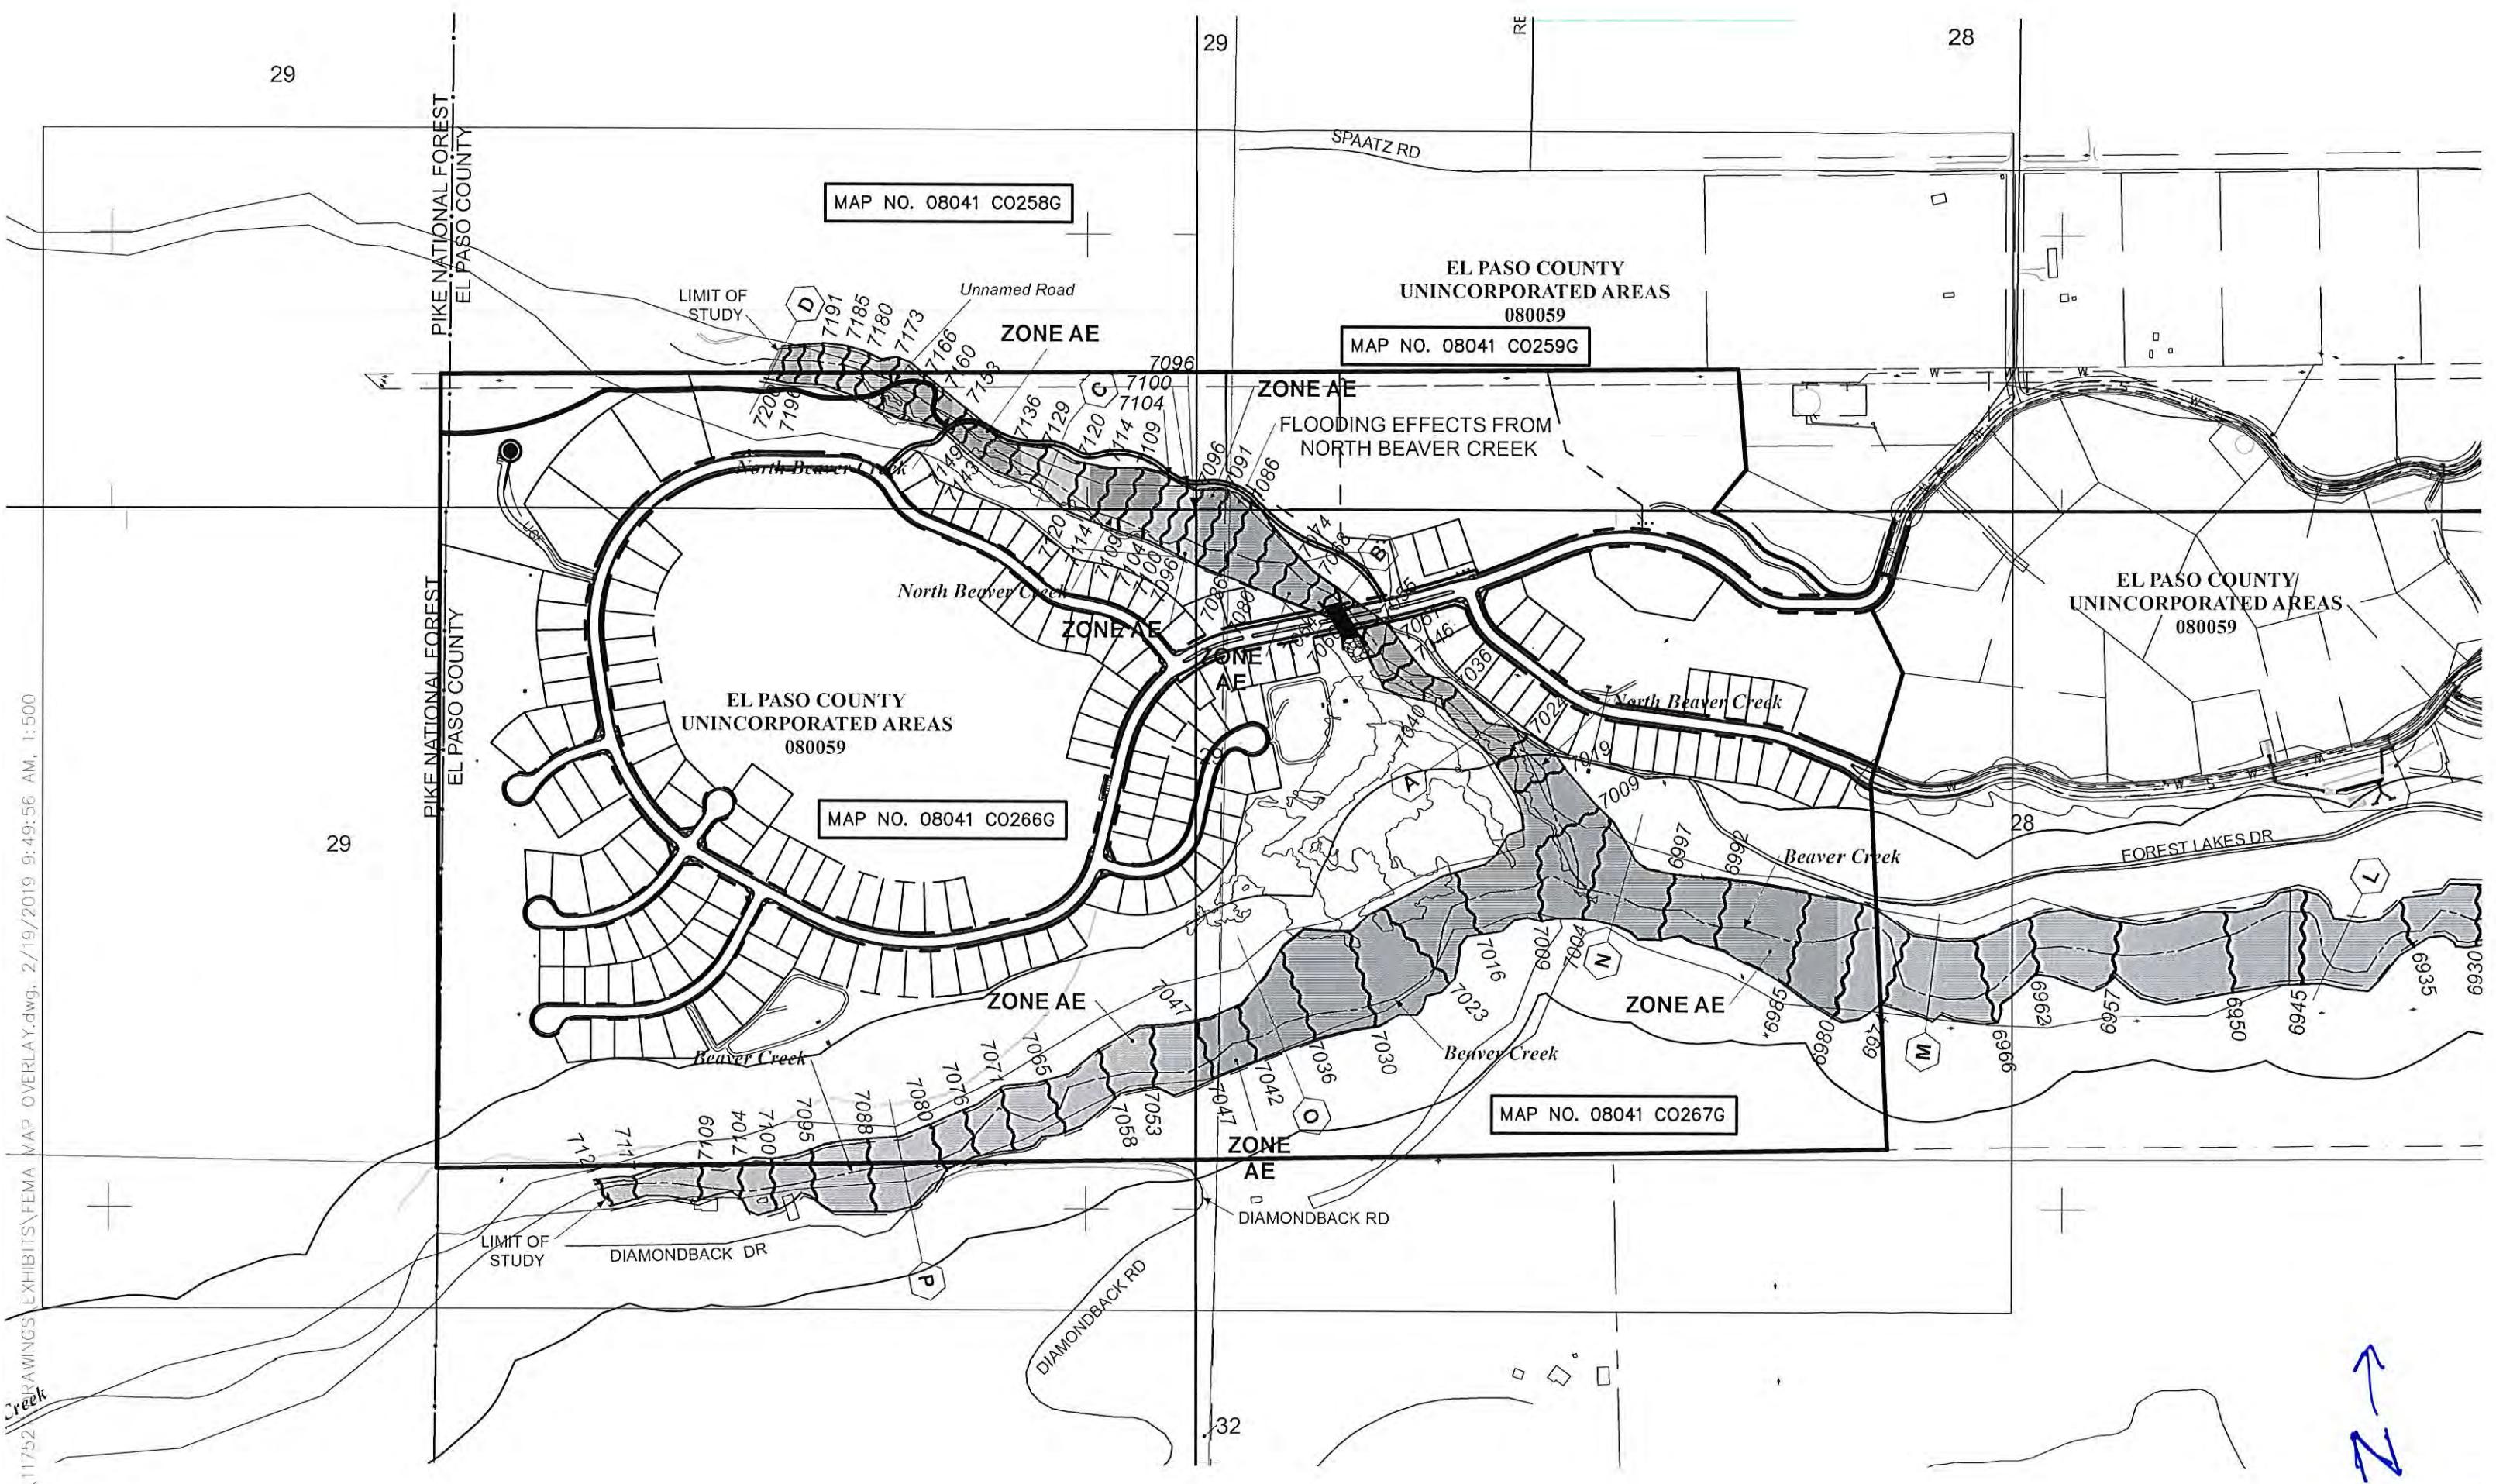

Aggregation Method: Dominant Condition

Component Percent Cutoff: None Specified

Max Infiltration Rate:

SITE INFO

CALCULATED

LID / EFFECT

Provide an exhibit showing the DCIA, UIA, RPA, SPA areas for Pond A, B, & C.

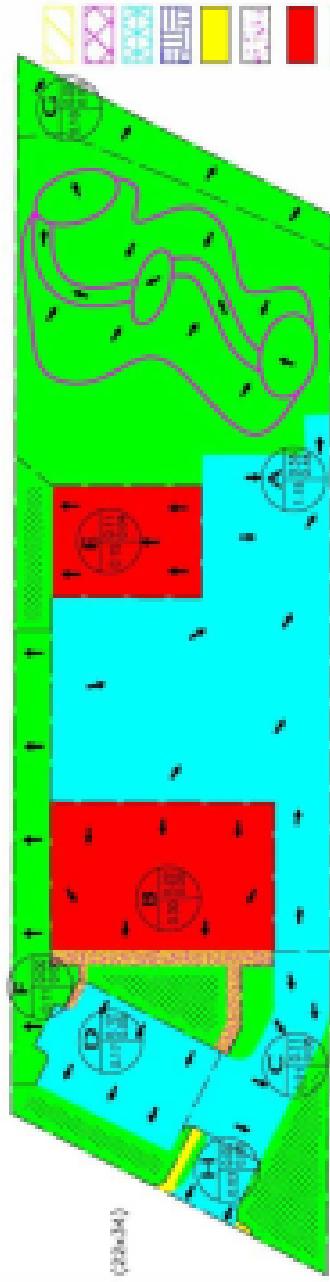

Based on the site layout a large portion of SPA does not directly drain into the pond but instead goes through the DCIA before draining into the Detention Pond. These areas upstream of the DCIA should not be counted as SPA. The only applicable SPA would be the pond area itself.

In reviewing the sub-basin, the only possible area where RPA may exist is west of the pond along the back of lots 102-106.

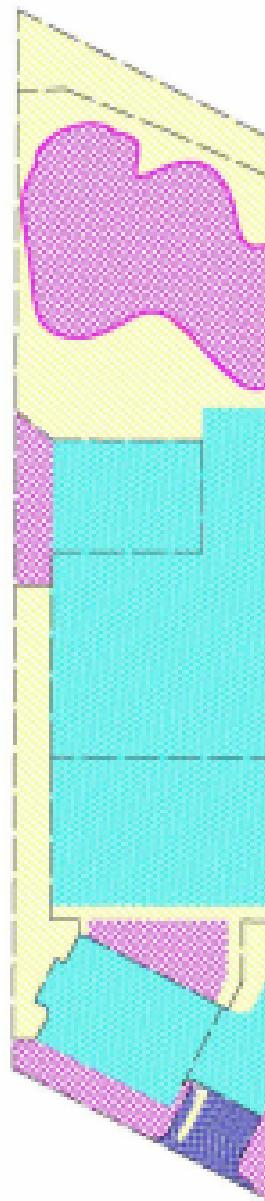

The LID Impervious Calculation for the other ponds will be reviewed with the resubmittal once exhibits are provided.

Unresolved. See example to the right.

Detention Basin Outlet Structure Design

Outflow Hydrograph Workbook Filename:

Storm Inflow Hydrographs

UD-Detention, Version 3.07 (February 2017)

The user can override the calculated inflow hydrographs from this workbook with inflow hydrographs developed in a separate program.

Detention Basin Outlet Structure Design

UD-Detention, Version 3.07 (February 2017)

Summary Stage-Area-Volume-Discharge Relationships

The user can create a summary S-A-V-D by entering the desired stage increments and the remainder of the table will populate automatically.

The user should graphically compare the summary S-A-V-D table to the full S-A-V-D table in the chart to confirm it captures all key transition points.

Detention Basin Outlet Structure Design

UD-Detention, Version 3.07 (February 2017)

Project: FOREST LAKES PHASE 2

Basin ID: POND B - PRELIMINARY DESIGN

	Stage (ft)	Zone Volume (ac-ft)	Outlet Type
Zone 1 (WQCV)	3.06	0.738	Orifice Plate
Zone 2 (EURV)	5.31	1.028	Orifice Plate
Zone 3 (100-year)	8.75	2.117	Weir&Pipe (Restrict)
3.883 Total			

User Input: Orifice at Underdrain Outlet (typically used to drain WQCV in a filtration BMP)

Underdrain Orifice Invert Depth = **N/A** ft (distance below the filtration media surface)
Underdrain Orifice Diameter = **N/A** inches

Calculated Parameters for Underdrain
Underdrain Orifice Area = **N/A** ft²
Underdrain Orifice Centroid = **N/A** feet

User Input: Orifice Plate with one or more orifices or Elliptical Slot Weir (typically used to drain WQCV and/or EURV in a sedimentation BMP)

Invert of Lowest Orifice = **0.00** ft (relative to basin bottom at Stage = 0 ft)
Depth at top of Zone using Orifice Plate = **6.00** ft (relative to basin bottom at Stage = 0 ft)
Orifice Plate: Orifice Vertical Spacing = **N/A** inches
Orifice Plate: Orifice Area per Row = **N/A** inches

Calculated Parameters for Plate
WQ Orifice Area per Row = **N/A** ft²
Elliptical Half-Width = **N/A** feet
Elliptical Slot Centroid = **N/A** feet
Elliptical Slot Area = **N/A** ft²

User Input: Stage and Total Area of Each Orifice Row (numbered from lowest to highest)

Row 1 (required)	Row 2 (optional)	Row 3 (optional)	Row 4 (optional)	Row 5 (optional)	Row 6 (optional)	Row 7 (optional)	Row 8 (optional)
Stage of Orifice Centroid (ft)	0.00	2.00	4.00				
Orifice Area (sq. inches)	4.00	8.00	12.00				
Row 9 (optional)	Row 10 (optional)	Row 11 (optional)	Row 12 (optional)	Row 13 (optional)	Row 14 (optional)	Row 15 (optional)	Row 16 (optional)
Stage of Orifice Centroid (ft)							
Orifice Area (sq. inches)							

User Input: Vertical Orifice (Circular or Rectangular)

Invert of Vertical Orifice = **N/A** ft (relative to basin bottom at Stage = 0 ft)
Depth at top of Zone using Vertical Orifice = **N/A** ft (relative to basin bottom at Stage = 0 ft)
Vertical Orifice Diameter = **N/A** inches

Calculated Parameters for Vertical Orifice

Not Selected	Not Selected
N/A	N/A
N/A	N/A
N/A	N/A

User Input: Overflow Weir (Dropbox) and Grate (Flat or Sloped)

Overflow Weir Front Edge Height, H_o = **6.00** ft (relative to basin bottom at Stage = 0 ft)
Overflow Weir Front Edge Length = **6.00** feet
Overflow Weir Slope = **4.00** H:V (enter zero for flat grate)
Horiz. Length of Weir Sides = **4.00** feet
Overflow Grate Open Area % = **85%** %, grate open area/total area
Debris Clogging % = **50%** %

Calculated Parameters for Overflow Weir
Height of Grate Upper Edge, H_g = **7.00** feet
Over Flow Weir Slope Length = **4.12** feet
Grate Open Area / 100-yr Orifice Area = **2.97** should be ≥ 4
Overflow Grate Open Area w/o Debris = **21.03** ft²
Overflow Grate Open Area w/ Debris = **10.51** ft²

User Input: Outlet Pipe w/ Flow Restriction Plate (Circular Orifice, Restrictor Plate, or Rectangular Orifice)

Depth to Invert of Outlet Pipe = **0.20** ft (distance below basin bottom at Stage = 0 ft)
Outlet Pipe Diameter = **36.00** inches
Restrictor Plate Height Above Pipe Invert = **36.00** inches

Calculated Parameters for Overflow Weir

Zone 3 Weir	Not Selected
7.00	N/A
4.12	N/A
2.97	N/A
21.03	N/A
10.51	N/A

User Input: Emergency Spillway (Rectangular or Trapezoidal)

Spillway Invert Stage = **9.00** ft (relative to basin bottom at Stage = 0 ft)
Spillway Crest Length = **50.00** feet
Spillway End Slopes = **10.00** H:V
Freeboard above Max Water Surface = **1.00** feet

Calculated Parameters for Spillway

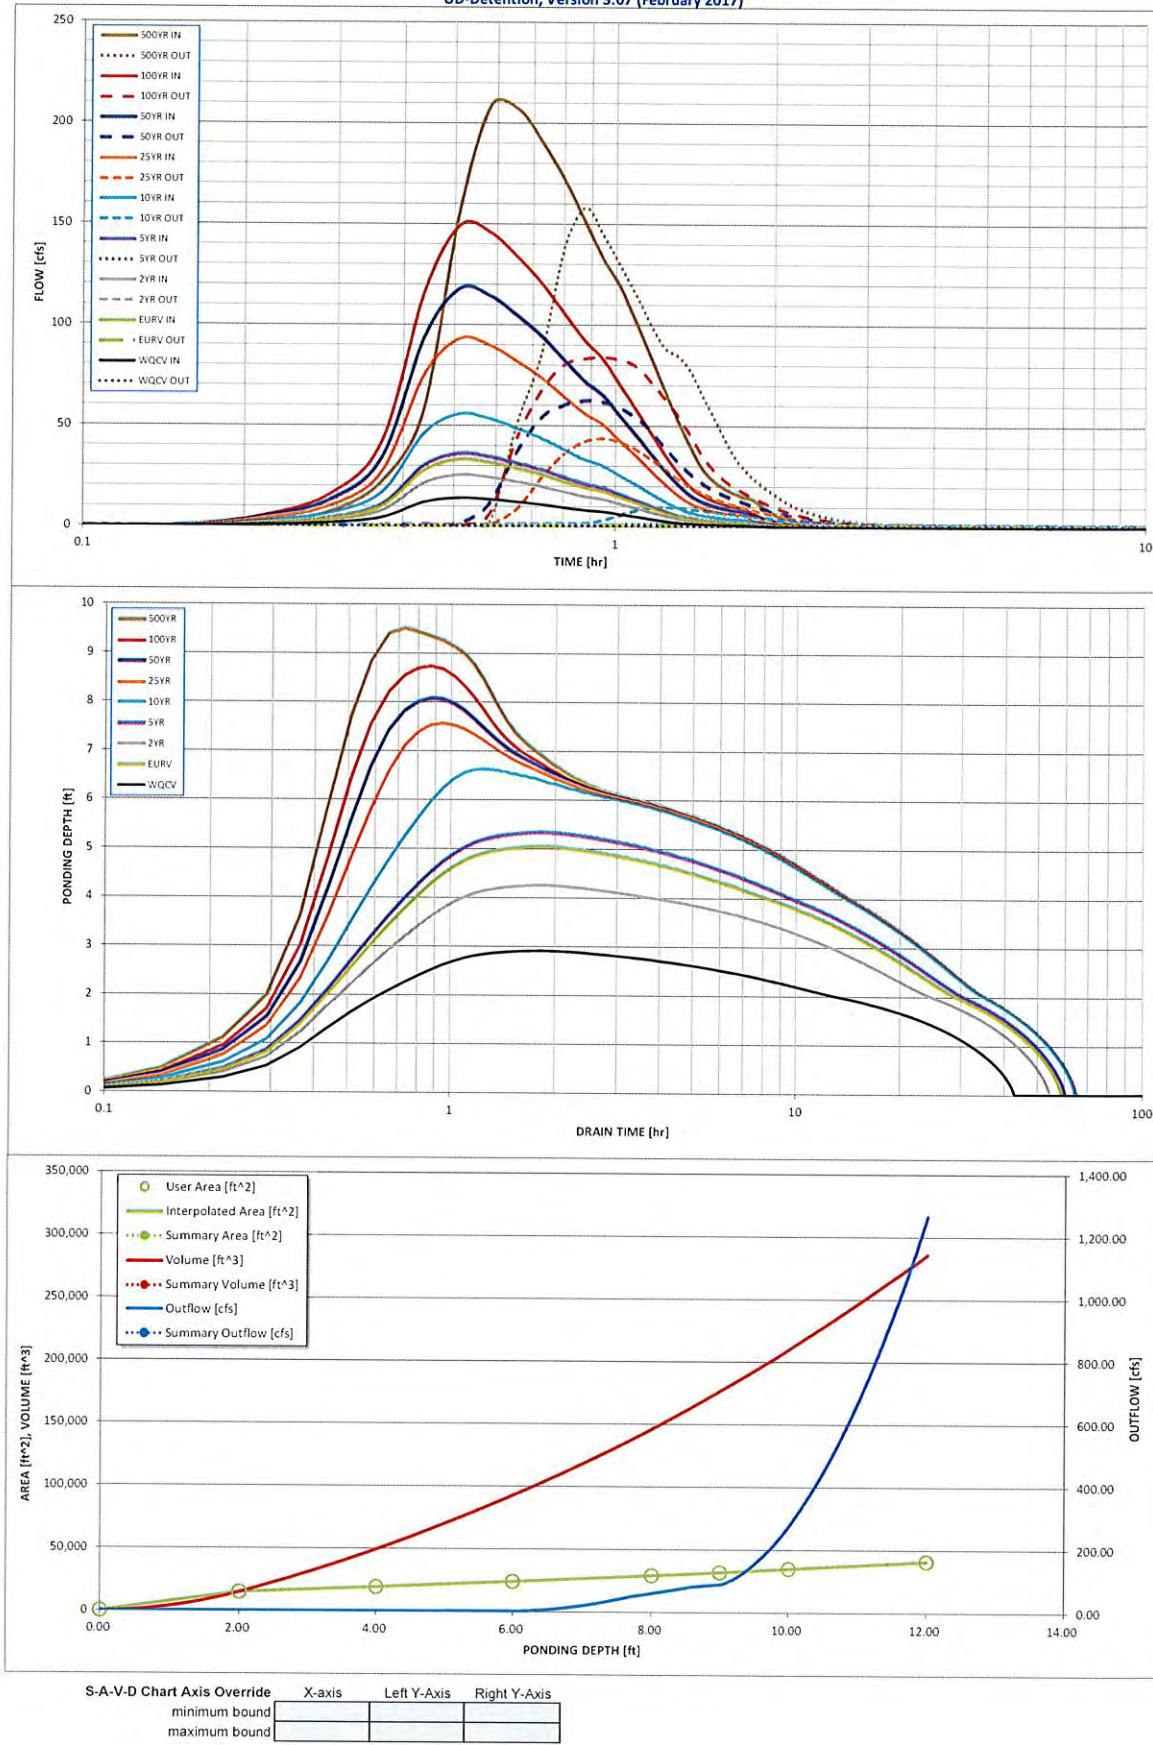

Spillway Design Flow Depth=	0.75
Stage at Top of Freeboard =	10.75
Basin Area at Top of Freeboard =	0.85

Detention Basin Outlet Structure Design

Outflow Hydrograph Workbook Filename:

Storm Inflow Hydrographs

UD-Detention, Version 3.07 (February 2017)

The user can override the calculated inflow hydrographs from this workbook with inflow hydrographs developed in a separate program.

Detention Basin Outlet Structure Design

UD-Detention, Version 3.07 (February 2017)

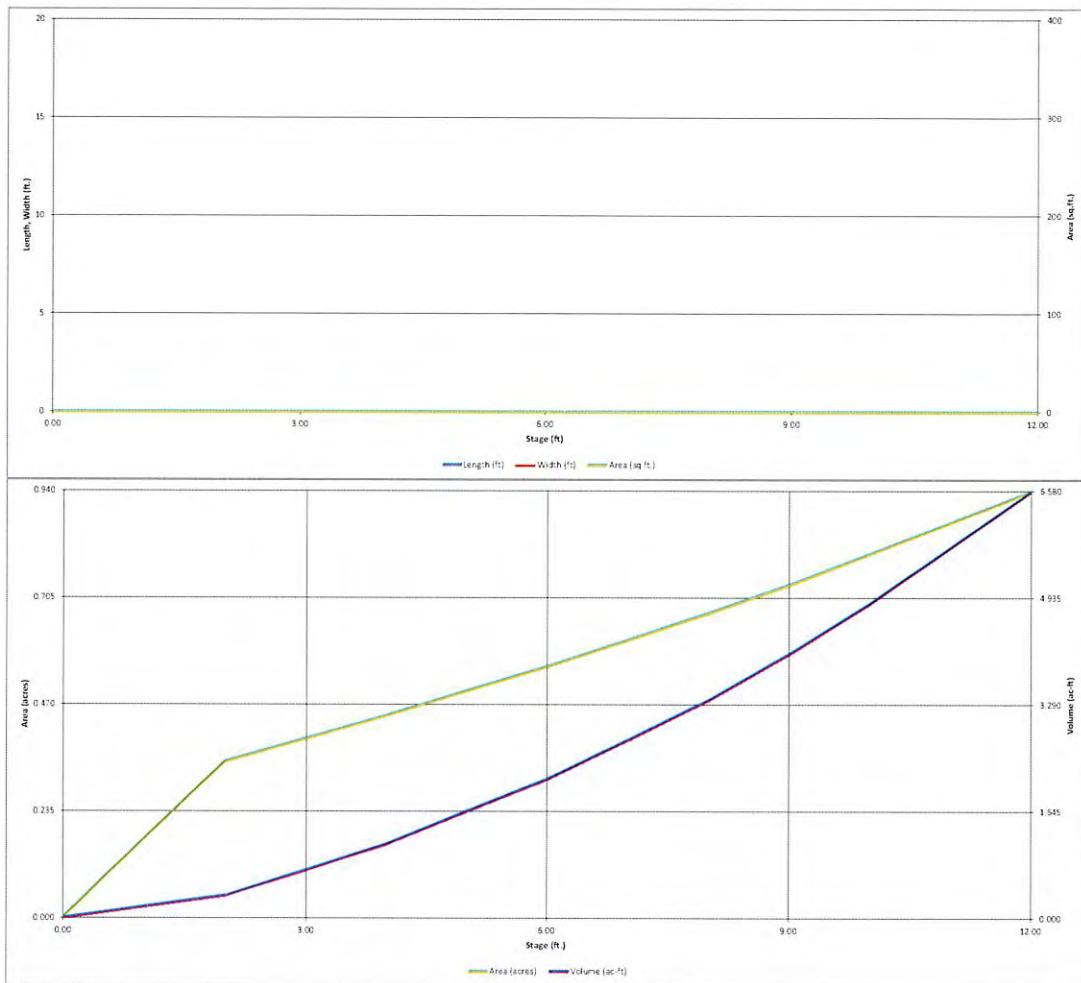

Summary Stage-Area-Volume-Discharge Relationships

The user can create a summary S-A-V-D by entering the desired stage increments and the remainder of the table will populate automatically.

The user should graphically compare the summary S-A-V-D table to the full S-A-V-D table in the chart to confirm it captures all key transition points.

<p>1. Basin Storage Volume</p> <p>A) Effective Imperviousness of Tributary Area, I_a</p> <p>B) Tributary Area's Imperviousness Ratio ($i = I_a / 100$)</p> <p>C) Contributing Watershed Area</p> <p>D) For Watersheds Outside of the Denver Region, Depth of Average Runoff Producing Storm</p> <p>E) Design Concept (Select EURV when also designing for flood control)</p> <p>F) Design Volume (WQCV) Based on 40-hour Drain Time $V_{DESIGN} = (1.0 * (0.91 * i^3 - 1.19 * i^2 + 0.78 * i) / 12 * Area)$</p> <p>G) For Watersheds Outside of the Denver Region, Water Quality Capture Volume (WQCV) Design Volume ($V_{WQCV\ OTHER} = (d_6 * (V_{DESIGN}/0.43))$)</p> <p>H) User Input of Water Quality Capture Volume (WQCV) Design Volume (Only if a different WQCV Design Volume is desired)</p> <p>I) Predominant Watershed NRCS Soil Group</p> <p>J) Excess Urban Runoff Volume (EURV) Design Volume For HSG A: $EURV_A = 1.68 * i^{1.28}$ For HSG B: $EURV_B = 1.36 * i^{1.08}$ For HSG C/D: $EURV_{C/D} = 1.20 * i^{1.08}$</p>	<p>$I_a = 35.5 \%$</p> <p>$i = 0.355$</p> <p>Area = 30.280 ac</p> <p>$d_6 = 0.42 \text{ in}$</p> <p>Choose One</p> <p><input type="radio"/> Water Quality Capture Volume (WQCV)</p> <p><input checked="" type="radio"/> Excess Urban Runoff Volume (EURV)</p> <p>$V_{DESIGN} = 0.423 \text{ ac-ft}$</p> <p>$V_{DESIGN\ OTHER} = 0.413 \text{ ac-ft}$</p> <p>$V_{DESIGN\ USER} = \text{ac-ft}$</p> <p>Choose One</p> <p><input type="radio"/> A</p> <p><input checked="" type="radio"/> B</p> <p><input type="radio"/> C / D</p> <p>$EURV = 1.121 \text{ ac-ft}$</p> <p>$L : W = 2.0 : 1$</p> <p>$Z = 4.00 \text{ ft / ft}$</p> <p>_____ _____ _____</p>
2. Basin Shape: Length to Width Ratio (A basin length to width ratio of at least 2:1 will improve TSS reduction.)	
3. Basin Side Slopes	
A) Basin Maximum Side Slopes (Horizontal distance per unit vertical, 4:1 or flatter preferred)	
4. Inlet	
A) Describe means of providing energy dissipation at concentrated inflow locations:	

Design Procedure Form: Extended Detention Basin (EDB)

5. Forebay

A) Minimum Forebay Volume
($V_{FMIN} = \underline{\hspace{2cm}}\% \text{ of the WQCV}$)

$$V_{FMIN} = \underline{\hspace{2cm}} \text{ ac-ft}$$

B) Actual Forebay Volume

$$V_F = \underline{\hspace{2cm}} \text{ ac-ft}$$

C) Forebay Depth
($D_F = \underline{\hspace{2cm}} \text{ inch maximum}$)

$$D_F = \underline{\hspace{2cm}} \text{ in}$$

D) Forebay Discharge

i) Undetained 100-year Peak Discharge

$$Q_{100} = \underline{\hspace{2cm}} \text{ cfs}$$

ii) Forebay Discharge Design Flow

$$(Q_F = 0.02 * Q_{100})$$

$$Q_F = \underline{\hspace{2cm}} \text{ cfs}$$

E) Forebay Discharge Design

Choose One

 Berm With Pipe
 Wall with Rect. Notch
 Wall with V-Notch Weir
(flow too small for berm w/ pipe)

F) Discharge Pipe Size (minimum 6-inches)

$$\text{Calculated } D_L = \underline{\hspace{2cm}} \text{ in}$$

G) Rectangular Notch Width

$$\text{Calculated } W_N = \underline{\hspace{2cm}} \text{ in}$$

6. Trickle Channel

A) Type of Trickle Channel

Choose One

 Concrete
 Soft Bottom

F) Slope of Trickle Channel

$$S = \underline{\hspace{2cm}} \text{ ft / ft}$$

7. Micropool and Outlet Structure

A) Depth of Micropool (2.5-feet minimum)

$$D_M = \underline{\hspace{2cm}} \text{ ft}$$

B) Surface Area of Micropool (10 ft² minimum)

$$A_M = \underline{\hspace{2cm}} \text{ sq ft}$$

C) Outlet Type

Choose One

 Orifice Plate
 Other (Describe):

D) Smallest Dimension of Orifice Opening Based on Hydrograph Routing
(Use UD-Detention)

$$D_{orifice} = \underline{\hspace{2cm}} \text{ inches}$$

E) Total Outlet Area

$$A_{tot} = \underline{\hspace{2cm}} \text{ square inches}$$

Design Procedure Form: Extended Detention Basin (EDB)

Sheet 3 of 4

Designer:	Matt Larson
Company:	Classic Consulting Engineers & Surveyors, LLC
Date:	November 20, 2018
Project:	FOREST LAKES - PHASE 2
Location:	POND C

8. Initial Surcharge Volume

- A) Depth of Initial Surcharge Volume
(Minimum recommended depth is 4 inches)
- B) Minimum Initial Surcharge Volume
(Minimum volume of 0.3% of the WQCV)
- C) Initial Surcharge Provided Above Micropool

$D_{IS} = \underline{\hspace{2cm}} 4 \underline{\hspace{2cm}}$ in

$V_{IS} = \underline{\hspace{2cm}} 54.0 \underline{\hspace{2cm}}$ cu ft

$V_s = \underline{\hspace{2cm}} 83.3 \underline{\hspace{2cm}}$ cu ft

9. Trash Rack

- A) Water Quality Screen Open Area: $A_t = A_{tot} * e^{0.0550}$
- B) Type of Screen (If specifying an alternative to the materials recommended in the USDCM, indicate "other" and enter the ratio of the total open area to the total screen area for the material specified.)
- C) Ratio of Total Open Area to Total Area (only for type 'Other')
- D) Total Water Quality Screen Area (based on screen type)
- E) Depth of Design Volume (EURV or WQCV)
(Based on design concept chosen under 1E)
- F) Height of Water Quality Screen (H_{TR})
- G) Width of Water Quality Screen Opening ($W_{opening}$)
(Minimum of 12 inches is recommended)

$A_t = \underline{\hspace{2cm}} 210 \underline{\hspace{2cm}}$ square inches

S.S. Well Screen with 60% Open Area

User Ratio =

$A_{total} = \underline{\hspace{2cm}} 350 \underline{\hspace{2cm}}$ sq. in.

$H = \underline{\hspace{2cm}} 5 \underline{\hspace{2cm}}$ feet

$H_{TR} = \underline{\hspace{2cm}} 88 \underline{\hspace{2cm}}$ inches

$W_{opening} = \underline{\hspace{2cm}} 12.0 \underline{\hspace{2cm}}$ inches

DETENTION BASIN STAGE-STORAGE TABLE BUILDER

UD-Detention, Version 3.07 (February 2017)

Detention Basin Outlet Structure Design

UD-Detention, Version 3.07 (February 2017)

Project: FOREST LAKES PHASE 2

Basin ID: POND C - PRELIMINARY DESIGN

	Stage (ft)	Zone Volume (ac-ft)	Outlet Type
Zone 1 (WQCV)	2.07	0.423	Orifice Plate
Zone 2 (EURV)	3.66	0.695	Orifice Plate
Zone 3 (100-year)	5.67	1.120	Weir&Pipe (Restrict)
			2.238 Total

User Input: Orifice at Underdrain Outlet (typically used to drain WQCV in a Filtration BMP)

Underdrain Orifice Invert Depth = N/A ft (distance below the filtration media surface)
Underdrain Orifice Diameter = N/A inches

Calculated Parameters for Underdrain

Underdrain Orifice Area = N/A ft²
Underdrain Orifice Centroid = N/A feet

User Input: Orifice Plate with one or more orifices or Elliptical Slot Weir (typically used to drain WQCV and/or EURV in a sedimentation BMP)

Invert of Lowest Orifice = 0.00 ft (relative to basin bottom at Stage = 0 ft)
Depth at top of Zone using Orifice Plate = 4.00 ft (relative to basin bottom at Stage = 0 ft)
Orifice Plate: Orifice Vertical Spacing = N/A inches
Orifice Plate: Orifice Area per Row = N/A inches

Calculated Parameters for Plate

WQ Orifice Area per Row = N/A ft²
Elliptical Half-Width = N/A feet
Elliptical Slot Centroid = N/A feet
Elliptical Slot Area = N/A ft²

User Input: Stage and Total Area of Each Orifice Row (numbered from lowest to highest)

Row 1 (required)	Row 2 (optional)	Row 3 (optional)	Row 4 (optional)	Row 5 (optional)	Row 6 (optional)	Row 7 (optional)	Row 8 (optional)
Stage of Orifice Centroid (ft)	0.00	1.33	2.66				
Orifice Area (sq. inches)	3.00	3.00	6.00				
Stage of Orifice Centroid (ft)				Row 12 (optional)	Row 13 (optional)	Row 14 (optional)	Row 15 (optional)
Orifice Area (sq. inches)							Row 16 (optional)

User Input: Vertical Orifice (Circular or Rectangular)

Invert of Vertical Orifice = Not Selected ft (relative to basin bottom at Stage = 0 ft)
Depth at top of Zone using Vertical Orifice = N/A ft (relative to basin bottom at Stage = 0 ft)
Vertical Orifice Diameter = N/A inches

Calculated Parameters for Vertical Orifice

Vertical Orifice Area = N/A ft²
Vertical Orifice Centroid = N/A feet

User Input: Overflow Weir (Dropbox) and Grate (Flat or Sloped)

Overflow Weir Front Edge Height, H_o = 4.00 ft (relative to basin bottom at Stage = 0 ft)
Overflow Weir Front Edge Length = 6.00 feet
Overflow Weir Slope = 4.00 H:V (enter zero for flat grate)
Horiz. Length of Weir Sides = 4.00 feet
Overflow Grate Open Area % = 85% % grate open area/total area
Debris Clogging % = 50% %

Calculated Parameters for Overflow Weir

Zone 3 Weir = 5.00 ft
Height of Grate Upper Edge, H_g = 5.00 N/A feet
Over Flow Weir Slope Length = 4.12 N/A feet
Grate Open Area / 100-yr Orifice Area = 6.69 N/A should be ≥ 4
Overflow Grate Open Area w/o Debris = 21.03 N/A ft²
Overflow Grate Open Area w/ Debris = 10.51 N/A ft²

User Input: Outlet Pipe w/ Flow Restriction Plate (Circular Orifice, Restrictor Plate, or Rectangular Orifice)

Zone 3 Restrictor = Not Selected ft (distance below basin bottom at Stage = 0 ft)
Depth to Invert of Outlet Pipe = 0.20 N/A feet
Outlet Pipe Diameter = 24.00 N/A inches
Restrictor Plate Height Above Pipe Invert = 24.00 inches

Calculated Parameters for Outlet Pipe w/ Flow Restriction Plate

Zone 3 Restrictor = 3.14 N/A ft²
Outlet Orifice Area = 3.14 N/A feet
Outlet Orifice Centroid = 1.00 N/A feet
Half-Central Angle of Restrictor Plate on Pipe = 3.14 N/A radians

User Input: Emergency Spillway (Rectangular or Trapezoidal)

Spillway Invert Stage= 9.00 ft (relative to basin bottom at Stage = 0 ft)
Spillway Crest Length = 38.00 feet
Spillway End Slopes = 10.00 H:V
Freeboard above Max Water Surface = 1.00 feet

Calculated Parameters for Spillway

Spillway Design Flow Depth= 0.65 feet
Stage at Top of Freeboard = 10.65 feet
Basin Area at Top of Freeboard = 1.00 acres

Detention Basin Outlet Structure Design

Outflow Hydrograph Workbook Filename:

Storm Inflow Hydrographs

UD-Detention, Version 3.07 (February 2017)

The user can override the calculated inflow hydrographs from this workbook with inflow hydrographs developed in a separate program.

Detention Basin Outlet Structure Design

UD-Detention, Version 3.07 (February 2017)

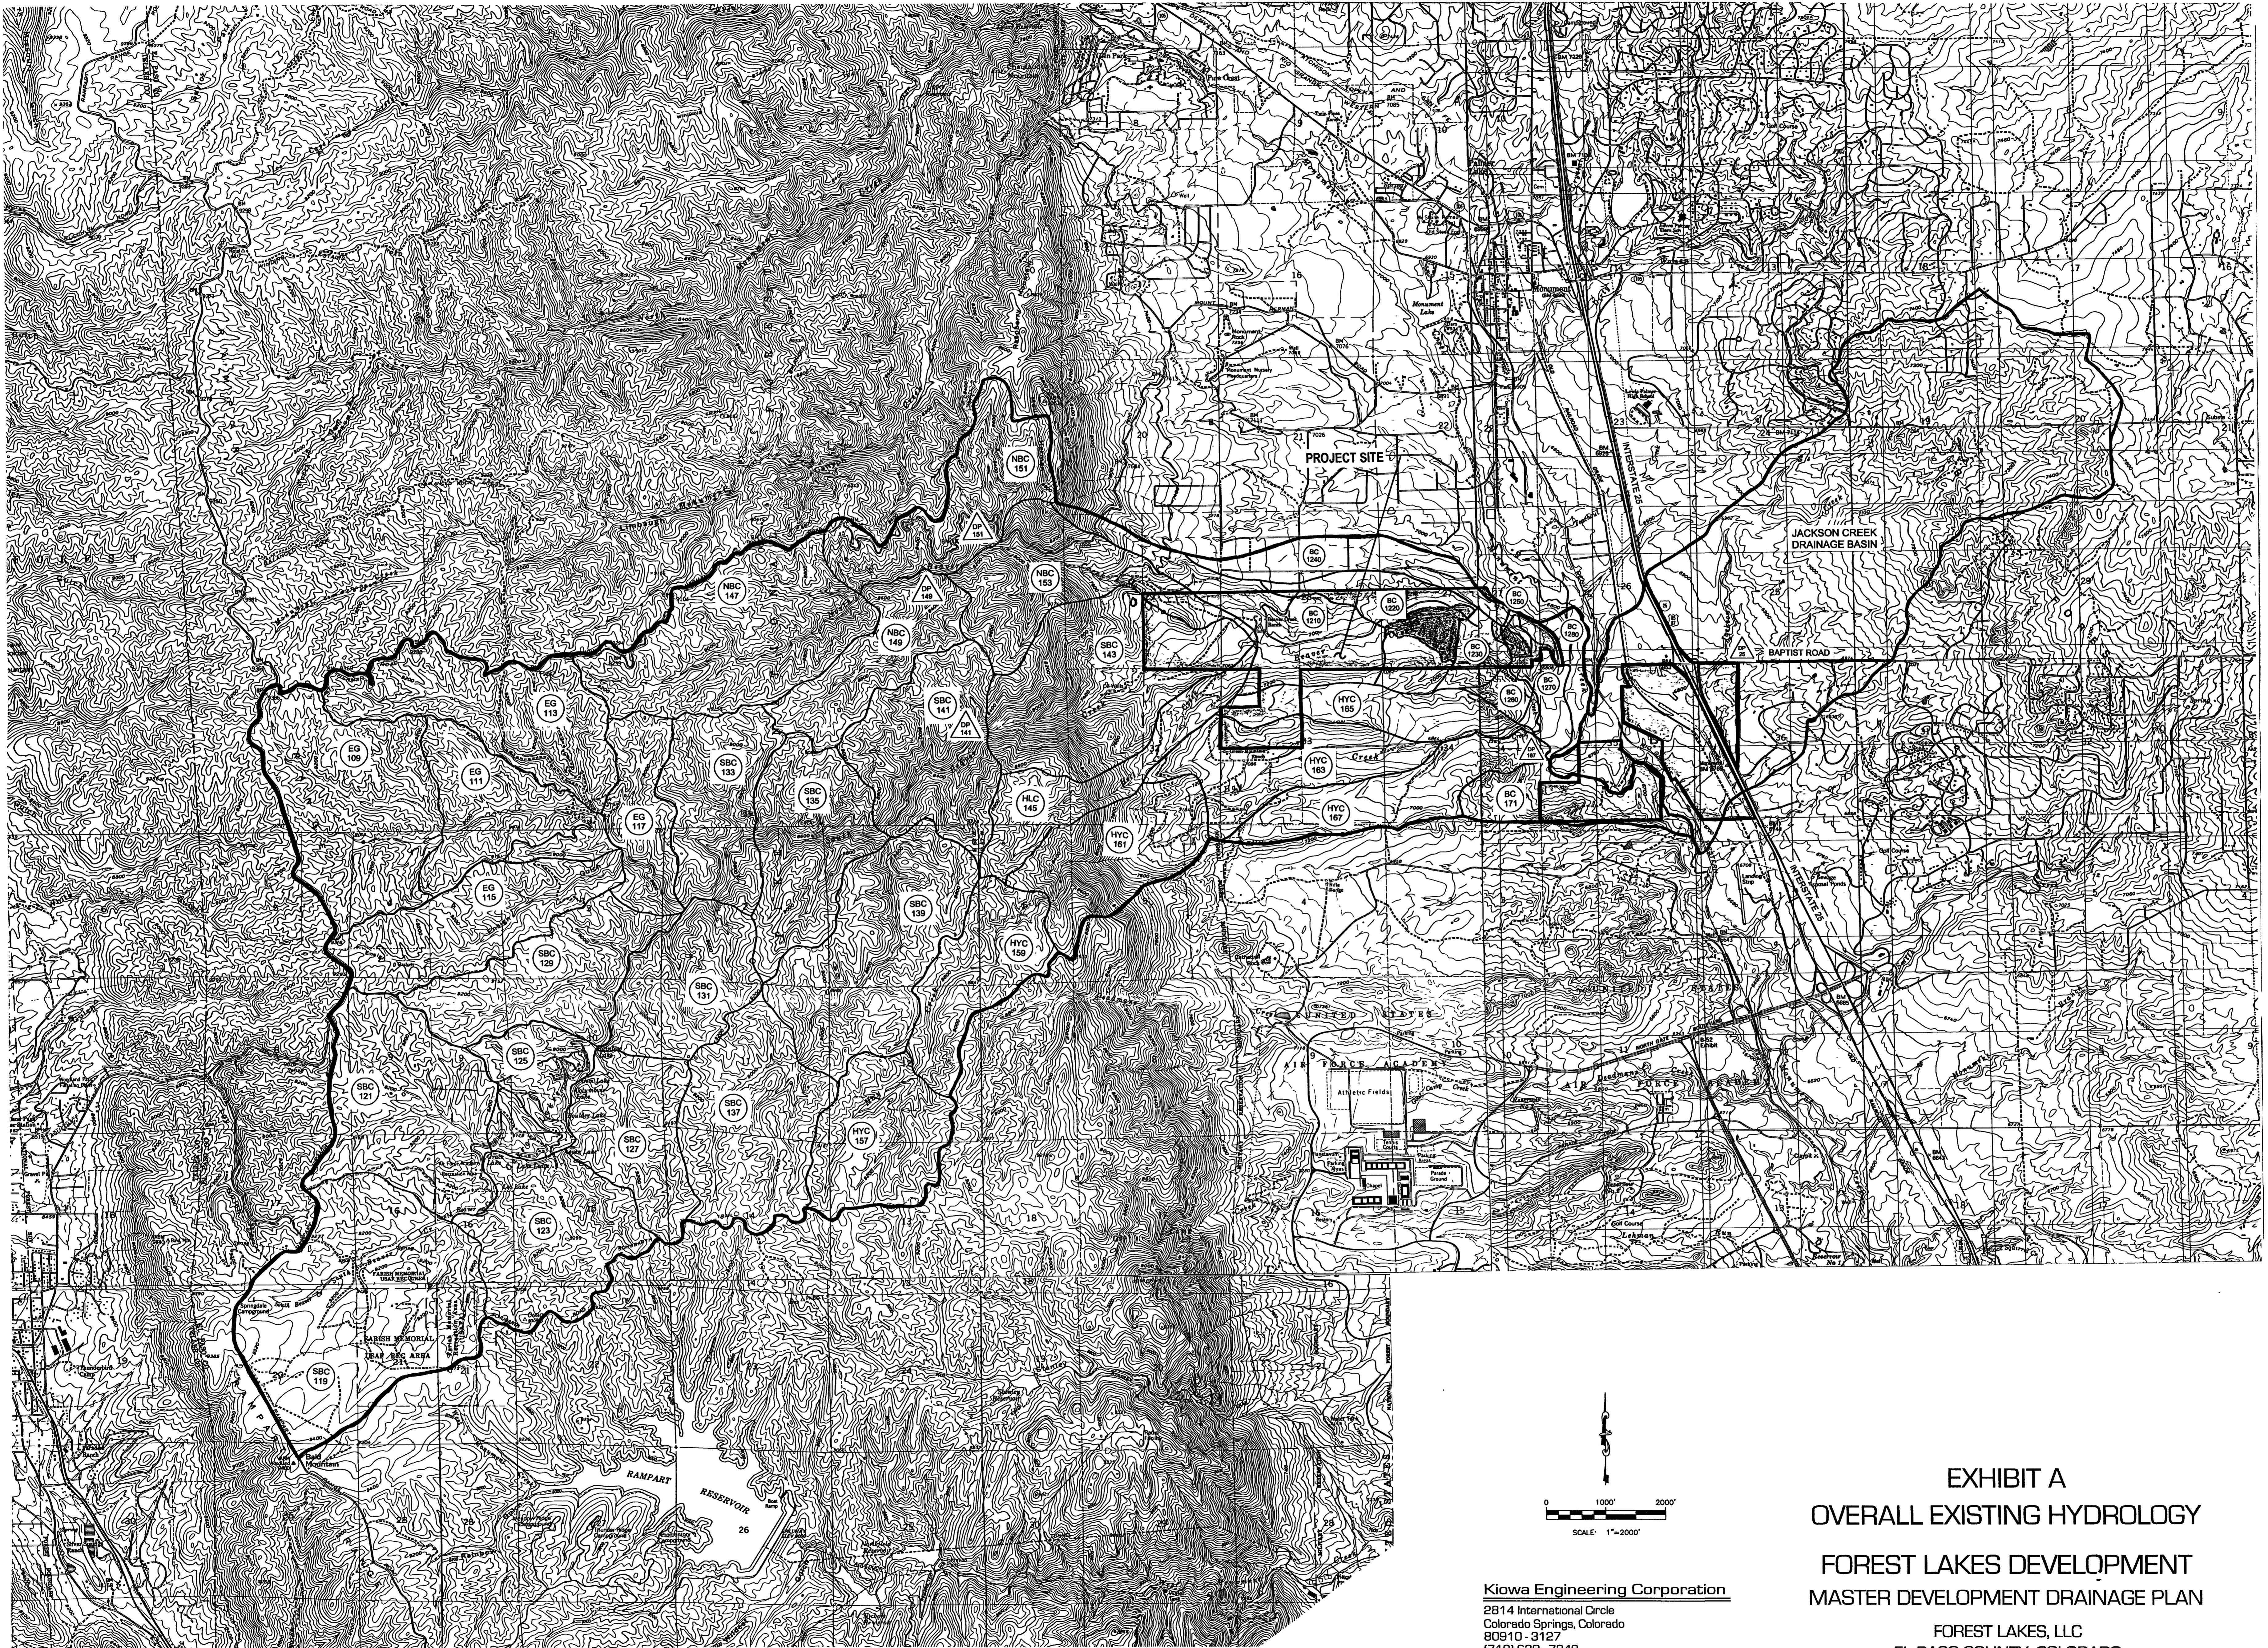

Summary Stage-Area-Volume-Discharge Relationships

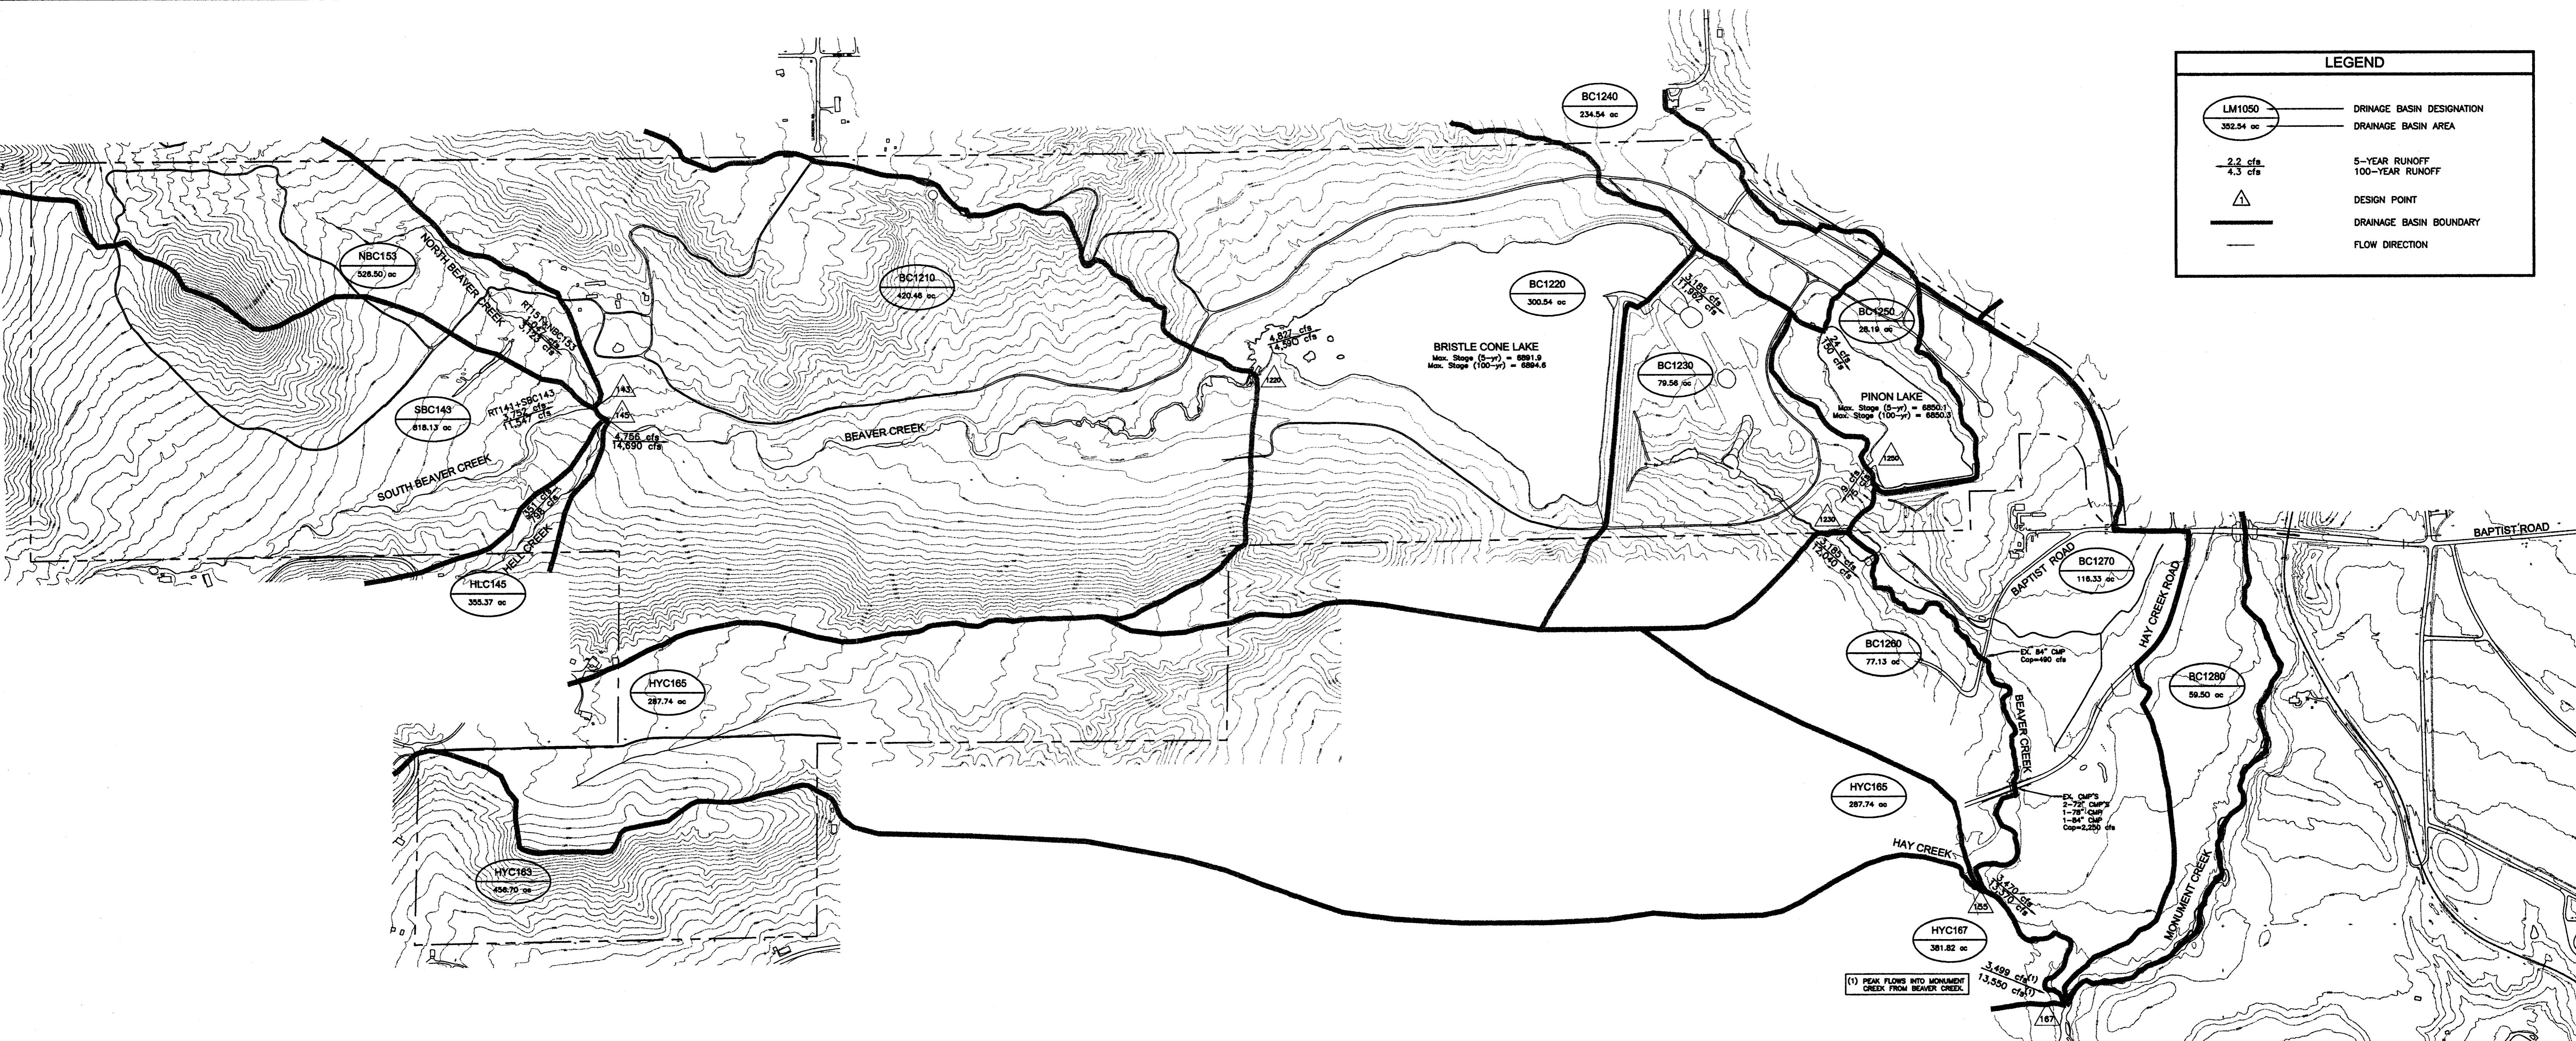

The user can create a summary S-A-V-D by entering the desired stage increments and the remainder of the table will populate automatically.

The user should graphically compare the summary S-A-V-D table to the full S-A-V-D table in the chart to confirm it captures all key transition points.

Provide an exhibit showing the DCIA, UIA, RPA, SPA areas for Pond A, B, & C.

Based on the site layout a large portion of SPA does not directly drain into the pond but instead goes through the DCIA before draining into the Detention Pond. These areas upstream of the DCIA should not be counted as SPA. The only applicable SPA would be the pond area itself.

In reviewing the sub-basin, the only possible area where RPA may exist is west of the pond along the back of lots 102-106.

The LID Impervious Calculation for the other ponds will be reviewed with the resubmittal once exhibits are provided.

Unresolved. See example to the right.

Show the emergency overflow path for these diversion inlets.

Unresolved. Show the specific routing. Based on the narrative on pg 9, a typical side lot swale may not have capacity for the 100yr flow. A concern is that fences are typically installed along the back and side lot lines which would impede flows for the emergency flow path.
