DRAINAGE REPORT STATEMENT

ENGINEER'S STATEMENT:

The attached drainage plan and report were prepared under my direction and supervision and are correct to the best of my knowledge and belief. Said drainage report has been prepared according to the criteria established by the Drainage Criteria Manual for the City of Colorado Springs and El Paso County. I accept responsibility for any liability caused by any negligent acts, errors, or omissions on my part in preparing this report.

L Ducett, Colorado P.E. #32339

Date

DEVELOPER'S STATEMENT:

I, the developer, have read and will comply with all of the requirements specified in this drainage report and plan.

Business Name: 4-Way Ranch Joint Venture

Title: _____

Address: P.O. Box 50223

Colorado Springs, CO 80949

EL PASO COUNTY:

Filed in accordance with Section 51.1 of the El Paso Land Development Code, as amended.

 CONCEPTUAL DRAINAGE REPORT/ POND CALCULATIONS BY CLASSIC CONSULTING

PURPOSE

This document is Preliminary Drainage Report for Waterbury Phase 2 Preliminary Plan. The purpose of this report is to schematically address on-site and off-site drainage patterns as discussed and approved

within the Master Development Drainage Plan (MDDP) for 4-Way Ranch – Phase 1 and provide general methods to handle these flows based on the PUD Development Plan and Phase 2 Preliminary Plan via on-site detention and possible channel improvements in order to limit any flows released off-site to historic levels or less. This report will remain in general compliance with the recently approved MDDP and be followed up with a Final Drainage Report submitted in conjunction with any Final Plat submittals. This report is in general conformance with the previously submitted “Conceptual Drainage Report for Waterbury (PUD Development Plan)” (CDR) by Classic Consulting Engineers and Surveyors, LLC dated May, August and November 2012. This report will lean heavily on this previous report. This report will lay the groundwork for the phasing and interim routing of storm water for the development of this phase. Additional details and calculations will be provided in the Final Drainage Report.

GENERAL DESCRIPTION

The Waterbury (PUD Development Plan) site is a 322-acre site located in the county of El Paso within Sections 28, 29 and 33, Township 12 South, Range 64 West of the Sixth Principal Meridian, El Paso County, Colorado. This report covers the area known as the Waterbury Phase 2 Preliminary Plan which is a part of the overall PUD Development Plan. This Phase is 78.384 acres and is north of the Phase 1 Preliminary Plan area. The site is bounded on the north by unplatted property (future phases of the overall 4-Way Ranch property), to the east by unplatted property (future phases of the overall 4-Way Ranch property), to the south by the recently platted lots (4-Way Ranch Filing No. 3), and to the west by Eastonville Road. The site is 78.384 acres and is proposed for 234 single family units with 19.1 acres of tracts of which 16.14 acres is open space and drainage tracts. The residential lots will range in size from a 4600 S.F. to 10,000 S.F. The Preliminary Plan that was previously submitted remains generally consistent with the currently approved PUD Development Plan, Zoning and Conceptual Plan for 4-Way Ranch Phase 1. However, the zoning approval of 3.5 DU/acre allows for 1,610 units and the PUD Development Plan proposes only 1,000 units. This reduction in density will likely slightly reduce the size of the required detention facilities and on-site developed flows as presented in the MDDP. A first phase Final Plat will be submitted at a later date based on the area phasing plan. At that time, a final drainage report for this platted area will better define the exact storm systems, any channel improvements and detention facilities.

The average soil condition reflects Hydrologic Groups “A” (Columbine gravelly sandy loam 19) and “B” (Stapleton sandy loam 83), as determined by the “Soil Survey of El Paso County Area,” prepared by the Soil Conservation Service. (See Appendix) For the purposes of the hydrologic calculations within this report, the soil type B was utilized.

EXISTING DRAINAGE CONDITIONS

Existing drainage from the Waterbury Phase 2 Preliminary Plan site is generally from northwest to southeast by way of existing natural drainage swales. The majority of the site is covered with native grasses and no trees. There are three major drainageways on the site:

Two offsite basins enter into the site from culverts under Eastonville Road.

These existing facilities (30" CMP and 36" CMP) currently take undetained historic flows mainly from the Falcon High School property. Any further future development within these basins per the Conceptual Drainage Plan(CDR) (Basins OS-5 and OS-6, $Q_5 = 5$ cfs and $Q_{100} = 11$ cfs and $Q_5 = 6$ cfs and $Q_{100} = 19$ cfs), respectively), as presented in the MDDP (Basins WFB3A and WFB3B, Design Points 5 and 4, $Q_5=5.8$ $Q_{100}=18.8$, $Q_5=2.5$ $Q_{100}=6.5$ respectively), will be required to detain to the historic levels as these flows are used in any downstream calculations. Basin OS-1 corresponds with the CDR basin OS-6 and the MDDP Basin WFB3A (Design Point 5) and has approximately 13.3 acres producing flows of 8.5 cfs and 19.6 cfs in the historic 5 and 100 year conditions at **Design Point OS-1**.

Basin OS-2 (OS-5 from the CDR and WFB3B Design Point 4 from the MDDP) has 3.2 acres and produces flow of 1.7 and 3.8 cfs in the 5 and 100 year conditions at **Design Point OS-2**. These flows are slightly lower than the CDR and will be verified with the Final Drainage Report. Per the MDDP, flows are greatly reduced at this point as flows from the high school have been redirected across Londonderry Road and to the south.

Flows from OS-3's 3.9 acres produce a $Q_5=3.6$ cfs and a $Q_{100}=8.6$ cfs at **Design Point OS-3**.

Flows from OS-4's 0.5 acres produce a $Q_5=0.5$ cfs and a $Q_{100}=1.1$ cfs at **Design Point OS-4**.

Flows from OS-5's 1.8 acres produce a $Q_5=1.6$ cfs and a $Q_{100}=3.7$ cfs at **Design Point OS-5**.

Flows from OS-1 enter the site flowing from the west to the east overland through the existing 24" CMP under Eastonville Road and flow overland across Basin 1. Flows from OS-1 combine with runoff from Basin 1's 52.9 acres and Basin OS-5's 1.8 acres to produce total combined flows of $Q_5=36.2$ cfs and $Q_{100}=80.9$ cfs at **Design Point 3**. This basin was called Basin B1 in the MDDP and had flows of 23.8 cfs in the Q_5 and 99 cfs in the Q_{100} . This basin was 74.88 acres in the MDDP and outflowed to Design Point B1-J2.

The intent for this corridor is to remain in its natural state as much as possible but will likely have its

location altered slightly based on the proposed lot layout and may contain some channel improvements including some smaller detention areas. Upon final platting of the lots adjacent to this corridor, the final drainage report will better define the exact flows and present the final channel improvements/detention facilities within this corridor.

Flows from OS-2's 3.2 acres flow from the west to the east under Eastonville Road in an existing 36" CMP culvert and are conveyed in the roadside ditch to design point OS-2. This drainage pattern will be maintained in the roadside ditch until Eastonville Road is improved to an urban cross section. At that time, the party responsible for improving Eastonville Road will likely convey this flow in a storm system. The capacity of the ditch will be verified at the time of the FDR for the subdivision plat of Waterbury that is adjacent to this area.

Basin 2's 7.1 acres produces existing flows of $Q_5=4.6$ cfs and $Q_{100}=10.5$ cfs. These flows are conveyed overland to **Design Point 2** where they flow into the future filing of Waterbury.

Basin 3's 0.9 acres produces existing flows of $Q_5=0.8$ cfs and $Q_{100}=1.9$ cfs. These flows are conveyed overland to **Design Point 1** where they flow offsite into the future filing of Waterbury.

Basin 4's 15.7 acres produces existing flows of $Q_5=7.6$ cfs and $Q_{100}=17.1$ cfs. These flows are combined with flows from Basin OS-4's 0.5 acres where they produce combined flows of $Q_5=8.2$ cfs and $Q_{100}=18.4$ cfs which is conveyed overland to **Design Point 4** where they flow offsite into the future filing of Waterbury.

Basin 5's 3.0 acres produces existing flows of $Q_5=2.0$ cfs and $Q_{100}=4.5$ cfs. These flows are conveyed overland to **Design Point 5** where they flow onto the Waterbury Phase 1 and will be accounted for in the Waterbury Filing 3 Final Drainage Report.

DEVELOPED DRAINAGE CONDITIONS

The following basin descriptions account for the following:

No at-grade inlets have been proposed at this time. All sump conditions have assumed an even split of flows for the preliminary sizing of the Type R inlets at each low point. The individual Final Drainage Report(s) will better define developed flows within each basin to determine curb capacity/at-grade inlet requirements and specific sump inlet sizing based on flows for each side of the street. All preliminary pipe sizing is based on an assumed pipe slope of 1%. Unless there was a major change from the CDR we have used that information where appropriate.

We have left the design points from the CDR in the exhibit for proposed drainage conditions in the appendix. The CDR design points are shown in orange hexagons, the proposed design points for our report

are shown in blue triangles.

Three full spectrum detention ponds were proposed in the CDR. They are Pond 2A, Pond 2B and Pond 2C. Pond 2A will be constructed with Phase 1 Filing 3, Pond 2B will be constructed with Phase 2 Filing 1 and Pond 2C will be constructed with the future phase and filing of Waterbury to the east of Phase 2. The area that drains to Pond 2C will be contained in a temporary sediment basin that is currently being designed as part of Phase 1 Filing 1-3. A temporary swale will take flows from the south east corner of this site's storm sewer and convey it to the temporary sediment basin. Final sizing of these facilities is deferred to the final drainage reports. Preliminary sizing of these facilities was completed with the CDR and have been reviewed but will not be revised for this report.

Off-site flows from the offsite temporary pond at the southwest corner of Londonderry Drive and Eastonville Road will continue to outfall via the (3) 42" RCP's under Eastonville Road and into the natural channel on-site along the westerly property line. These flows ($Q_5 = 28$ cfs and $Q_{100} = 135$ cfs) will then combine with the on-site flows of Basin D's 3.3 acres (which includes rear yards and the 80' ROW of Eastonville Road) ($Q_5 = 2.5$ cfs and $Q_{100} = 5.0$ cfs) and Basin OS-2's 3.2 acres ($Q_5 = 1.7$ cfs and $Q_{100} = 3.8$ cfs). Basin OS-2 flows travel from the west to the east under Eastonville Road in the existing 36" CMP culvert. An existing ditch or a future pipe will carry flows from Basin OS-2 at the east end of the existing culverts and from Basin D to the south and into the outfall from the triple 42" RCP culverts. Combined flows from Basin D and OS-2 are anticipated to be $Q_5=3.3$ cfs, $Q_{100}=6.8$ cfs at **Design Point OS-2**. These flows will combine with flows from the triple 42" culverts and from Design Point D's flow from Basin CC's 1.54 acres of rear yards and with a $Q_5= 1.6$ cfs and a $Q_{100}= 3.3$ cfs and will flow to the south and then eventually into Pond 1 in Filing 1 of Phase 1. Flows from Phase 1 combine with these flows and are conveyed to CDR design point 1 where they are detained in Pond 1. See the CDR and Phase 1 Filing 1 FDR for the sizing of Pond 1. The final drainage report for these specific final platted lots will examine this channel flow further to determine any required improvements and LOMR/CLOMR requirements.

See the CDR's Design Point 1 discussion for flows from this point and flows into Pond 1.

The northwest portion of this development will be routed via public storm systems and the upper portion of the internal natural channel towards the proposed Pond 2A. The following basins are tributary to this facility:

Basin A's 4.86 acres of overland flow flows via curb and gutter to **Design Point A**. Flows at this point are $Q_5=7.5$ cfs and $Q_{100}=14.5$ cfs. It is proposed that these flows will flow via curb and gutter into Filing 3 of

Phase 1. They are picked up at the CDR Design Point 6 in dual 4' sump storm inlets. These inlets will be final designed with the Filing 3 Phase 1 FDR. These flows travel via proposed 30" RCP storm sewer to Pond 2A.

Basin C's 1.2 acres produce overland flows of $Q_5=1.8$ cfs and $Q_{100}=3.6$ cfs. These flows will travel from the back yards of the lots along Eastonville Road in the ditch and then into an area inlet at the rear of the lots where they will combine with flows from the existing 30" CMP culvert under Eastonville Road which conveys Basin OS-1's flow from **Design Point OS-1** on the west side of Eastonville Road's 13.3 acres ($Q_5=8.6$ cfs $Q_{100}=19.7$ cfs) to produce combined flows of $Q_5=10.4$ cfs and $Q_{100}=23.1$ cfs at **Design Point C**. These flows will be collected in a proposed 30" RCP storm sewer (**Pipe Run 1**) and conveyed between the lots in a proposed public drainage easement or tract to the east and into the proposed drainage tract F. At this point they will flow overland and combine with flows from Basin N's 9.63 acres ($Q_5=10.1$ cfs $Q_{100}=21.0$ cfs) to Proposed Pond 2A.

Basin O's 3.51 acres of overland flow flows via curb and gutter to **Design Point O**. Flows at this point are $Q_5=5.9$ cfs and $Q_{100}=11.5$ cfs. It is proposed that these flows will flow via curb and gutter into Filing 3 of Phase 1. They are picked up at the CDR **Design Point 7** in dual 16' sump storm inlets. These inlets will be final designed with the Filing 3 Phase 1 FDR. These flows travel via proposed 42" RCP storm sewer to Pond 2A.

Basin P's 1.73 acres of overland flow flows via curb and gutter to **Design Point P**. Flows at this point are $Q_5=3.5$ cfs and $Q_{100}=7.1$ cfs. It is proposed that these flows will flow via curb and gutter into Filing 3 of Phase 1. They are picked up at the CDR **Design Point 7** in dual 16' sump storm inlets. These inlets will be final designed with the Filing 3 Phase 1 FDR. These flows travel via proposed 42" RCP storm sewer to Pond 2A.

Basin Q's 5.84 acres of overland flow flows via curb and gutter to **Design Point Q**. Flows at this point are $Q_5=8.6$ cfs and $Q_{100}=16.5$ cfs. It is proposed that these flows will flow via curb and gutter into Filing 3 of Phase 1. They are picked up at the CDR **Design Point 7** in dual 16' sump storm inlets. These inlets will be final designed with the Filing 3 Phase 1 FDR. These flows travel via proposed 42" RCP storm sewer to Pond 2A.

Basin R's 1.86 acres of overland flow flows via curb and gutter to **Design Point R**. Flows at this point are $Q_5=2.7$ cfs and $Q_{100}=5.1$ cfs. It is proposed that these flows will flow via curb and gutter into Filing 3 of

Phase 1. They are picked up at the CDR **Design Point 7** in dual 16' sump storm inlets. These inlets will be final designed with the Filing 3 Phase 1 FDR. These flows travel via proposed 42" RCP storm sewer to Pond 2A.

Combined flows at **Design Point 7** from the CDR are $Q_5=29$ cfs and $Q_{100}=62$ cfs. Two 16' sump inlets are proposed at this point with a 42" RCP storm sewer to the proposed Pond 2A.

Basin OS-3's 3.9 acres of overland flow flows overland to **Design Point OS-3**. Flows at this point are $Q_5=7.4$ cfs and $Q_{100}=14.6$ cfs. It is proposed that these flows will flow via overland flow into Basin E where they combine with Basin E's runoff. Basin E's runoff from its 0.63 acres will produce flows of $Q_5=1.5$ cfs and Q_{100} of 3.0 cfs. These flows flow via curb and gutter and combine with flows from Design Point OS-3 to produce combined flows of $Q_5=8.5$ cfs and $Q_{100}=16.9$ cfs at **Design Point E**. In the CDR at **Design Point 9**, dual 4' sump inlets are proposed at this location in the future filing. In the interim, prior to the construction of the future filing, there will be a standpipe and a proposed temporary sediment pond to collect flows and direct them to the proposed 30" RCP storm sewer (**Pipe Run 2**).

Basin F's 1.37 acres of overland flow flows overland and then in curb and gutter to **Design Point F which is also known as Design Point 10 in the CDR**. Flows at this point are $Q_5=2.6$ cfs and $Q_{100}=5.1$ cfs. A 4' sump inlet is proposed at this location. From this point, flows from this inlet will join flows from Design Point E in a proposed 30" RCP (**Pipe Run 3**) storm sewer and flow south to **Design Point G or the CDR Design Point 11**. Combined flows in this pipe from **Design Point F** and **Design Point E** are $Q_5=19.0$ cfs and $Q_{100}=37.6$ cfs.

Basin B's 6.07 acres of runoff ($Q_5=9.5$ cfs $Q_{100}=18.4$ cfs) flows overland and then in curb and gutter to **Design Point B which is also known as Design Point 11 in the CDR**. Flows at this point combine with flows from Basin G's 2.41 acres ($Q_5=4.4$ cfs and $Q_{100}=8.8$ cfs) at **Design Point G** and are a combined flow of $Q_5=15.6$ cfs and $Q_{100}=30.9$ cfs when combined with flows from **Design Point B**. Dual 8' sump inlets are proposed at this location. From this point, flows from this inlet will join flows from **Design Point E** in a proposed 36" RCP storm sewer (**Pipe Run 4**) and flow south to **Design Point K or the CDR Design Point 12**. Combined flows in this pipe (**Pipe Run 4**) from **Design Point G** and **Design Point F** are $Q_5=29.4$ cfs and $Q_{100}=57.0$ cfs.

Basin K's 4.16 acres of runoff ($Q_5=6.4$ cfs $Q_{100}=12.3$ cfs) flows overland and then in curb and gutter to **Design Point K which is also known as Design Point 12 in the CDR**. Flows at this point combine with

flows from Basin J's 3.9 acres ($Q_5 = 8.9$ cfs and $Q_{100} = 18.1$ cfs) and Basin OS-4's 0.5 acres ($Q_5 = 1.0$ and $Q_{100} = 1.9$ cfs) and Basin M's 0.83 acres ($Q_5 = 1.7$ and $Q_{100} = 3.4$ cfs) at **Design Point K** and are a combined flow of $Q_5 = 14.4$ cfs and $Q_{100} = 27.8$ cfs. Dual 8' sump inlets are proposed at this location. From this point, flows from this inlet will join flows from **Design Point G** in a proposed 42" RCP storm sewer (**Pipe Run 5**) and flow south to **Pond 2A or the CDR Design Point 13**. Combined flows in this pipe (**Pipe Run 5**) from **Design Point K** are $Q_5 = 42.3$ cfs and $Q_{100} = 81.7$ cfs. Pond 2A is an in-line facility and will release detained flows through a single 30" RCP culvert crossing under Muddy Pond St. into the channel towards Detention Pond 2B. It has the following design parameters per the CDR:

Detention Pond 2A (Full Spectrum)

3.24 Ac.-ft. EURV required

5.11 Ac.-ft. design with 4:1 max. slopes and 8' max. depth

Total In-flow: $Q_5 = 78$ cfs, $Q_{100} = 167$ cfs

Design Release: $Q_5 = 45$ cfs, $Q_{100} = 70$ cfs

Max. 100 yr. WSE = 6939.03

Pond 2A will be constructed as part of this Phase 2 Development. Timing of Pond 2A depends on the phasing of the final platting and will be detailed in the final drainage reports for each filing.

The release from Pond 2A then travels in the downstream channel towards Pond 2B.

Pond 2B has Design Point 14 from the CDR and from Phase I tributary to it and flows from Basin S's 6.86 acres of onsite flow that flow overland and from back yards and the pond tract. Flows from Basin S are $Q_5 = 7.4$ cfs and $Q_{100} = 15.3$ cfs these flows flow overland into Pond 2B at **Design Point S**.

The following Phase I basins are tributary to this facility: See the Filing 1, 2 and 3 Phase I FDR's and the CDR. Per the CDR: Basin B9 develops flows that travel as curb and gutter flow towards **Design Point 14** ($Q_5 = 16$ cfs and $Q_{100} = 33$ cfs). At this location a single 16' Type R sump inlet will collect both the 5 yr. and 100 yr. developed flows completely. The collected flows will then be routed via a 30" RCP in an easterly direction directly into Pond 2B. Basin B10 develops flows that travel as curb and gutter flow towards **Design Point 15** ($Q_5 = 7$ cfs and $Q_{100} = 13$ cfs). At this location two 14' Type R sump inlets will collect both the 5 yr. and 100 yr. developed flows completely. The collected flows will then be routed via a 24" RCP in a northerly direction and directly into Pond 2B. Basin B11 ($Q_5 = 11$ cfs and $Q_{100} = 24$ cfs) develops flows that travel as sheet and channel flow directly into **Pond 2B – Design Point 16** ($Q_5 = 54$ cfs and $Q_{100} = 103$ cfs). This facility is again an in-line facility and will release detained flows through a single

24" RCP culvert crossing under Sunken Meadow Road into the channel towards Detention Pond 2C. It has the following design parameters:

Detention Pond 2B (Full Spectrum)

0.94 Ac.-ft. EURV required

3.68 Ac.-ft. design with 4:1 max. slopes and 8' max. depth

Total In-flow: $Q_5 = 54$ cfs, $Q_{100} = 103$ cfs

Design Release: $Q_5 = 33$ cfs, $Q_{100} = 47$ cfs

Max. 100 yr. WSE = 6925.48

Pond 2B will be constructed as part of this Phase 2 Development. Timing of Pond 2B depends on the phasing of the final platting and will be detailed in the final drainage reports for each filing.

The release from Pond 2B then travels in the downstream channel towards Pond 2C. This facility will collect flows from the central portion of Phase I. See the Phase I FDR's and the CDR for further information on this Pond.

Basin OS 5's 6.67 acres of overland flow flows via curb and gutter to **Design Point OS5**. Flows from this basin alone are $Q_5=11.0$ cfs and $Q_{100}=21.4$ cfs. Flows from Basin OS-5 combine with overland flows from Basin J's 2.0 acres ($Q_5=4.6$ cfs $Q_{100}=9.3$ cfs **Design Point J**) and Basin OS-4's 0.5 acres ($Q_5=1.0$ cfs $Q_{100}=1.9$ cfs **Design Point OS-4**) and Basin I's 2.76 acres ($Q_5=4.5$ cfs $Q_{100}=8.8$ cfs **Design Point I**) and produce total combined flows of $Q_5=19.6$ cfs and $Q_{100}=38.3$ cfs at the **Design Point H**. It is proposed that these flows will flow via curb and gutter into proposed dual 14' sump inlets and then via proposed 36" RCP storm sewer in **Pipe Run 6** to the south where they combine with flows from Basin Z's 3.75 acres ($Q_5=5.8$ cfs $Q_{100}=11.3$ cfs), Basin V's 3.68 acres ($Q_5=5.9$ cfs $Q_{100}=11.5$ cfs), Basin Y's 4.31 acres ($Q_5=7.1$ cfs $Q_{100}=13.9$ cfs), Basin X's 1.18 acres ($Q_5=2.6$ cfs $Q_{100}=5.2$ cfs), Basin W's 2.08 acres ($Q_5=3.7$ cfs $Q_{100}=7.2$ cfs) and basin BB's 1.87 acres ($Q_5=3.4$ cfs $Q_{100}=6.8$ cfs) at **Design Point W**. Total combined flows of $Q_5=26.8$ cfs and $Q_{100}=52.1$ cfs will be collected in two proposed 15' sump inlets and then combined with flows from **Pipe Run 6** and put into a proposed 42" RCP storm sewer **Pipe Run 7** and flow south to proposed Pond C.

Basin U's 4.29 acres of overland flow flows via curb and gutter to **Design Point U**. Flows from this basin alone are $Q_5=6.6$ cfs and $Q_{100}=12.7$ cfs. Flows from Basin T's 1.30 acres ($Q_5=2.1$ cfs, $Q_{100}=4.2$ cfs) combine with overland flows from Basin U at **Design Point U** for total combined flows of $Q_5=8.6$ cfs and $Q_{100}=16.6$ cfs. Dual 6' sump inlets are proposed at this location to collect flows. Flows are then piped via a proposed 30" RCP storm sewer in **Pipe Run 8 to Pipe Run 7**. These combined flows are $Q_5=36.2$ and

Q100=70.1 and are then piped via a proposed 48" RCP storm sewer **Pipe Run 9** to proposed Pond 2C.

Flows from offsite areas in Phase 1 are also tributary to Pond 2C. A temporary pond is proposed for Filing 1, 2 and 3 in Phase I. It is anticipated that Phase 2 will necessitate the final construction of Pond 2C, however it may be best to use temporary ponds to control sediment until the entire subdivision is completed to save on maintenance during the construction phase and preserve the integrity of the pond. This pond phasing will be determined with the final drainage reports that are required at the time of final plat.

Detention Pond 2C (Full Spectrum)

4.50 Ac.-ft. EURV required

6.82 Ac.-ft. design with 6:1 max. slopes and 8' max. depth

Total In-flow: $Q_5 = 137$ cfs, $Q_{100} = 272$ cfs

Design Release: $Q_5 = 43$ cfs, $Q_{100} = 148$ cfs

Historic Release: $Q_5 = 64$ cfs, $Q_{100} = 158$ cfs

Concrete Riser Box elevation = 6897.40

Max. 100 yr. WSE = 6899.22

Two proposed basins that flow off of this filing and into the future Waterbury development are Basin AA (area= 1.53 acres $Q_5=2.6$ cfs $Q_{100}=5.2$ cfs) and Basin DD (area=0.79 acres $Q_5=1.6$ cfs $Q_{100}=3.3$ cfs). These flows will be picked up in future storm sewer and for the interim will be contained in temporary sediment basins for erosion and velocity control and swaled to outflow. Details on these temporary basins will be provided with the final drainage report.

CHANNEL IMPROVEMENTS

Any required channel improvements will likely be phased based on Final Platting. Channel improvement design will also be presented with each individual Final Plat. The major channel improvements within the FEMA 100 yr. floodplain will be in general conformance with the Gieck Ranch DBPS, thus, these improvements will off-set any drainage fees owed. The channel improvements within the center portion of the site (within the 100 yr. floodplain NOT recognized by FEMA) will be designed to accommodate the adjacent lot layouts and open space amenities yet attempt to preserve as much of the natural channel and wetland area as possible. Please note that with the attached latest JD letter from the Corp. of Eng. dated May 16, 2011, the entire site has been cleared of any jurisdictional water of the U.S. Thus, the modification, enhancement or removal of any on-site wetlands would not require a 404 permit. The specific areas where the natural channels are either too shallow or incised, improvements will be provided to handle the

developed flows and control velocities. Probable improvements in such areas may include but not be limited to the following: minor grade control structures, weirs, vegetation enhancements and varying channel widths. Detailed design of these natural channel corridors will be further presented in the final drainage report(s).

MDDP CONFORMANCE

This proposed PUD Development Plan, from a drainage standpoint, follows the general scheme of the MDDP for 4-Way Ranch Phase 1, prepared by ADP, Inc., dated January 2012. The preliminary grading design was based on the natural topography and the suggested major on-site drainage basins depicted in the MDDP, thus the Basin nomenclature used in this report follows what was established in the MDDP. However, based on the Development plan layout and road/open space network, this report suggests the following differences from the MDDP schematic design:

Overall Basin B and the natural channel design

Based on the proposed road network and open space corridors provided along the existing natural channel through the middle portion of the project, we have incorporated two additional detention/stormwater quality ponds (Pond 2A and 2B, in-line with this channel corridor). This design allows for further amenity enhancement, centralizes developed flow to this corridor and utilizes the channel as a water quality feature downstream of the release points and helps minimize the size of the downstream detention facility. Thus, the channel through this corridor will likely contain grade control structures in addition to the suggested vegetation enhancement.

Full Spectrum Detention

The MDDP discusses the requirement of full spectrum detention for all facilities. This project continues to propose this concept. In addition, this project has the ability on-site to provide additional water quality features in various amenity facilities/natural channels and is 100% residential use while proposing 70+ acres of open space. Thus, this development meets the required water quality requirements as described in the DCM Volume II.

DETENTION FACILITIES

All on-site detention facilities have been designed to accommodate the required full spectrum Excess Urban Runoff Volume (EURV) as described by the Denver Urban Drainage and Flood Control District. These facilities are proposed to be owned and maintained by the local Metro District with a private maintenance agreement with the County. Preliminary design data for each facility is contained in the Appendix.

Additional design information related to exact facility sizing and outlet structure design will be provided for each facility within the final drainage report(s) on an as platted basis.

HYDROLOGIC CALCULATIONS

Hydrologic calculations were performed using the City of Colorado Springs/El Paso County Drainage Criteria Manual, as revised in November 1991 and 1994. The overall drainage basin design was calculated in the Conceptual Drainage Report using PondPack V8i with time of concentrations estimated using SCS procedures described in the DCM based upon the hydrologic soil type and runoff curve numbers (CN) chart. (Table 5-4) Individual on-site developed basin design used for preliminary storm system routing was calculated using the Rational Method.

FLOODPLAIN STATEMENT

Portions of this site are located within a Zone A FEMA floodplain as determined by the Flood Insurance Rate Map (F.I.R.M.) Map Numbers 08041C 0575F, with effective date of March 17, 1997. On March 19, 2004 a Letter of Map Revision (LOMR) was obtained to refine the floodplain in this unstudied area (See Appendix). In areas where channel improvements are proposed or roadway crossings affect the floodplain, a CLOMR application will be required.

DRAINAGE & BRIDGE FEES

This site lies within the Gieck Drainage Basin, which is tributary to Chico Creek. These fees will be calculated at time of Final Platting using the impervious acreage method approved by El Paso County. The future Final Drainage Report(s) will utilize the following impervious acreage calculation to determine the required fees.

The entire subdivision has a total area of 322 acres. Phase 2 has 78.384 acres.

The percent imperviousness for this entire subdivision is calculated as follows:

$$322 \text{ Ac.} / 1,000 \text{ lots} = 0.32 \text{ Ac./lot}$$

(Per El Paso County Percent Impervious Chart: **30%**)

$$322 \text{ Ac.} \times 30\% = \mathbf{96.6 \text{ Impervious Ac.}}$$

SUMMARY

This proposed development remains consistent with the previously approved MDDP. All detention facilities have been designed to release at or below historic rates. The proposed development will not adversely impact surrounding developments.

Totals for Area of Interest			4,022.9	100.0%

Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

ARMY CORP. LETTER

DEPARTMENT OF THE ARMY
ALBUQUERQUE DISTRICT, CORPS OF ENGINEERS
Southern Colorado Regulatory Office
200 S. Santa Fe Avenue, Suite 301
Pueblo, Colorado 81003

May 16, 2011

REPLY TO:
ATTENTION OF:

Regulatory Division

SUBJECT: Action No. SPA-2005-00801, FOUR-WAY RANCH Subdivision
jurisdictional determination.

Peter Martz
Land Resource Group
P.O. Box 50223
Colorado Springs, CO 80949

Dear Mr. Martz:

We received your request for a new jurisdictional determination for the Four-Way Ranch Subdivision. We have assigned Action No. SPA-2005-00801 to this activity. To avoid delay, please include this number in all future correspondence concerning this project.

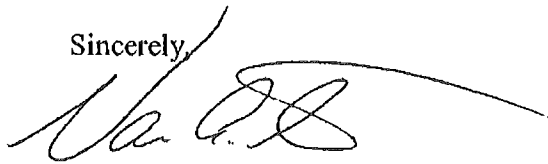

I reviewed this project site in accordance with Section 404 of the Clean Water Act (CWA) and coordinated the jurisdictional determination with EPA. Under Section 404, the Corps regulates the discharge of dredged and fill material into waters of the United States, including wetlands. Based on your description of the site, other information available to us, and current regulations and policy, we have determined that this site does not contain any jurisdictional waters of the U.S.. Therefore, it will not require Department of the Army authorization under the above laws. However, it is incumbent upon you to remain informed of any changes in the Corps Regulatory Program regulations and policy as they relate to your project.

You may accept or appeal this approved JD or provide new information in accordance with the Notification of Administration Appeal Options and Process and Request for Appeal (NAAOP-RFA). This form is available at http://www.spa.usace.army.mil/reg/Administrative%20Appeals/appeals_process.asp. If you elect to appeal this approved JD, you must complete Section II (Request For Appeal or Objections to an Initial Proffered Permit) of the form and return it to the Army

Engineer Division, South Pacific, CESP-D-PDS-O, Attn: Tom Cavanaugh,
Administrative Appeal Review Officer, 1455 Market Street, Room 1760, San Francisco,
CA 94103-1399 within 60 days of the date of this notice. Failure to notify the Corps
within 60 days of the date of this notice means that you accept the approved JD in its
entirety and waive all rights to appeal the approved JD.

If you have any questions concerning our regulatory program, please contact me at
719-543-6915 or by e-mail at Van.A.Truan@usace.army.mil. At your convenience,
please complete a Customer Service Survey on-line available at
<http://per2.nwp.usace.army.mil/survey.html>.

Sincerely,

A handwritten signature in black ink, appearing to read 'Van A. Truan', with a long horizontal flourish extending to the right.

JOB NAME: WATERBURY - PDR
JOB NUMBER: 2359.00
DATE: 11/12/12
CALCULATED BY: MAW

DESIGN POINT **2**

Total Flow: $Q_5 = 9$ cfs
 $Q_{100} = 19$ cfs

(Assume even split of flows at lowpoint for prelim. inlet sizing)

Max. allowable ponding depth:
(Residential street, ramp curb)

$D_5 = 0.50$ ft.
 $D_{100} = 1.00$ ft.

Std. Type R curb inlet detail:

$$Q_i = 1.7(L_i + 1.8(W))(d_{\max} + a)^{1.85}$$

$$W = 2 \text{ ft.}$$

$$a = 3 \text{ in.}$$

$$\text{Clogging Factor} = 1.25$$

$$L_i (1.25) = \text{Length of inlet opening}$$

Curb inlet sizing:

5-Year Event: 8 foot inlet required

100-Year Event: 6 foot inlet required

JOB NAME: WATERBURY - PDR
JOB NUMBER: 2359.00
DATE: 11/12/12
CALCULATED BY: MAW

DESIGN POINT **3**

Total Flow: $Q_5 = 7$ cfs
 $Q_{100} = 14$ cfs

(Assume even split of flows at lowpoint for prelim. inlet sizing)

Max. allowable ponding depth:
(Residential street, ramp curb)

$D_5 = 0.50$ ft.
 $D_{100} = 1.00$ ft.

Std. Type R curb inlet detail:

$$Q_i = 1.7(L_i + 1.8(W))(d_{\max} + a)^{1.85}$$

$$W = 2 \text{ ft.}$$

$$a = 3 \text{ in.}$$

$$\text{Clogging Factor} = 1.25$$

$$L_i (1.25) = \text{Length of inlet opening}$$

Curb inlet sizing:

5-Year Event: 6 foot inlet required

100-Year Event: 4 foot inlet required

JOB NAME: WATERBURY - PDR
JOB NUMBER: 2359.00
DATE: 11/12/12
CALCULATED BY: MAW

DESIGN POINT **4**

Total Flow:

Q_5	=	11	cfs
Q_{100}	=	23	cfs

*Max. allowable ponding depth:
(Residential street, ramp curb)*

- A) Basin Maximum Side Slopes
(Horizontal distance per unit vertical, 4:1 or flatter preferred)

Z = 4.00 ft / ft

4. Inlet

- A) Describe means of providing energy dissipation at concentrated inflow locations:

Time of Duration (Modified Rational, Critical)	0.250 hours

[1]			[2]		
Time of Concentration (Modified Rational, Composite)	0.218	hours	Time of Duration (Modified Rational, Critical)	0.250	hours
Intensity (Modified Rational, Peak)	6.594	in/h	Intensity (Modified Rational, Critical)	6.160	in/h
Flow (Modified Rational, Peak)	31.50	ft ³ /s	Flow (Modified Rational, Critical)	29.43	ft ³ /s
[3]			[5]		
First Outflow Breakpoint (Modified Rational, Method T)		0.283 hours	Storage (Modified Rational, Estimated)	0.104	ac-ft
Flow (Modified Rational, Allowable)		25.00 ft ³ /s			
[4]			[5]		
Second Outflow Breakpoint (Modified Rational)	0.263	hours			
Flow (Modified Rational, Allowable)	25.00	ft ³ /s
