PREPARED FOR

Falcon Area Water and Wastewater Authority

REVISION SEPTEMBER 11, 2024

Project Number W0242.22001

EXECUTIVE SUMMARY

This report is a submittal for Retreat at PrairieRidge Filings 1-3 Preliminary Plan.. The land is to be provided central water and sewer services through the Falcon Area Water and Wastewater Authority (FAWWA), which will become the overall service entity for, not only Sterling Ranch, but also the Retreat and the future Ranch.

It is expected that an urban residential home the Falcon Area Water and Wastewater Authority will require an average of 0.353 annual acre-feet, which is the adopted user characteristic for FAWWA. This is consistent with historic needs for nearby developments. Note that for the smaller high-density lots, FAWWA has adopted an SFE equivalency ratio to account for substantially reduced water needs, although this is partially offset by estimation of common area irrigation needs.

Retreat at PrairieRidge Filings 1-3 Preliminary Plan includes 193 lots, 24 of which fall into high-density development ratios for small lots, and roughly 3.30 annual acre-feet of water set aside for irrigated landscaping.

The resulting water demand on the central water system is 70.93 acre-feet.

The total 300 year water supply for FAWWA is shown in Table 3 and totals 1962.23 annual acre-feet _{300 year}. Appendix F is an accounting of active water commitments, which total 1033.87 acre-feet including all subdivisions committed through September 11, 2024.

This leaves a net excess of currently available water of 928.36 AF_{300 year} and therefore there is more than sufficient water supply to meet the needs of Retreat at PrairieRidge Filings 1-3 Preliminary Plan on the 300-year basis.

Highlights of this Revision;

- **6 Large lots on central water**
- **Pending Case 24 CW 3007 withheld from Water Supply**

1.0 INTRODUCTION

The purpose of this study is to provide a preliminary outline of the water resources and wastewater needs that would be necessary for the Retreat at PrairieRidge Filings 1-3 Preliminary Plan development.

1.1 NEW DEVELOPMENT DESCRIPTION

The Retreat at PrairieRidge Filings 1-3 Preliminary Plan development is located east of Vollmer Road and north of Woodmen Road. This 108.89 acre area will include 193 single family lots.

Appendix A contains the *Overall Service Area Map* for FAWWA,

Appendix B contains the proposed Retreat at PrairieRidge Filings 1-3 Preliminary Plan

2.0 PROJECTION OF WATER NEEDS

2.1 ANALYSIS OF WATER NEEDS

It is expected that the residential lots on central water will be developed with single-family housing with anticipated turf grass landscaping.

For the last five years, there has been a trend in land use that provides for much smaller lots and much denser development in certain areas. Lots smaller than 7,000 square feet are anticipated in certain areas. This is resulting in much lower water needs for these types of developments. The standard SFE adopted in Sterling Ranch has been 0.353 annual acre-feet. However, this is for the formerly typical household anticipating 1500 square feet or more of landscaping. In order to adjust for such increases in density, we are adopting a scaled down equivalency to meet the changes in lot sizes. For instance, lot areas less than 3500 sf have reduced water use that roughly is equivalent to apartments or townhomes where water use is indoor only.

Based on data from other areas, we have established a SFE equivalency factor scale as follows for these smaller lot sizes;

Table 1. SFE Equivalency for High Density Lots

Lot Size	SFE Ratio	Effective Annual Demand
Lots < 2000 SF	0.65	0.23
Lots < 3500 SF	0.75	0.265
Lots < 7000 SF	0.90	0.318
Lots > 7000 SF	1.0	0.353

Retreat at PrairieRidge Filings 1-3 Preliminary Plan has irrigated areas within the common areas or tracts that total roughly 1.32 acres. The landscaping plan specifies a Park on Tract B that we estimate to require 57,636 SF of active or permanent active irrigated landscaping.

Using the above criteria, there are 24 lots in the <7000 SF category and 169 lots in the >7000 SF category. The expected water demands are shown in Table 2 following:

Table 2. Projected Water Demands for Retreat at PrairieRidge Filings 1-3

# of Units	Land Use	Water Use Per Unit (AF/Unit)	Annual Demand (AF)	Average Daily Flow (ADF) (GPD)	Maximum Daily Flow (MDF) (@2.45 x ADF) (GPD)	Peak-Hour Flow (@ 1.5x MDF) (GPM)
0	Residential < 2000 SF	0.23	0	0	0	0
0	Residential < 3500 SF	0.265	0	0	0	0
24	Residential < 7000 SF	0.318	7.632	6813	16,693	17
169	Residential > 7000 SF	0.353	59.995	53560	131,222	137
1.32	Acres-Active Net Irrigation	2.5	3.30	2946	7218	8
Total			70.93	63,319	155,132	162

The total annual demand of the subdivision is 70.93 AF.

NOTE ON POSSIBLE FUTURE ALTERNATE WATER SUPPLY

This report bases all water supply for this subdivision on the central water system. It is noted that FAWWA has a pending water case 24 CW 3007, that would provide augmentation for six single family wells that might be used in the future as an alternate supply. If and when that case is complete, FAWWA may wish to apply to the County to shift water supply for six rural size lots in this subdivision to single family wells. Such shift would be insubstantial in terms of overall FAWWA supply and demand as it would represent less than 0.1 % of FAWWA overall supply and demand. If so, 5 of the lots will be served with new wells and 1 existing lot will continue to be provided service through its existing well which will be re-permitted after case approval. FAWWA will set aside an additional 2.6 annual acre-feet for augmented NNT Dawson water for the 5 new wells and one existing well. Additionally, FAWWA will reserve 4.8 Annual AF of LFH water for post pumping depletions for the five new wells.

3.0 WATER RIGHTS AND SYSTEM FACILITIES

3.1 WATER RIGHTS

Water rights adjudications have been decreed by the State of Colorado, Water Division 2 District Court, Water Division 1 District Court, and the Colorado Groundwater Commission. The comprehensive rights for the FAWWA service include both decrees and determinations. Local groundwater rights are associated with the service area components, Sterling, Retreat, and Prairie Ridge. Each of these sites has existing decrees and/or determinations outlining the rights associated with the development lands.

Both the water decrees and determinations are included in **Appendix C** as well as the deeds for the water.

Table 3 on the following page details all of the water rights currently available for the FAWWA service area which now total 1962.23 acre-feet_{300 year}.

3.2 ADEQUACY OF WATER RIGHTS CURRENT SUPPLY

The current water rights inventory by area is as follows:

/ Sterling original on-site non-tributary (NT) water rights		399.80 AF _{300 year}
/ 02 CW 3059		283.16 AF _{300 year}
/ Retreat at Timber Ridge on-site rights –		42.76 AF _{300 year}
/ Jaynes/Rhetoric (07 CW56; 23CW3009) –		32.20 AF _{300 year}
/ McCune	BD-1689, BD-1690, BD-1691	391.33 acre-feet _{300 year}
/ Bar-X Ranch	85CW-445 and 93 CW-018	592.78 acre-feet _{300 year}
/ Shamrock West	85 CW 131	220.10 acre-feet _{300 year}

FSAWWA-owned and currently available on-site NT and adjudicated not non-tributary (NNT) water totals are 1962.23 AF_{300 year}, which would be adequate supply to meet the needs of roughly 5,500SFE.

As of this report September 11, 2024, the total water commitment within FAWWA requires **1033.87** AF_{300 year}. See Appendix F – FAWWA detailed Water Supply vs Current Water Commitments.

This leaves a net excess of currently available water of 928.36 AF_{300 year} and therefore there is more than sufficient water supply to meet the needs of Retreat at PrairieRidge Filings 1-3 Preliminary Plan on the 300-year basis.

3.3 MASTER PLANNING AND LONG-TERM AND FUTURE SOURCES OF SUPPLY

The FAWWA water system has only been in operation for five years, so little-to-no usable historic information would be reliable for unique, long-term planning. However, substantial nearby data from the Falcon area is available for use. As of the end of 2023, the system had approximately only 500 active users. Therefore, initial projections have been based on area-wide water user characteristics and a linear buildout rate. This rate is considered to be an average annual rate that might be reasonably maintainable over a 10-year period. The average growth rate is projected as 180 units added per year.

- / **2040 Scenario:** Based on the above factors, the FAWWA system might conservatively anticipate serving 3,710 SFEs in the year 2040. This number is a FAWWA service area projection. This would require no additional water.
- / **2060 Scenario:** Based on the same factors, the FAWWA system might be expected to serve 7,310 SFEs within its expanded service area, which includes all service area components.. This would be substantially greater than the actual Sterling Ranch. The annual acre-foot requirement might be 640 annual AF, but supply would include water from The Ranch which has not yet been added to inventory.

In addition to adding off-site sources, potential, additional supplies include renewable resources and/or regional projects bringing new water to the area

Long-Term Planning: Future water supply has already been contracted for and plans for implementation are underway. The first project recently completed provides augmentation for certain on-site NNT water, so that that water may be used in existing and expanded well fields on-site.

1. **Regionalization Opportunities:** FAWWA's main supply source is centralized at a point that both Cherokee Metropolitan District and Woodmen Hills Metropolitan District have adjacent major storage and delivery facilities. There are currently no arrangements in place to make connections, but in the future, FAWWA may seek to have interconnections and possibly share supply.

The second element is a much broader regionalization: conducting cooperative actions with Colorado Springs Utilities (CSU), which FAWWA has been open to. CSU is potentially also open to shared physical facility utilization, which would enable Sterling to expand its scope in seeking water rights. While it is not expected that Sterling will provide actual water, the access to facilities opens greater doors for FAWWA.

2. **Indirect, Reuse, Lawn Irrigation Return Flows (LIRF) Credits, Aquifer Storage/Recharge, and Direct Reuse:** Regarding return flows, initial development is being planned around sourcing available physical supplies. These supplies are all fully-consumable and ultimately result in potential return-flow capabilities. Since FAWWA wastewater is discharged to the Meridian system, which in turn has the potential to convert some reusable flows to available physical supplies, those options will be available and considered by Sterling. With regard to LIRF credits, Sterling has already initiated a case that will make augmentation use of its potential LIRF credits.

3.4 SYSTEM INTERCONNECTS

FAWWA currently has no system interconnections. However, as discussed previously, FAWWA's main supply source is centralized at a point that both Cherokee Metropolitan District and Woodmen Hills Metropolitan District have adjacent major storage and delivery facilities. It is possible that future agreements could be made.

3.5 SOURCE OF PHYSICAL SUPPLY

Municipal water demand would be met using primarily Arapahoe and Laramie-Fox Hills formation wells in the FAWWA area. Two on-site wells are active and three more have been completed, awaiting equipping. Existing well permits are included in **Appendix D**.

FAWWA has begun the process of filing to drill the first set of wells on the McCune site which will possibly be needed in 2027.

Off-site water to the north of the FAWWA service area is generally in the Denver and Arapahoe formations.

3.6 WATER QUALITY AND TREATMENT

Appendix E contains the water quality reports for the initial wells drilled at FAWWA. The quality is generally consistent with Denver Basin water typically encountered in the Falcon area. The quality of water in these aquifers in this area has typically been suitable for potable use with the addition of iron and manganese treatment.

3.7 WATER STORAGE, DISTRIBUTION, AND TRANSMISSION LINES

An initial 1.0-million-gallon tank has already been constructed at the FAWWA site.

For the purpose of fire protection, we recommend eight-inch lines throughout the residential subdivision. The lines should be looped wherever the street layout allows. A transmission line of 24-inches in diameter has been extended south-southwesterly along one of the major roadways from the storage tank into Phase One of the development.

3.8 PUMPING FOR SERVICE PRESSURES

Ground elevations within the development service area range from approximately 6,970 feet to 7,320 feet. Adequate service pressures are generally considered 60 psi for residential service. The tank site is on the Sterling property at a base elevation of approximately 7,310 feet, which would be capable of supplying acceptable service pressures to ground elevations of approximately 7,190 feet. Initial development is anticipated to be at elevations below 7,190 feet, so the tank site will be able to provide adequate pressure.

Development construction has progressed such that the pressure system is likely to be needed sometime in 2023, FAWWA is currently constructing the pressure pump station so that it will be ready when needed next year.
