DRAINAGE STATEMENTS

Engineer's Statement:

The attached drainage plan and report were prepared under my direction and supervision and are correct to the best of my knowledge and belief. Said drainage report has been prepared according to the criteria established by the County for drainage reports and said report is in conformity with the master plan of the drainage basin. I accept responsibility for liability caused by negligent acts, errors or omissions on my part in preparing this report.

John P. Schwab, P.E. #29891

Developer's Statement:

I, the developer have read and will comply with all of the requirements specified in this drainage report and plan.

**MONUMENT ACADEMY
FINAL DRAINAGE REPORT - EXECUTIVE SUMMARY**

A. Background

- Monument Academy is planning to construct a new Middle School / High School campus on approximately 21.2 acres of the vacant 64.1-acre parcel at the southeast corner of SH83 and Walker Road.
- 83 Walker LLC has future plans for development of the balance of the property with a mixture of commercial and residential land uses.
- The project site is located near the upstream limit of the West Cherry Creek Drainage Basin, which comprises a total drainage area in excess of 30 square miles.

B. General Drainage Plan

- Developed drainage will be conveyed to suitable outfalls through paved parking areas with curb and gutter, streets with roadside ditches, storm sewer facilities, and drainage channels.
- Developed flows from the site will be detained to historic levels through on-site stormwater detention and water quality ponds.

C. Drainage Impacts

- Drainage facilities will be designed and constructed to El Paso County standards.
- Drainage facilities within public road rights-of-way will be dedicated to the County for maintenance. The proposed stormwater detention ponds will be privately owned and maintained by the Property Owners Association.
- The proposed detention ponds will release historic flows at the downstream property boundaries, ensuring no significant adverse drainage impact on downstream properties.

I. GENERAL LOCATION AND DESCRIPTION

A. Background

Monument Academy is planning to construct a new school campus on a 64.1-acre property located at the southeast corner of State Highway 83 (SH83) and Walker Road in northern El Paso County, Colorado (see Figure A1, Appendix F). The proposed school site is a vacant, unplatte property (El Paso County Assessor's Parcel No. 61000-00-245). The site is zoned Rural Residential (RR-5), and the proposed school is a permitted use.

Monument Academy is planning to construct the new school campus on approximately 21.2 acres in the northeasterly part of the property. 83 Walker LLC has future plans for development of the balance of the 64.1-acre property with a mixture of commercial and residential land uses. Site development activities will include site grading, utilities, a new school building, internal roads, parking lots, landscaping, and related site improvements.

Monument Academy, a Colorado Charter School authorized by the Lewis-Palmer School District No. 38, desires to construct a new middle/high school serving grades 6-12. The school intends to open in the fall of 2020 with approximately 480 students and anticipates growing its enrollment to 1,000 students at full build out. The school, as proposed, would consist of a two-story building of approximately 55,000 SF built in phase one, and an additional 30,000 SF to be constructed in a future phase. The school will contain all customary program spaces such as academic spaces, athletic and gymnasium spaces, band, vocal music, art, drama and typical support spaces such as administrative and counseling spaces. While most of these functions would be constructed in the first phase, the second phase would likely expand the athletic and performance arts spaces including a multi-purpose performance venue.

In addition to the school functions, the YMCA of the Pikes Peak Region, the largest non-profit community support organization serving El Paso County, proposes to occupy approximately 12,000 SF of phase one space that would be co-located with the school. The YMCA program would consist of athletic spaces such as a healthy living center, group exercise class space, personal training, and other similar functions. As with the school, the YMCA would also require typical support spaces for administrative, child care, and other functions. As with the school, the YMCA envisions constructing their program space in phases, and phase two could include an expanded healthy living center, additional group exercise spaces, and potentially a competition aquatics venue. If all these envisioned uses are eventually constructed, future phases would total approximately 40,000 SF of additional space.

Primary access to the site will be provided by a new roadway extending south from Walker Road into the site. Based on the Traffic Study and coordination with CDOT, a roundabout is proposed at intersection of Walker Road and the new north-south roadway entering the site. An additional right-in; right-out access is planned to extend from State Highway 83 easterly into the site. This access will extend east-west across the property, connecting with the future extension of Pinehurst Circle planned through the adjoining Walden Preserve 2 PUD southeast of the school

site. Both the north-south and east-west access roads will be constructed with the ultimate intention of dedication as public rural collector roadways in conjunction with a future subdivision application.

B. Scope

In support of the El Paso County Site Development Plan and Minor Subdivision Plat submittals for this project, this report is intended to meet the requirements of a Master Development Drainage Plan (MDDP) and Final Drainage Report (FDR) in accordance with El Paso County drainage criteria. This report will provide a summary of site drainage issues impacting the proposed development. The report will analyze impacts from upstream drainage patterns, site-specific developed drainage patterns, and impacts on downstream facilities. This report is based on the guidelines and criteria presented in the City of Colorado Springs and El Paso County "Drainage Criteria Manual."

This Final Drainage Report provides final drainage analysis and design for the Monument Academy campus and associated public road improvements. Additional Final Drainage Reports will be required in support of detailed development plans for the anticipated future commercial and residential development areas.

C. Site Location and Description

The property is described as the East Half of the Northwest Quarter of Section 15, Township 11 South, Range 66 West of the 6th Principal Meridian, with exceptions as detailed in the legal description. The site has historically been a vacant forest and meadow tract.

The Monument Academy parcel is bordered by Walker Road to the north, State Highway 83 to the west, a rural residential parcel to the south, and the existing Walden Wastewater Treatment Facility to the east. The adjoining property to the north, west, and south is zoned rural residential (RR5).

The east boundary of the site adjoins the Walden Preserve 2 PUD. The Walden Preserve PUD and adjoining Walden Subdivision (Zoned RR1) include a range of 0.5-acre to 1-acre residential lots served by the Walden central water and wastewater systems.

Ground elevations within the parcel range from a low point of approximately 7,365 feet above mean sea level at the southwest corner of the property to a high point of 7,440 feet along the ridge within the site.

Surface drainage from this site flows into tributary channels draining to the main channel of West Cherry Creek. The terrain is rolling with slopes ranging from 1% to 10%. Existing vegetation is typical eastern Colorado prairie grass in the meadow areas and evergreen pines in the forest areas.

D. General Soil Conditions

According to the Soil Survey of El Paso County prepared by the Soil Conservation Service, the majority of the parcel is classified as “Tomah-Crowfoot” series loamy sands, and characterized as hydrologic soils group B. On-site soils are comprised primarily of the following soil types (see Appendix A):

- Type 26 – “Elbeth sandy loam”: slow to medium surface runoff, moderate erosion hazard (Hydrologic group B)
- Type 71 – “Pring coarse sandy loam”: medium surface runoff, moderate erosion hazard (Hydrologic Group B)
- Type 92 - “Tomah-Crowfoot loamy sands”: slow surface runoff, slight to moderate erosion hazard (Hydrologic Group B)

II. DRAINAGE BASINS AND SUB-BASINS

A. Major Basin Description

The proposed development lies within the West Cherry Creek Drainage Basin (CYCY 0400) as classified by El Paso County. Drainage from the east side of this site flows northerly to an eastern tributary of West Cherry Creek, which flows to a confluence with the main channel north of Walker Road. Drainage from the west side of this site flows westerly to several culverts crossing SH83, and then flowing northwesterly to the main channel of West Cherry Creek. Downstream agricultural areas generally drain northerly towards the main channel of West Cherry Creek.

The major drainage basins lying in and around the proposed development are depicted in Figure EX1. The Walden area is located near the southerly limits of the West Cherry Creek Basin, which comprises a total drainage area in excess of 30 square miles.

B. Floodplain Impacts

The proposed development area is located beyond the limits of any 100-year floodplain delineated by the Federal Emergency Management Agency (FEMA). The floodplain limits in the vicinity of the site are shown in Flood Insurance Rate Map (FIRM) Number 08041C0285G dated December 7, 2018, as shown in Figure FM1 (Appendix F). As shown on Figure FM1, the FEMA floodplain limit extends slightly south of Walker Road in the vicinity of the existing culvert crossing east of this site.

C. Sub-Basin Description

The existing drainage basins lying in and around the proposed development are depicted in Figure EX1 and EX2 (Appendix F). The property is located along a ridge, so there are no significant off-site drainage basins impacting the site. The existing on-site topography has been delineated as four drainage basins. Basin C14 drains northeasterly to a tributary channel of West Cherry Creek which crosses Walker Road east of the site. Basins M1-M3 drain westerly to existing culverts crossing SH83 and flowing northwesterly to the main channel of West Cherry Creek.

The developed drainage basins lying within the proposed development are depicted on Figure D1 (Appendix F). The interior site layout has been divided into drainage basins based on the site layout and proposed topography. The natural drainage patterns will be impacted through development by site grading and concentration of runoff in roadside ditches and channels. Developed flows will be routed through on-site stormwater detention ponds designed to release historic flows to the existing downstream culverts.

See drainage plan
redlines.

III. DRAINAGE DESIGN CRITERIA

A. Development Criteria Reference

No Drainage Basin Planning Study (DBPS) has been completed for the West Cherry Creek Drainage Basin. JPS Engineering, Inc. prepared the “Master Development Drainage Plan (MDDP) and Preliminary Drainage Report for Walden Preserve 2 PUD” dated September 17, 2014, which was approved by El Paso County on November 6, 2014 in support of the Walden Preserve 2 PUD and Preliminary Plan.

B. Hydrologic Criteria

Recognizing that all tributary drainage basins impacting this site are less than 100 acres, Rational Method procedures were utilized for calculation of peak flows within the on-site drainage basins. Rational Method hydrologic calculations were based on the following assumptions:

| | | |
|--|----------------------------|-------------|
| • Design storm (minor) | 5-year | |
| • Design storm (major) | 100-year | |
| • Rainfall Intensities | El Paso County I-D-F Curve | |
| • Hydrologic soil type | B | |
| | <u>C5</u> | <u>C100</u> |
| • Runoff Coefficients - undeveloped: | | |
| Existing meadow areas | 0.08 | 0.35 |
| • Runoff Coefficients - developed: | | |
| Proposed buildings / pavement areas | 0.90 | 0.96 |
| Future neighborhood business areas | 0.49 | 0.62 |
| Future residential areas (0.5-acre lots) | 0.22 | 0.46 |
| Future residential areas (1-acre lots) | 0.20 | 0.44 |

Hydrologic calculations are detailed in Appendix B, and peak design flows are identified on the drainage plan drawings in Appendix F.

IV. DRAINAGE PLANNING FOUR STEP PROCESS

El Paso County Drainage Criteria require drainage planning to include a Four Step Process for receiving water protection that focuses on reducing runoff volumes, treating the water quality capture volume (WQCV), stabilizing drainageways, and implementing long-term source controls. The Four Step Process is applicable to all new and re-development projects with construction activities that disturb 1 acre or greater or that disturb less than 1 acre but are part of a larger common plan of development. The Four Step Process has been implemented as follows in the planning of this project:

Step 1: Employ Runoff Reduction Practices

- Minimize Impacts: The proposed school development includes significant open space, play areas, and a future athletic field, resulting in a moderate level of impervious site development. The proposed school campus development generates less impervious area and less intensive drainage impacts in comparison to multi-family residential, commercial, or industrial land uses.
- Minimize Directly Connected Impervious Areas (MDCIA): The Walden community has developed as a rural residential development with roadside ditches along subdivision roads, providing for impervious areas to drain across pervious areas. Based on the roadside ditches throughout the subdivision, the subdivision is classified as MDCIA Level One.
- Reduce Pavement Area: The proposed school site layout has been designed to provide pavement areas as required to meet the functional needs of the school campus while minimizing excessive paved areas.
- Grass Swales: The proposed drainage plan incorporates roadside ditches and grass-lined swales in selected locations to encourage stormwater infiltration while providing positive drainage through the site.

Step 2: Stabilize Drainageways

- Proper erosion control measures will be implemented along the roadside ditches and grass-lined drainage channels to provide stabilized drainageways within the site.

Step 3: Provide Water Quality Capture Volume (WQCV)

- Detention Ponds: The developed site will drain through stormwater detention ponds which will capture and slowly release the WQCV over an extended release period.

Step 4: Consider Need for Industrial and Commercial BMPs

- No industrial land uses are proposed within this development. Future commercial development areas will need to consider the potential need for Commercial BMPs.
- On-site drainage will be routed through private detention ponds to minimize introduction of contaminants to the County's public drainage system.

V. GENERAL DRAINAGE RECOMMENDATIONS

The developed drainage plan for the site is to provide and maintain positive drainage away from structures and conform to the established drainage patterns for the overall site. JPS Engineering recommends that positive drainage be established and maintained away from all structures within the site in conformance with applicable building codes and geotechnical engineering recommendations.

Site grading and drainage improvements performed as a part of subdivision infrastructure development includes overlot grading and subdivision drainage improvements depicted on the subdivision construction drawings. Individual lot grading is the sole responsibility of the

individual builders and property owners. Final grading of each home site should establish proper protective slopes and positive drainage in accordance with HUD guidelines and building codes. In general, main floor elevations for each home should be established approximately 2 feet above the top of curb of the adjoining street.

In general, we recommend a minimum of 6 inches clearance from the top of concrete foundation walls to adjacent finished site grades. Positive drainage slopes should be maintained away from all structures, with a minimum recommended slope of 5 percent for the first 10 feet away from buildings in landscaped areas, a minimum recommended slope of 2 percent for the first 10 feet away from buildings in paved areas, and a minimum slope of 1 percent for paved areas beyond buildings.

VI. DRAINAGE FACILITY DESIGN

A. General Concept

Development of the Monument Academy site will require site grading and paving, resulting in additional impervious areas throughout the site. The general drainage pattern will consist of grading away from building sites to a system of drainage swales, storm sewers, and roadside ditches conveying runoff flows through the site.

The stormwater management concept for the Monument Academy development will be to provide a system of storm sewers, roadside ditches, and grass-lined swales as required to safely convey developed drainage through the site to on-site detention ponds, discharging to the existing natural outfalls. Grading of individual development sites will provide positive drainage away from buildings and direct developed flows into the system of storm sewers, roadside ditches, and drainage swales running through the subdivision.

B. Specific Details

1. Existing Drainage Conditions

Historic drainage conditions within the site are depicted on Figure EX1 and EX2. The Monument Academy site is located along a north-south ridge along the east side of SH83, so there are no significant off-site drainage basins impacting the site. Surface drainage from the site generally flows northerly to tributary channels feeding into West Cherry Creek.

The northeasterly part of the site has been delineated as Basin C14, which sheet flows northeasterly to Design Point #C14 at the northeast corner of the property, with historic peak flows calculated as $Q_5 = 3.9$ cfs and $Q_{100} = 28.9$ cfs. Drainage from Design Point #C14 continues flowing easterly across the adjoining Walden Wastewater Treatment Facility site to an existing culvert crossing Walker Road at the northern boundary of the Walden property. According to the Master Development Drainage Plan for Walden Preserve 2 PUD," historic peak flows at the existing culvert crossing Walker Road have been calculated as $Q_5 = 222.5$ cfs and $Q_{100} = 582.9$ cfs (SCS

Address capacity of this culvert
and the upstream driveway
culvert.

Method), so the contribution of flow from Monument Academy Basin C14 to this design point is negligible.

The westerly and southerly part of the site has been delineated as Basins M1-M4, flowing westerly to existing culverts crossing SH83 and Walker Road. Basin M1 comprises the northwest corner of the property, which sheet flows northwesterly to Design Point #M1, with historic peak flows calculated as $Q_5 = 1.6$ cfs and $Q_{100} = 11.5$ cfs. An existing 18-inch CMP culvert conveys the flow from Design Point #M1 northerly across Walker Road.

split for each culvert

Basin M3 ~~comprises~~ the middle area on the west side of the property, which sheet flows to existing culverts crossing SH83. Historic peak flows at Design Point #M3 are calculated as $Q_5 = 4.4$ cfs and $Q_{100} = 32.1$ cfs. Existing 18-inch CMP and 24-inch CMP culverts convey the flow from Basin M3 westerly across SH83.

Basin M4 comprises the south end of the property, which sheet flows to the southwest corner of the site. Historic peak flows at Design Point #M4 are calculated as $Q_5 = 4.7$ cfs and $Q_{100} = 34.5$ cfs. An existing 24-inch CMP culvert conveys the flow from Basin M4 westerly across SH83.

2. Developed Drainage Conditions

Address culvert capacity and
headwater for each culvert.

As shown on the enclosed Developed Drainage Plan (Figure D1, Appendix F), the property has been delineated as five on-site drainage basins flowing across the property. Developed flows have been calculated based on the impervious areas associated with the proposed building and parking areas and anticipated future land uses.

Hydrologic calculations for the school site are detailed in the attached spreadsheets (Appendix B), and peak flows are identified on Figures EX1 and D1 (Appendix F).

a) School Campus

The majority of the school site has been delineated as Basins C14 and M2. Basin C14 drains northeasterly across the property to a proposed stormwater detention pond at the northeast corner of the site. Basin M2 drains westerly across the site to a proposed stormwater detention pond along the western boundary of the property.

The proposed school building pad will be graded with protective slopes to provide positive drainage away from the building. Private storm sewer systems will be extended across the parking areas, and site grades around the school campus will slope to storm inlets at selected locations, collecting surface drainage and conveying stormwater to the proposed extended detention basins (EDB).

Basin C14

The northeasterly part of the developed School Site has been delineated as Basin C14, which will flow northeasterly to Design Point #C14 following historic drainage patterns. Developed peak flows at Design Point #C14 are calculated as $Q_5 = 15.7 \text{ cfs}$ and $Q_{100} = 44.8 \text{ cfs}$. An 18"-24" storm sewer system will collect surface drainage from Basin C14 and convey developed flows northeasterly to Detention Pond C14 at the northeast corner of the site.

Describe pond inflow/outflow and volume attributes.

The east edge of the southerly parking lot will flow northeasterly to Private Storm Inlet C14.1 (10' Type R Inlet) on the east side of the school building. Private Storm Sewer C14.1 (18" HDPE) will convey the flow from Inlet C14.1 northerly to Private Storm Inlet C14.2 at the northeast corner of the northerly parking lot.

Private Storm Sewer C14.2 (24" HDPE) will convey the flow from Inlet C14.2 northerly to Private Inlet C14.3 (Type C) on the north side of the athletic field. Private Storm Sewer C14.3 (24" HDPE) will convey the flow from Inlet C14.3 easterly into Private Detention Pond C14. Stormwater detention and water quality will be provided by routing developed flows through Detention Pond C14.

Basin M2

The southwesterly part of the developed School Site has been delineated as Basin M2, which flows westerly across the south parking lot to Design Point #M2, with developed peak flows calculated as $Q_5 = 19.4 \text{ cfs}$ and $Q_{100} = 40.0 \text{ cfs}$. An 18"-24" storm sewer system will collect surface drainage from Basin M2 and convey developed flows westerly to a grass-lined channel on the west side of "Road A" flowing to Detention Pond M3 at the western property boundary. While no initial development is proposed within Basin M3, Detention Pond M3 has been sized to account for future commercial development of Basin M3 as well.

for volume requirements (?)

The majority of the east side of the southerly parking lot will flow northwesterly to Inlet M2.1 (10' Type R Inlet) on the south side of the school building. Storm Inlet M2.1 will intercept surface drainage from the southeasterly parking lot, and roof drains from the south side of the building will flow into a roof drain collection line feeding into Storm Sewer M2.1. Private Storm Sewer M2.1 (18" RCP) will convey the flow from Inlet M2.1 to Public Inlet M2.3 (Type D) within the roadside ditch southwest of the school building.

Public Storm Inlet M2.2 will intercept flow from the roadside ditch at the northeast corner of Pinehurst Circle and "Road A", and Public Storm Sewer M2.2 (18" RCP) will convey this flow northerly to the junction Inlet M2.3. Public Storm Sewer M2.3 (30" RCP) will convey the combined flow from Inlet M2.3 westerly across "Road A" to daylight in an open channel flowing northwesterly into Private Detention Pond M3.

**Address untreated
sub-basins/areas.**

Stormwater detention and water quality will be provided by routing developed flows through Detention Pond M3.

b) Future Development Areas

Basin M1

The northwesterly part of the overall site has been delineated as Basin M1, which flows to Design Point #M1 at the northwest corner of the property. Assuming future commercial development characterized as “neighborhood business,” the future developed peak flows at Design Point #M1 are calculated as $Q_5 = 8.1 \text{ cfs}$ and $Q_{100} = 17.3 \text{ cfs}$. A future detention and water quality pond will be required to mitigate developed drainage impacts at Design Point #M1.

There will be no significant developed drainage impact within Basin M1 during the initial phase of Monument Academy site development.

Basin M3

The central areas on the west side of the property has been delineated as developed Basin M3, which flows westerly to Detention Pond M3. Assuming future commercial development characterized as “neighborhood business,” the future developed peak flows from Basin M3 are calculated as $Q_5 = 18.8 \text{ cfs}$ and $Q_{100} = 42.7 \text{ cfs}$. Flows from Basins B2 and B3 combine at Design Point #M3, with peak flows calculated as $Q_5 = 38.3 \text{ cfs}$ and $Q_{100} = 83.0 \text{ cfs}$. Detention Pond M3 will be constructed with the initial phase of development, so no additional detention will be required for this basin assuming the future development is consistent with the assumptions in this report.

Basin M4

The south end of the overall site has been delineated as Basin M4, which flows to Design Point #M4 at the southwest corner of the property. Assuming future residential development with a mixture of 0.5-acre to 1-acre lot sizes, the future developed peak flows at Design Point #M4 are calculated as $Q_5 = 13.9 \text{ cfs}$ and $Q_{100} = 50.1 \text{ cfs}$. A future detention and water quality pond will be required to mitigate developed drainage impacts at Design Point #M4.

There will be no significant developed drainage impact within Basin M4 during the initial phase of Monument Academy site development.

Provide calculations for this phase and ultimate development.

C. Comparison of Developed to Historic Discharges

Based on the hydrologic calculations in Appendix B, the proposed development will result in developed flows exceeding historic flows from the parcel. The increase in developed flows will be mitigated through on-site stormwater detention facilities.

The comparison of developed to historic discharges at key design points is summarized as follows:

| Design Point | Historic Flow | | | Developed Flow | | | Comparison of Developed to Historic Flow (Q ₅ %/Q ₁₀₀ %) |
|-----------------|---------------|----------------------|------------------------|----------------|----------------------|------------------------|--|
| | Area (ac) | Q ₅ (cfs) | Q ₁₀₀ (cfs) | Area (ac) | Q ₅ (cfs) | Q ₁₀₀ (cfs) | |
| C14 (developed) | 18.3 | 3.9 | 28.9 | 15.9 | 15.7 | 44.8 | 403% / 155% (increase) |
| C14 (detained) | 18.3 | 3.9 | 28.9 | 15.9 | 0.2 | 13.3 | 5% / 46% (decrease) |
| M3 (developed) | 15.0 | 4.4 | 32.1 | 18.8 | 38.3 | 83.0 | 870% / 259% (increase) |
| M3 (detained) | 15.0 | 4.4 | 32.1 | 18.8 | 0.5 | 25.6 | 11% / 80% (decrease) |

D. Detention Ponds

The total developed storm runoff downstream of the site will be maintained at historic levels by routing flows through the proposed detention ponds. Detention Ponds C14 and M3 will be constructed with the initial phase of development, and these ponds have been designed as “full-spectrum” detention ponds to mitigate developed drainage and water quality impacts from the school campus and associated roadway improvements.

The proposed pond outlet structures have been designed as Extended Detention Basins (EDB), providing for a 40-hour release of the WQCV, and outlet structure sizing to maintain maximum allowable release rates from the pond. The detention ponds will have grass-lined bottoms and riprap infiltration zones in front of the pond outlet structures to encourage infiltration of stormwater prior to discharging into the downstream drainage system. Buried riprap spillways will be provided as emergency overflow paths from each pond to the adjoining roadside ditches.

ultimate(?)

Final pond design calculations utilizing the Denver Urban Drainage and Flood Control District (UDFCD) “UD-Detention_v3.07” software package are enclosed in Appendix D1 and D2. Design parameters for the detention ponds are summarized as follows:

| Pond | Tributary Area (ac) | Percent Impervious (%) | Required 100-Year Detention Volume (ac-ft) | Design Volume (ac-ft) |
|------|---------------------|------------------------|--|-----------------------|
| C14 | 15.9 | 27.0% | 1.0 | 1.3 |
| M3 | 18.8 | 61.4% | 2.1 | 2.3 |

Describe how pond outlet structures will be modified with the future development. Analyses for this report should size outlets only for this phase of development.

The proposed detention ponds will be owned and maintained by the Property Owners Association, and maintenance access will be provided from the adjacent parking lots, access drives, and public roads.

State that easements are provided in the PDB/BMP maintenance agreement.

E. On-Site Drainage Facility Design

Developed sub-basins and proposed drainage improvements are depicted on the enclosed Drainage Plan (Sheet D1). On-site drainage facilities will consist of roadside ditches, grass-lined channels, and culverts. Hydraulic calculations for preliminary sizing of major on-site drainage facilities are enclosed in Appendix C, and design criteria are summarized as follows:

1. Culverts

The internal road system will be graded to drain roadside ditches to low points along the road profile, where cross-culverts will convey developed flows into grass-lined channels following historic drainage paths. Culvert pipes have been specified as reinforced concrete pipe (RCP) with a minimum diameter of 18-inches. Final culvert design calculations were performed utilizing the FHWA HY-8 software package to perform a detailed analysis of inlet and outlet control conditions, meeting El Paso County criteria for allowable headwater depths and overtopping. Riprap outlet protection will be provided at all culverts.

Provide analyses for all culverts.

2. Open Channels

Drainage easements will be dedicated along major drainage channels following historic drainage paths through the subdivision. Proposed channel improvements have generally been designed as grass-lined channels designed to convey 100-year flows, with a trapezoidal cross-section, variable bottom width and depth, 4:1 maximum side slopes, one-foot freeboard, and a minimum slope of 0.5 percent.

The proposed drainage channels have been sized utilizing Manning's equation for open channel flow, assuming a friction factor ("n") of 0.030 for dry-land grass channels. Maximum allowable velocities will be evaluated based on El Paso County drainage criteria, typically allowing for a maximum 100-year velocity of 4 feet per second for native grass channels. Erosion control mats have been specified for channel segments with maximum 100-year velocities up to 9 feet per second. The proposed channels will generally be seeded with native grasses for erosion control. Erosion control mats, ditch checks, and/or riprap channel lining will be provided where required based on erosive velocities. Ditch flows will be diverted to drainage channels at the nearest practical location to minimize excessive roadside ditch sizes.

are?

F. Analysis of Existing and Proposed Downstream Facilities

The general concept of the proposed drainage plan is to mitigate developed drainage impacts by routing developed flows through on-site detention ponds. There is no evidence of erosion concerns in the existing natural drainage swales immediately downstream of the site. Recognizing that on-site detention ponds are being constructed to mitigate developed drainage impacts, there is no need for off-site drainage improvements.

Address all culverts.

G. Anticipated Drainage Problems and Solutions

Stormwater detention ponds have been designed to mitigate the impacts of developed drainage from the Monument Academy project. The overall drainage plan for the subdivision includes a system of storm sewer facilities, roadside ditches, channels, and culverts to convey developed flows through the site. The primary drainage problems anticipated within this development will consist of maintenance of these drainage pipes, channels, culverts, and detention pond facilities. Care will need to be taken to implement proper erosion control measures in the proposed roadside ditches, channels, and swales.

See comment letter.

Ditches have been designed to meet maximum allowable velocity criteria. Erosion control mats will be installed where necessary to minimize erosion concerns. Proper construction and maintenance of the proposed detention facilities will minimize downstream drainage impacts.

VII. EROSION / SEDIMENT CONTROL

The Contractor will be required to implement Best Management Practices (BMP's) for erosion control through the course of construction. Sediment control measures will include installation of silt fence at the toe of disturbed slopes and hay bales protecting drainage ditches. Cut slopes will be stabilized during excavation as necessary and vegetation will be established for stabilization of disturbed areas as soon as possible. All ditches will be designed to meet El Paso County criteria for slope and velocity.

VIII. COST ESTIMATE AND DRAINAGE FEES

A cost estimate for proposed drainage improvements is enclosed in Appendix E.

The developer will finance all construction costs for proposed roadway and drainage improvements, and public facilities will be owned and maintained by El Paso County upon final acceptance. The proposed detention ponds will be owned and maintained by the Property Owners Association.

This parcel is located in the West Cherry Creek drainage basin. No drainage and bridge fees will be due at time of recordation of the final plat as the subject site is not located in a fee basin.

IX. SUMMARY

The developed drainage patterns associated with the proposed Monument Academy campus and surrounding site development will remain consistent with historic conditions, and new drainage facilities constructed to El Paso County standards will safely convey runoff to suitable outfalls. Developed flows from the site will drain through on-site stormwater detention ponds prior to discharging to the existing downstream drainage system.

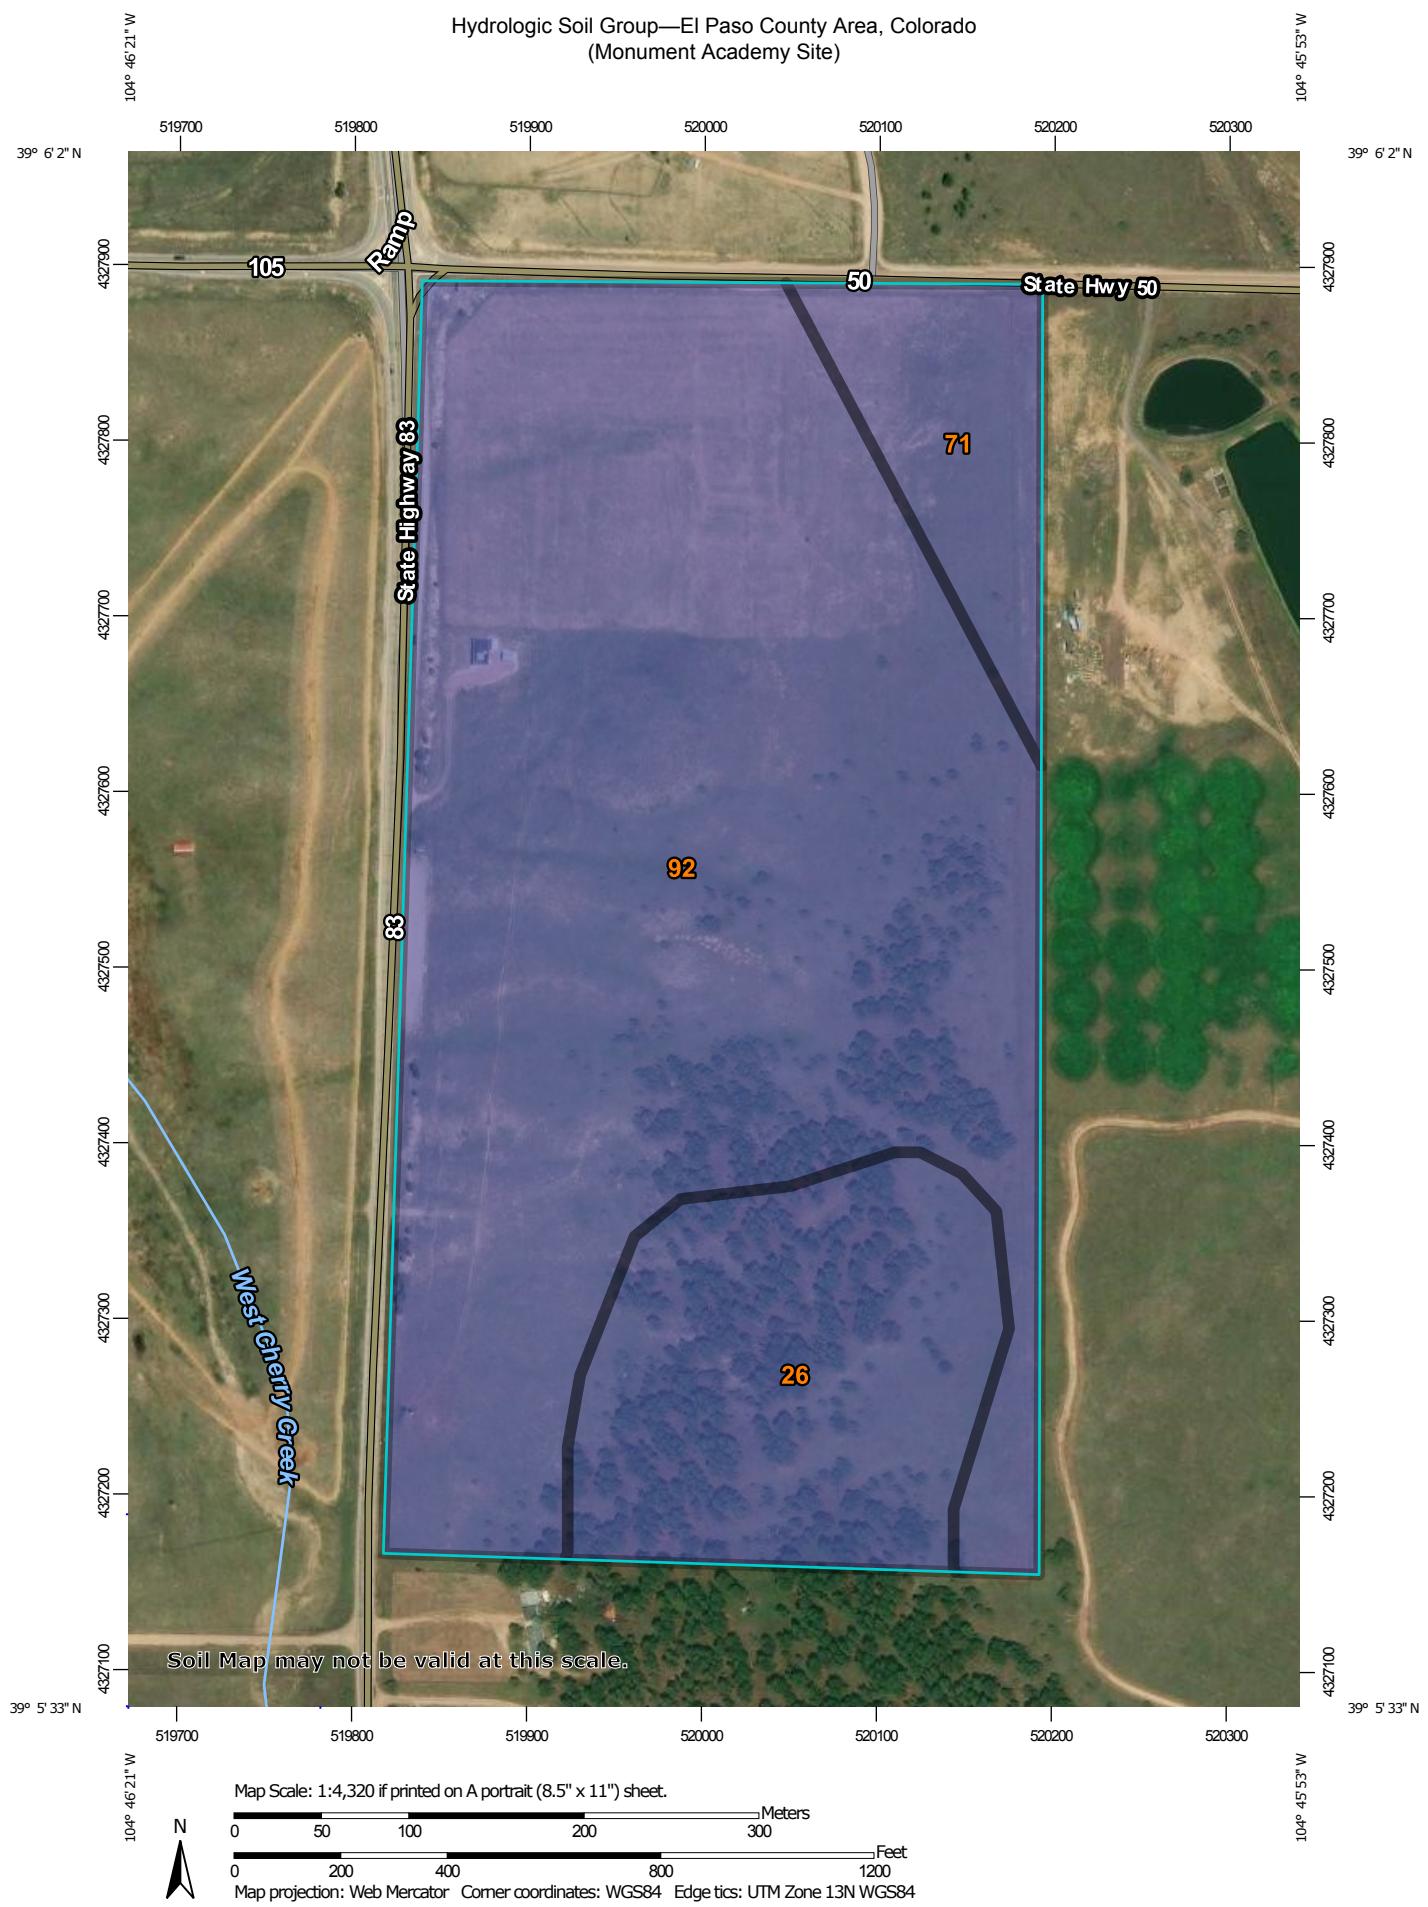

The proposed stormwater detention and water quality facilities have been designed to mitigate developed flow impacts and meet the County's stormwater quality requirements. Construction and proper maintenance of the proposed stormwater facilities and detention basins, in conjunction with proper erosion control practices, will ensure that this developed site has no significant adverse drainage impact on downstream or surrounding areas.

Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

**Custom Soil Resource Report for
El Paso County Area, Colorado**

Preface

Soil surveys contain information that affects land use planning in survey areas. They highlight soil limitations that affect various land uses and provide information about the properties of the soils in the survey areas. Soil surveys are designed for many different users, including farmers, ranchers, foresters, agronomists, urban planners, community officials, engineers, developers, builders, and home buyers. Also, conservationists, teachers, students, and specialists in recreation, waste disposal, and pollution control can use the surveys to help them understand, protect, or enhance the environment.

Various land use regulations of Federal, State, and local governments may impose special restrictions on land use or land treatment. Soil surveys identify soil properties that are used in making various land use or land treatment decisions. The information is intended to help the land users identify and reduce the effects of soil limitations on various land uses. The landowner or user is responsible for identifying and complying with existing laws and regulations.

Although soil survey information can be used for general farm, local, and wider area planning, onsite investigation is needed to supplement this information in some cases. Examples include soil quality assessments (<http://www.nrcs.usda.gov/wps/portal/nrcs/main/soils/health/>) and certain conservation and engineering applications. For more detailed information, contact your local USDA Service Center (<https://offices.sc.egov.usda.gov/locator/app?agency=nrcs>) or your NRCS State Soil Scientist (http://www.nrcs.usda.gov/wps/portal/nrcs/detail/soils/contactus/?cid=nrcs142p2_053951).

Great differences in soil properties can occur within short distances. Some soils are seasonally wet or subject to flooding. Some are too unstable to be used as a foundation for buildings or roads. Clayey or wet soils are poorly suited to use as septic tank absorption fields. A high water table makes a soil poorly suited to basements or underground installations.

The National Cooperative Soil Survey is a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local agencies. The Natural Resources Conservation Service (NRCS) has leadership for the Federal part of the National Cooperative Soil Survey.

Information about soils is updated periodically. Updated information is available through the NRCS Web Soil Survey, the site for official soil survey information.

How Soil Surveys Are Made

Soil surveys are made to provide information about the soils and miscellaneous areas in a specific area. They include a description of the soils and miscellaneous areas and their location on the landscape and tables that show soil properties and limitations affecting various uses. Soil scientists observed the steepness, length, and shape of the slopes; the general pattern of drainage; the kinds of crops and native plants; and the kinds of bedrock. They observed and described many soil profiles. A soil profile is the sequence of natural layers, or horizons, in a soil. The profile extends from the surface down into the unconsolidated material in which the soil formed or from the surface down to bedrock. The unconsolidated material is devoid of roots and other living organisms and has not been changed by other biological activity.

Currently, soils are mapped according to the boundaries of major land resource areas (MLRAs). MLRAs are geographically associated land resource units that share common characteristics related to physiography, geology, climate, water resources, soils, biological resources, and land uses (USDA, 2006). Soil survey areas typically consist of parts of one or more MLRA.

The soils and miscellaneous areas in a survey area occur in an orderly pattern that is related to the geology, landforms, relief, climate, and natural vegetation of the area. Each kind of soil and miscellaneous area is associated with a particular kind of landform or with a segment of the landform. By observing the soils and miscellaneous areas in the survey area and relating their position to specific segments of the landform, a soil scientist develops a concept, or model, of how they were formed. Thus, during mapping, this model enables the soil scientist to predict with a considerable degree of accuracy the kind of soil or miscellaneous area at a specific location on the landscape.

Commonly, individual soils on the landscape merge into one another as their characteristics gradually change. To construct an accurate soil map, however, soil scientists must determine the boundaries between the soils. They can observe only a limited number of soil profiles. Nevertheless, these observations, supplemented by an understanding of the soil-vegetation-landscape relationship, are sufficient to verify predictions of the kinds of soil in an area and to determine the boundaries.

Soil scientists recorded the characteristics of the soil profiles that they studied. They noted soil color, texture, size and shape of soil aggregates, kind and amount of rock fragments, distribution of plant roots, reaction, and other features that enable them to identify soils. After describing the soils in the survey area and determining their properties, the soil scientists assigned the soils to taxonomic classes (units).

Taxonomic classes are concepts. Each taxonomic class has a set of soil characteristics with precisely defined limits. The classes are used as a basis for comparison to classify soils systematically. Soil taxonomy, the system of taxonomic classification used in the United States, is based mainly on the kind and character of soil properties and the arrangement of horizons within the profile. After the soil

Custom Soil Resource Report

scientists classified and named the soils in the survey area, they compared the individual soils with similar soils in the same taxonomic class in other areas so that they could confirm data and assemble additional data based on experience and research.

The objective of soil mapping is not to delineate pure map unit components; the objective is to separate the landscape into landforms or landform segments that have similar use and management requirements. Each map unit is defined by a unique combination of soil components and/or miscellaneous areas in predictable proportions. Some components may be highly contrasting to the other components of the map unit. The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The delineation of such landforms and landform segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, onsite investigation is needed to define and locate the soils and miscellaneous areas.

Soil scientists make many field observations in the process of producing a soil map. The frequency of observation is dependent upon several factors, including scale of mapping, intensity of mapping, design of map units, complexity of the landscape, and experience of the soil scientist. Observations are made to test and refine the soil-landscape model and predictions and to verify the classification of the soils at specific locations. Once the soil-landscape model is refined, a significantly smaller number of measurements of individual soil properties are made and recorded. These measurements may include field measurements, such as those for color, depth to bedrock, and texture, and laboratory measurements, such as those for content of sand, silt, clay, salt, and other components. Properties of each soil typically vary from one point to another across the landscape.

Observations for map unit components are aggregated to develop ranges of characteristics for the components. The aggregated values are presented. Direct measurements do not exist for every property presented for every map unit component. Values for some properties are estimated from combinations of other properties.

While a soil survey is in progress, samples of some of the soils in the area generally are collected for laboratory analyses and for engineering tests. Soil scientists interpret the data from these analyses and tests as well as the field-observed characteristics and the soil properties to determine the expected behavior of the soils under different uses. Interpretations for all of the soils are field tested through observation of the soils in different uses and under different levels of management. Some interpretations are modified to fit local conditions, and some new interpretations are developed to meet local needs. Data are assembled from other sources, such as research information, production records, and field experience of specialists. For example, data on crop yields under defined levels of management are assembled from farm records and from field or plot experiments on the same kinds of soil.

Predictions about soil behavior are based not only on soil properties but also on such variables as climate and biological activity. Soil conditions are predictable over long periods of time, but they are not predictable from year to year. For example, soil scientists can predict with a fairly high degree of accuracy that a given soil will have a high water table within certain depths in most years, but they cannot predict that a high water table will always be at a specific level in the soil on a specific date.

After soil scientists located and identified the significant natural bodies of soil in the survey area, they drew the boundaries of these bodies on aerial photographs and

Custom Soil Resource Report

identified each as a specific map unit. Aerial photographs show trees, buildings, fields, roads, and rivers, all of which help in locating boundaries accurately.

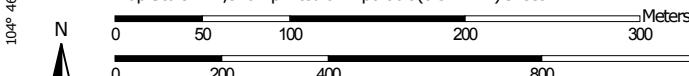

Soil Map

The soil map section includes the soil map for the defined area of interest, a list of soil map units on the map and extent of each map unit, and cartographic symbols displayed on the map. Also presented are various metadata about data used to produce the map, and a description of each soil map unit.

Map Unit Descriptions

The map units delineated on the detailed soil maps in a soil survey represent the soils or miscellaneous areas in the survey area. The map unit descriptions, along with the maps, can be used to determine the composition and properties of a unit.

A map unit delineation on a soil map represents an area dominated by one or more major kinds of soil or miscellaneous areas. A map unit is identified and named according to the taxonomic classification of the dominant soils. Within a taxonomic class there are precisely defined limits for the properties of the soils. On the landscape, however, the soils are natural phenomena, and they have the characteristic variability of all natural phenomena. Thus, the range of some observed properties may extend beyond the limits defined for a taxonomic class. Areas of soils of a single taxonomic class rarely, if ever, can be mapped without including areas of other taxonomic classes. Consequently, every map unit is made up of the soils or miscellaneous areas for which it is named and some minor components that belong to taxonomic classes other than those of the major soils.

Most minor soils have properties similar to those of the dominant soil or soils in the map unit, and thus they do not affect use and management. These are called noncontrasting, or similar, components. They may or may not be mentioned in a particular map unit description. Other minor components, however, have properties and behavioral characteristics divergent enough to affect use or to require different management. These are called contrasting, or dissimilar, components. They generally are in small areas and could not be mapped separately because of the scale used. Some small areas of strongly contrasting soils or miscellaneous areas are identified by a special symbol on the maps. If included in the database for a given area, the contrasting minor components are identified in the map unit descriptions along with some characteristics of each. A few areas of minor components may not have been observed, and consequently they are not mentioned in the descriptions, especially where the pattern was so complex that it was impractical to make enough observations to identify all the soils and miscellaneous areas on the landscape.

The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The objective of mapping is not to delineate pure taxonomic classes but rather to separate the landscape into landforms or

landform segments that have similar use and management requirements. The delineation of such segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, however, onsite investigation is needed to define and locate the soils and miscellaneous areas.

An identifying symbol precedes the map unit name in the map unit descriptions. Each description includes general facts about the unit and gives important soil properties and qualities.

Soils that have profiles that are almost alike make up a *soil series*. Except for differences in texture of the surface layer, all the soils of a series have major horizons that are similar in composition, thickness, and arrangement.

Soils of one series can differ in texture of the surface layer, slope, stoniness, salinity, degree of erosion, and other characteristics that affect their use. On the basis of such differences, a soil series is divided into *soil phases*. Most of the areas shown on the detailed soil maps are phases of soil series. The name of a soil phase commonly indicates a feature that affects use or management. For example, Alpha silt loam, 0 to 2 percent slopes, is a phase of the Alpha series.

Some map units are made up of two or more major soils or miscellaneous areas. These map units are complexes, associations, or undifferentiated groups.

A *complex* consists of two or more soils or miscellaneous areas in such an intricate pattern or in such small areas that they cannot be shown separately on the maps. The pattern and proportion of the soils or miscellaneous areas are somewhat similar in all areas. Alpha-Beta complex, 0 to 6 percent slopes, is an example.

An *association* is made up of two or more geographically associated soils or miscellaneous areas that are shown as one unit on the maps. Because of present or anticipated uses of the map units in the survey area, it was not considered practical or necessary to map the soils or miscellaneous areas separately. The pattern and relative proportion of the soils or miscellaneous areas are somewhat similar. Alpha-Beta association, 0 to 2 percent slopes, is an example.

An *undifferentiated group* is made up of two or more soils or miscellaneous areas that could be mapped individually but are mapped as one unit because similar interpretations can be made for use and management. The pattern and proportion of the soils or miscellaneous areas in a mapped area are not uniform. An area can be made up of only one of the major soils or miscellaneous areas, or it can be made up of all of them. Alpha and Beta soils, 0 to 2 percent slopes, is an example.

Some surveys include *miscellaneous areas*. Such areas have little or no soil material and support little or no vegetation. Rock outcrop is an example.

El Paso County Area, Colorado

26—Elbeth sandy loam, 8 to 15 percent slopes

Map Unit Setting

National map unit symbol: 367y

Elevation: 7,300 to 7,600 feet

Farmland classification: Not prime farmland

Map Unit Composition

Elbeth and similar soils: 85 percent

3.2 Time of Concentration

One of the basic assumptions underlying the Rational Method is that runoff is a function of the average rainfall rate during the time required for water to flow from the hydraulically most remote part of the drainage area under consideration to the design point. However, in practice, the time of concentration can be an empirical value that results in reasonable and acceptable peak flow calculations.

For urban areas, the time of concentration (t_c) consists of an initial time or overland flow time (t_i) plus the travel time (t_t) in the storm sewer, paved gutter, roadside drainage ditch, or drainage channel. For non-urban areas, the time of concentration consists of an overland flow time (t_i) plus the time of travel in a concentrated form, such as a swale or drainageway. The travel portion (t_t) of the time of concentration can be estimated from the hydraulic properties of the storm sewer, gutter, swale, ditch, or drainageway. Initial time, on the other hand, will vary with surface slope, depression storage, surface cover, antecedent rainfall, and infiltration capacity of the soil, as well as distance of surface flow. The time of concentration is represented by Equation 6-7 for both urban and non-urban areas.

$$t_c = t_i + t_t \quad (\text{Eq. 6-7})$$

Where:

t_c = time of concentration (min)

t_i = overland (initial) flow time (min)

t_t = travel time in the ditch, channel, gutter, storm sewer, etc. (min)

3.2.1 Overland (Initial) Flow Time

The overland flow time, t_i , may be calculated using Equation 6-8.

$$t_i = \frac{0.395(1.1 - C_5)\sqrt{L}}{S^{0.33}} \quad (\text{Eq. 6-8})$$

Where:

t_i = overland (initial) flow time (min)

C_5 = runoff coefficient for 5-year frequency (see Table 6-6)

L = length of overland flow (300 ft maximum for non-urban land uses, 100 ft maximum for urban land uses)

S = average basin slope (ft/ft)

Note that in some urban watersheds, the overland flow time may be very small because flows quickly concentrate and channelize.

3.2.2 Travel Time

For catchments with overland and channelized flow, the time of concentration needs to be considered in combination with the travel time, t_t , which is calculated using the hydraulic properties of the swale, ditch, or channel. For preliminary work, the overland travel time, t_t , can be estimated with the help of Figure 6-25 or Equation 6-9 (Guo 1999).

$$V = C_v S_w^{0.5} \quad (\text{Eq. 6-9})$$

Where:

V = velocity (ft/s)

C_v = conveyance coefficient (from Table 6-7)

S_w = watercourse slope (ft/ft)

Table 6-7. Conveyance Coefficient, C_v

| Type of Land Surface | C_v |
|--------------------------------------|-------|
| Heavy meadow | 2.5 |
| Tillage/field | 5 |
| Riprap (not buried)* | 6.5 |
| Short pasture and lawns | 7 |
| Nearly bare ground | 10 |
| Grassed waterway | 15 |
| Paved areas and shallow paved swales | 20 |

* For buried riprap, select C_v value based on type of vegetative cover.

The travel time is calculated by dividing the flow distance (in feet) by the velocity calculated using Equation 6-9 and converting units to minutes.

The time of concentration (t_c) is then the sum of the overland flow time (t_i) and the travel time (t_t) per Equation 6-7.

3.2.3 First Design Point Time of Concentration in Urban Catchments

Using this procedure, the time of concentration at the first design point (typically the first inlet in the system) in an urbanized catchment should not exceed the time of concentration calculated using Equation 6-10. The first design point is defined as the point where runoff first enters the storm sewer system.

$$t_c = \frac{L}{180} + 10 \quad (\text{Eq. 6-10})$$

Where:

t_c = maximum time of concentration at the first design point in an urban watershed (min)

L = waterway length (ft)

Equation 6-10 was developed using the rainfall-runoff data collected in the Denver region and, in essence, represents regional “calibration” of the Rational Method. Normally, Equation 6-10 will result in a lesser time of concentration at the first design point and will govern in an urbanized watershed. For subsequent design points, the time of concentration is calculated by accumulating the travel times in downstream drainageway reaches.

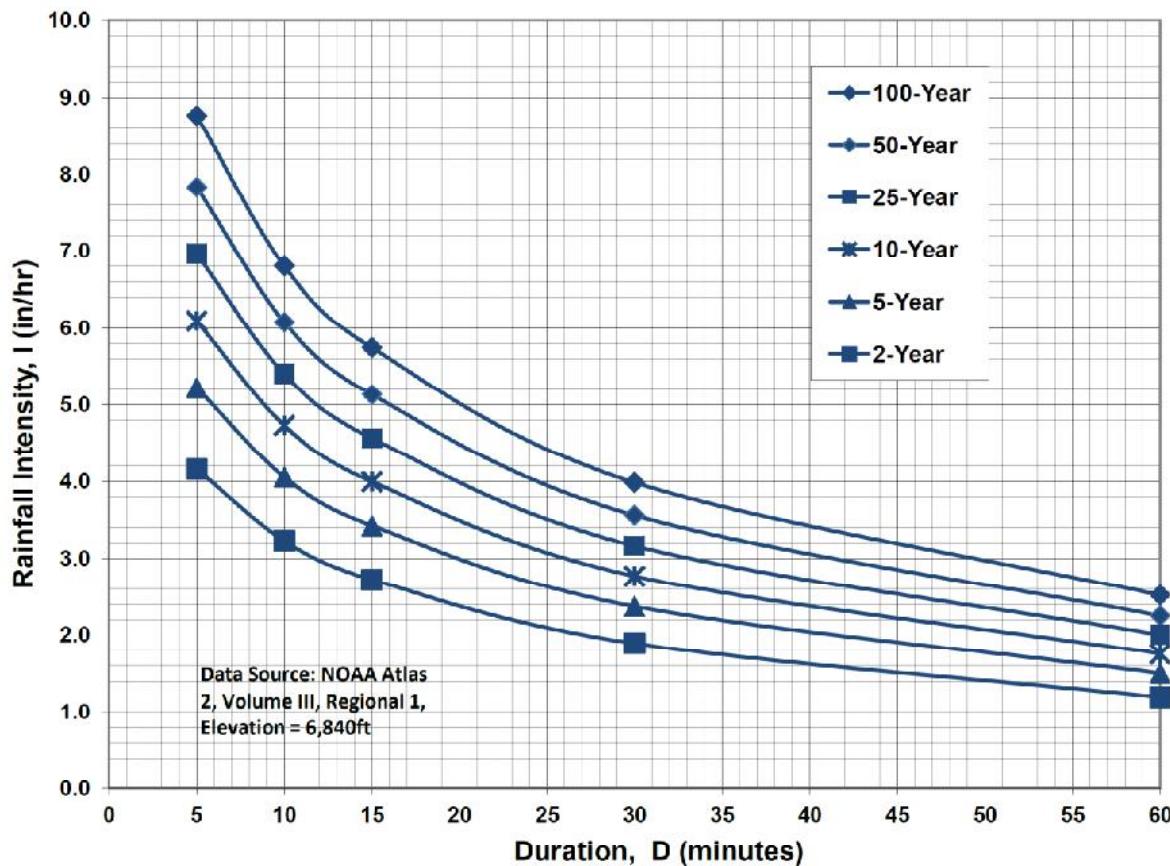

3.2.4 Minimum Time of Concentration

If the calculations result in a t_c of less than 10 minutes for undeveloped conditions, it is recommended that a minimum value of 10 minutes be used. The minimum t_c for urbanized areas is 5 minutes.

3.2.5 Post-Development Time of Concentration

As Equation 6-8 indicates, the time of concentration is a function of the 5-year runoff coefficient for a drainage basin. Typically, higher levels of imperviousness (higher 5-year runoff coefficients) correspond to shorter times of concentration, and lower levels of imperviousness correspond to longer times of

Figure 6-5. Colorado Springs Rainfall Intensity Duration Frequency

IDF Equations

$$I_{100} = -2.52 \ln(D) + 12.735$$

$$I_{50} = -2.25 \ln(D) + 11.375$$

$$I_{25} = -2.00 \ln(D) + 10.111$$

$$I_{10} = -1.75 \ln(D) + 8.847$$

$$I_5 = -1.50 \ln(D) + 7.583$$

$$I_2 = -1.19 \ln(D) + 6.035$$

Note: Values calculated by equations may not precisely duplicate values read from figure.

1) Channel flow calculations based on Manning's Equation

2) n = 0.03 for grass-lined non-irrigated channels

3) Vmax = 4.0 fps for 100-year flows w/ native grass-lined channels (per ECM Table 10-4 & NRCS Companion Document 580-10)

4) Vmax = 8.0 fps for 100-year flows w/ Erosion Control Blankets (Tensar Eronet SC150 or equal)

Hydraulic Analysis Report

Project Data

Project Title: Project-MA-Ditches
Designer: JPS
Project Date: Tuesday, February 5, 2019
Project Units: U.S. Customary Units
Notes:

Channel Analysis: Pinehurst-1096-1639-N

Notes:

Input Parameters

Channel Type: Triangular
Side Slope 1 (Z1): 4.0000 ft/ft
Side Slope 2 (Z2): 3.0000 ft/ft
Longitudinal Slope: 0.0800 ft/ft
Manning's n: 0.0300
Flow: 8.3000 cfs

Result Parameters

Depth: 0.6170 ft
Area of Flow: 1.3326 ft²
Wetted Perimeter: 4.4953 ft
Hydraulic Radius: 0.2964 ft
Average Velocity: 6.2286 ft/s
Top Width: 4.3192 ft
Froude Number: 1.9762
Critical Depth: 0.8136 ft
Critical Velocity: 3.5822 ft/s
Critical Slope: 0.0183 ft/ft
Critical Top Width: 5.81 ft
Calculated Max Shear Stress: 3.0802 lb/ft²
Calculated Avg Shear Stress: 1.4798 lb/ft²

Channel Analysis: Pinehurst-1096-1639-S

Notes:

Input Parameters

Channel Type: Triangular
Side Slope 1 (Z1): 4.0000 ft/ft
Side Slope 2 (Z2): 3.0000 ft/ft
Longitudinal Slope: 0.0800 ft/ft
Manning's n: 0.0300
Flow: 2.5000 cfs

Result Parameters

Depth: 0.3934 ft
Area of Flow: 0.5418 ft²
Wetted Perimeter: 2.8664 ft
Hydraulic Radius: 0.1890 ft
Average Velocity: 4.6143 ft/s
Top Width: 2.7541 ft
Froude Number: 1.8334
Critical Depth: 0.5035 ft
Critical Velocity: 2.8179 ft/s
Critical Slope: 0.0215 ft/ft
Critical Top Width: 3.60 ft
Calculated Max Shear Stress: 1.9641 lb/ft²
Calculated Avg Shear Stress: 0.9436 lb/ft²

Channel Analysis: Pinehurst-1639-1797-N

Notes:

Input Parameters

Channel Type: Triangular
Side Slope 1 (Z1): 4.0000 ft/ft
Side Slope 2 (Z2): 3.0000 ft/ft
Longitudinal Slope: 0.0400 ft/ft
Manning's n: 0.0300
Flow: 4.0000 cfs

Result Parameters

Depth: 0.5344 ft
Area of Flow: 0.9996 ft²
Wetted Perimeter: 3.8933 ft
Hydraulic Radius: 0.2567 ft
Average Velocity: 4.0018 ft/s
Top Width: 3.7408 ft
Froude Number: 1.3643
Critical Depth: 0.6076 ft
Critical Velocity: 3.0956 ft/s
Critical Slope: 0.0202 ft/ft
Critical Top Width: 4.34 ft
Calculated Max Shear Stress: 1.3339 lb/ft²
Calculated Avg Shear Stress: 0.6408 lb/ft²

Channel Analysis: Pinehurst-1639-1797-S

Notes:

Input Parameters

Channel Type: Triangular
Side Slope 1 (Z1): 4.0000 ft/ft
Side Slope 2 (Z2): 3.0000 ft/ft
Longitudinal Slope: 0.0400 ft/ft
Manning's n: 0.0300
Flow: 2.5000 cfs

Result Parameters

Depth: 0.4480 ft
Area of Flow: 0.7026 ft²
Wetted Perimeter: 3.2642 ft
Hydraulic Radius: 0.2152 ft
Average Velocity: 3.5581 ft/s
Top Width: 3.1363 ft
Froude Number: 1.3248
Critical Depth: 0.5035 ft
Critical Velocity: 2.8179 ft/s
Critical Slope: 0.0215 ft/ft
Critical Top Width: 3.60 ft
Calculated Max Shear Stress: 1.1183 lb/ft²
Calculated Avg Shear Stress: 0.5373 lb/ft²

Channel Analysis: Pinehurst-1797-2197-N

Notes:

Input Parameters

Channel Type: Triangular
Side Slope 1 (Z1): 4.0000 ft/ft
Side Slope 2 (Z2): 3.0000 ft/ft
Longitudinal Slope: 0.0800 ft/ft
Manning's n: 0.0300
Flow: 2.0000 cfs

Result Parameters

Depth: 0.3619 ft
Area of Flow: 0.4583 ft²
Wetted Perimeter: 2.6363 ft
Hydraulic Radius: 0.1738 ft
Average Velocity: 4.3640 ft/s
Top Width: 2.5330 ft
Froude Number: 1.8080
Critical Depth: 0.4605 ft
Critical Velocity: 2.6949 ft/s
Critical Slope: 0.0221 ft/ft
Critical Top Width: 3.29 ft
Calculated Max Shear Stress: 1.8064 lb/ft²
Calculated Avg Shear Stress: 0.8678 lb/ft²

Channel Analysis: Pinehurst-1797-2197-S

Notes:

Input Parameters

Channel Type: Triangular
Side Slope 1 (Z1): 4.0000 ft/ft
Side Slope 2 (Z2): 3.0000 ft/ft
Longitudinal Slope: 0.0800 ft/ft
Manning's n: 0.0300
Flow: 2.5000 cfs

Result Parameters

Depth: 0.3934 ft
Area of Flow: 0.5418 ft²
Wetted Perimeter: 2.8664 ft
Hydraulic Radius: 0.1890 ft
Average Velocity: 4.6143 ft/s
Top Width: 2.7541 ft
Froude Number: 1.8334
Critical Depth: 0.5035 ft
Critical Velocity: 2.8179 ft/s
Critical Slope: 0.0215 ft/ft
Critical Top Width: 3.60 ft
Calculated Max Shear Stress: 1.9641 lb/ft²
Calculated Avg Shear Stress: 0.9436 lb/ft²

Channel Analysis: Pinehurst-2197-2441-N

Notes:

Input Parameters

Channel Type: Triangular
Side Slope 1 (Z1): 4.0000 ft/ft
Side Slope 2 (Z2): 3.0000 ft/ft
Longitudinal Slope: 0.0400 ft/ft
Manning's n: 0.0300
Flow: 2.2000 cfs

Result Parameters

Depth: 0.4271 ft
Area of Flow: 0.6384 ft²
Wetted Perimeter: 3.1114 ft
Hydraulic Radius: 0.2052 ft
Average Velocity: 3.4462 ft/s
Top Width: 2.9895 ft
Froude Number: 1.3142
Critical Depth: 0.4784 ft
Critical Velocity: 2.7468 ft/s
Critical Slope: 0.0218 ft/ft
Critical Top Width: 3.42 ft
Calculated Max Shear Stress: 1.0660 lb/ft²
Calculated Avg Shear Stress: 0.5121 lb/ft²

Channel Analysis: Pinehurst-2197-2441-S

Notes:

Input Parameters

Channel Type: Triangular
Side Slope 1 (Z1): 4.0000 ft/ft

- 2) Channel depth includes 1' minimum freeboard
- 3) n = 0.03 for grass-lined non-irrigated channels (minimum)
- 4) n = 0.04 for riprap-lined channels
- 5) Vmax = 4.0 fps for 100-year flows w/ native grass-lined channels
- 6) Vmax = 8.0 fps for 100-year flows w/ Erosion Control Blankets (Tensar Eronet SC125 or equal)

Hydraulic Analysis Report

Project Data

Project Title: Monument Academy – Drainage Channels

Designer: JPS

Project Date: Thursday, February 7, 2019

Project Units: U.S. Customary Units

Notes:

Channel Analysis: Channel Analysis - Channel M2.3A

Notes:

Input Parameters

Channel Type: Trapezoidal

Side Slope 1 (Z1): 4.0000 ft/ft

Side Slope 2 (Z2): 4.0000 ft/ft

Channel Width: 12.0000 ft

Longitudinal Slope: 0.0710 ft/ft

Manning's n: 0.0300

Flow: 40.0000 cfs

Result Parameters

Depth: 0.4251 ft

Area of Flow: 5.8239 ft²

Wetted Perimeter: 15.5054 ft

Hydraulic Radius: 0.3756 ft

Average Velocity: 6.8682 ft/s

Top Width: 15.4007 ft

Froude Number: 1.9683

Critical Depth: 0.6499 ft

Critical Velocity: 4.2160 ft/s

Critical Slope: 0.0162 ft/ft

Critical Top Width: 17.20 ft

Calculated Max Shear Stress: 1.8833 lb/ft²

Calculated Avg Shear Stress: 1.6641 lb/ft²

Channel Analysis: Channel Analysis - Channel M2.3B (Rundown)

Notes:

Input Parameters

Channel Type: Trapezoidal
Side Slope 1 (Z1): 3.0000 ft/ft
Side Slope 2 (Z2): 3.0000 ft/ft
Channel Width: 8.0000 ft
Longitudinal Slope: 0.2000 ft/ft
Manning's n: 0.0400
Lining Type: Rock Riprap - 300 mm (12-inch)
Flow: 40.0000 cfs

Result Parameters

Depth: 0.4695 ft
Area of Flow: 4.4168 ft²
Wetted Perimeter: 10.9691 ft
Hydraulic Radius: 0.4027 ft
Average Velocity: 9.0564 ft/s
Top Width: 10.8167 ft
Froude Number: 2.4976
Critical Depth: 0.8242 ft
Critical Velocity: 4.6343 ft/s
Critical Slope: 0.0275 ft/ft
Critical Top Width: 12.95 ft
Calculated Max Shear Stress: 5.8587 lb/ft²
Calculated Avg Shear Stress: 5.0251 lb/ft²

PROJECT: MONUMENT ACADEMY
CHANNEL: M2.3B (RIPRAP RUNDOWN INTO POND M3)

RIPRAP SIZING:

$$d_{50} > [(VS^{0.17}) / (4.5(Gs - 1)^{0.66})]^2 \quad (\text{USDCM EQUATION 8-11})$$

ASSUMPTIONS:

| | | |
|-------------------|-----------|--|
| V = | 9.06 FPS | MEAN CHANNEL VELOCITY |
| S = | 0.2 FT/FT | LONGITUDINAL SLOPE PER CHANNEL PROFILE |
| Gs = | 2.5 | SPECIFIC GRAVITY OF STONE |
| d ₅₀ = | | CALCULATED MEAN ROCK SIZE |

CALCULATED RIPRAP SIZE:

$$\begin{aligned} d_{50} &= 1.37 \text{ FT} \\ d_{50} &= 16.48 \text{ INCHES} \end{aligned}$$

SELECTED MEAN RIPRAP SIZE = 18 INCHES (TYPE H RIPRAP)

8.1 Riprap Sizing

Procedures for sizing rock to be used in soil riprap, void-filled riprap, and riprap over bedding are the same.

8.1.1 Mild Slope Conditions

When subcritical flow conditions occur and/or slopes are mild (less than 2 percent), UDFCD recommends the following equation (Hughes, et al, 1983):

$$d_{50} \geq \left[\frac{VS^{0.17}}{4.5(G_s - 1)^{0.66}} \right]^2 \quad \text{Equation 8-11}$$

Where:

V = mean channel velocity (ft/sec)

S = longitudinal channel slope (ft/ft)

d_{50} = mean rock size (ft)

G_s = specific gravity of stone (minimum = 2.50, typically 2.5 to 2.7), Note: In this equation ($G_s - 1$) considers the buoyancy of the water, in that the specific gravity of water is subtracted from the specific gravity of the rock.

Note that Equation 8-11 is applicable for sizing riprap for channel lining with a longitudinal slope of no more than 2%. This equation is not intended for use in sizing riprap for steep slopes (typically in excess of 2 percent), rundowns, or protection downstream of culverts. Information on rundowns is provided in Section 7.0 of the *Hydraulic Structures* chapter of the USDCM, and protection downstream of culverts is discussed in the *Culverts and Bridges* chapter. For channel slopes greater than 2% use one of the methods presented in 8.1.2.

Rock size does not need to be increased for steeper channel side slopes, provided the side slopes are no steeper than 2.5H:1V (UDFCD 1982). Channel side slopes steeper than 2.5H:1V are not recommended because of stability, safety, and maintenance considerations. See Figure 8-34 for riprap placement specifications. At the upstream and downstream termination of a riprap lining, the thickness should be increased 50% for at least 3 feet to prevent undercutting.

8.1.2 Steep Slope Conditions

Steep slope rock sizing equations are used for applications where the slope is greater than 2 percent and/or flows are in the supercritical flow regime. The following rock sizing equations may be referred to for riprap design analysis on steep slopes:

- CSU Equation, *Development of Riprap Design Criteria by Riprap Testing in Flumes: Phase II* (prepared by S.R. Abt, et al, Colorado State University, 1988). This method was developed for steep slopes from 2 to 20 percent.
- USDA- Agricultural Research Service Equations, *Design of Rock Chutes* (by K.M. Robinson, et al, USDA- ARS, 1998 Transactions of ASAE) and *An Excel Program to Design Rock Chutes for Grade*

ALLOWABLE CAPACITY FOR ONE-HALF OF STREET (Minor & Major Storm)

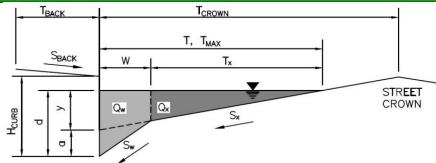

(Based on Regulated Criteria for Maximum Allowable Flow Depth and Spread)

Project:

Monument Academy - Inlet M2.1 (Sump Condition)

Inlet ID:

Inlet M2.1

**Gutter Geometry (Enter data in the blue cells)**

Maximum Allowable Width for Spread Behind Curb

 $T_{BACK} =$ ft

Side Slope Behind Curb (leave blank for no conveyance credit behind curb)

 $S_{BACK} =$ ft/ft

Manning's Roughness Behind Curb (typically between 0.012 and 0.020)

 $n_{BACK} =$

Height of Curb at Gutter Flow Line

 $H_{CURB} =$ inches

Distance from Curb Face to Street Crown

 $T_{CROWN} =$ ft

Gutter Width

 $W =$ ft

Street Transverse Slope

 $S_x =$ ft/ft

Gutter Cross Slope (typically 2 inches over 24 inches or 0.083 ft/ft)

 $S_w =$ ft/ft

Street Longitudinal Slope - Enter 0 for sump condition

 $S_o =$ ft/ft

Manning's Roughness for Street Section (typically between 0.012 and 0.020)

 $n_{STREET} =$

Max. Allowable Spread for Minor & Major Storm

Minor Storm Major Storm

Max. Allowable Depth at Gutter Flowline for Minor & Major Storm

 $T_{MAX} =$ ft

Check boxes are not applicable in SUMP conditions

 $d_{MAX} =$ inches

MINOR STORM Allowable Capacity is based on Depth Criterion

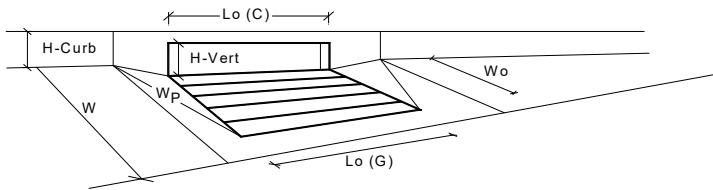

Minor Storm Major Storm

MAJOR STORM Allowable Capacity is based on Depth Criterion

 $Q_{allow} =$ cfs

Warning 5: The width of unit is greater than the gutter width.

ALLOWABLE CAPACITY FOR ONE-HALF OF STREET (Minor & Major Storm)

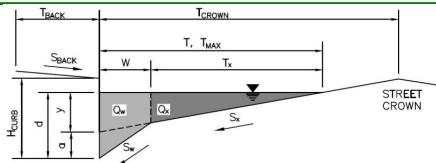

(Based on Regulated Criteria for Maximum Allowable Flow Depth and Spread)

Project:

Monument Academy - Inlet M2.3 (Sump Condition)

Inlet ID:

Inlet M2.3

**Gutter Geometry (Enter data in the blue cells)**

Maximum Allowable Width for Spread Behind Curb

T_BACK = ft

Side Slope Behind Curb (leave blank for no conveyance credit behind curb)

S_BACK = ft/ft

Manning's Roughness Behind Curb (typically between 0.012 and 0.020)

n_BACK =

Height of Curb at Gutter Flow Line

H_CURB = inches

Distance from Curb Face to Street Crown

T_CROWN = ft

Gutter Width

W = ft

Street Transverse Slope

S_x = ft/ft

Gutter Cross Slope (typically 2 inches over 24 inches or 0.083 ft/ft)

S_w = ft/ft

Street Longitudinal Slope - Enter 0 for sump condition

S_o = ft/ft

Manning's Roughness for Street Section (typically between 0.012 and 0.020)

n_STREET =

Max. Allowable Spread for Minor & Major Storm

Minor Storm ft**Warning 02**

Max. Allowable Depth at Gutter Flowline for Minor & Major Storm

Major Storm ft

Check boxes are not applicable in SUMP conditions

MINOR STORM Allowable Capacity is based on Depth Criterion

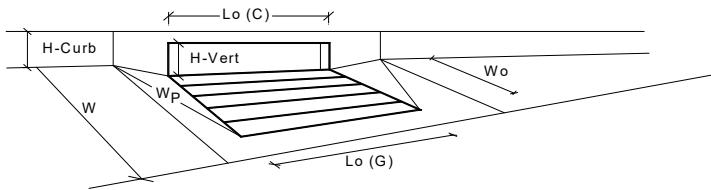

Minor Storm cfs

MAJOR STORM Allowable Capacity is based on Depth Criterion

Major Storm cfs

INLET IN A SUMP OR SAG LOCATION

Version 4.05 Released March 2017

Detention Basin Outlet Structure Design

UD-Detention, Version 3.07 (February 2017)

Project: Walden NW / Monument Academy

Basin ID: C14

| | Stage (ft) | Zone Volume (ac-ft) | Outlet Type |
|-------------------|------------|---------------------|----------------------|
| Zone 1 (WQCV) | 1.90 | 0.187 | Orifice Plate |
| Zone 2 (EURV) | 3.60 | 0.248 | Orifice Plate |
| Zone 3 (100-year) | 5.93 | 0.552 | Weir&Pipe (Restrict) |
| | | 0.988 | Total |

User Input: Orifice at Underdrain Outlet (typically used to drain WQCV in a filtration BMP)

Underdrain Orifice Invert Depth = ft (distance below the filtration media surface)
Underdrain Orifice Diameter = inches

Calculated Parameters for Underdrain

Underdrain Orifice Area = ft²
Underdrain Orifice Centroid = feet

User Input: Orifice Plate with one or more orifices or Elliptical Slot Weir (typically used to drain WQCV and/or EURV in a sedimentation BMP)

Invert of Lowest Orifice = ft (relative to basin bottom at Stage = 0 ft)
Depth at top of Zone using Orifice Plate = ft (relative to basin bottom at Stage = 0 ft)
Orifice Plate: Orifice Vertical Spacing = inches
Orifice Plate: Orifice Area per Row = sq. inches (diameter = 1-3/8 inches)

Calculated Parameters for Plate

WQ Orifice Area per Row = ft²
Elliptical Half-Width = feet
Elliptical Slot Centroid = feet
Elliptical Slot Area = ft²

User Input: Stage and Total Area of Each Orifice Row (numbered from lowest to highest)

| Row 1 (required) | Row 2 (optional) | Row 3 (optional) | Row 4 (optional) | Row 5 (optional) | Row 6 (optional) | Row 7 (optional) | Row 8 (optional) |
|--------------------------------|-------------------|-------------------|-------------------|-------------------|-------------------|-------------------|-------------------|
| Stage of Orifice Centroid (ft) | 0.00 | 1.20 | 2.40 | | | | |
| Orifice Area (sq. inches) | 1.49 | 1.49 | 1.49 | | | | |
| | | | | | | | |
| Row 9 (optional) | Row 10 (optional) | Row 11 (optional) | Row 12 (optional) | Row 13 (optional) | Row 14 (optional) | Row 15 (optional) | Row 16 (optional) |
| Stage of Orifice Centroid (ft) | | | | | | | |
| Orifice Area (sq. inches) | | | | | | | |

User Input: Vertical Orifice (Circular or Rectangular)

Invert of Vertical Orifice = ft (relative to basin bottom at Stage = 0 ft)
Depth at top of Zone using Vertical Orifice = ft (relative to basin bottom at Stage = 0 ft)
Vertical Orifice Diameter = inches

Calculated Parameters for Vertical Orifice

Vertical Orifice Area = ft²
Vertical Orifice Centroid = feet

User Input: Overflow Weir (Dropbox) and Grate (Flat or Sloped)

Overflow Weir Front Edge Height, Ho = ft (relative to basin bottom at Stage = 0 ft)
Overflow Weir Front Edge Length = feet
Overflow Weir Slope = H:V (enter zero for flat grate)
Horiz. Length of Weir Sides = feet
Overflow Grate Open Area % = %, grate open area/total area
Debris Clogging % = %

Calculated Parameters for Overflow Weir

Zone 3 Weir = feet
Height of Grate Upper Edge, H_t = N/A feet
Over Flow Weir Slope Length = N/A feet
Grate Open Area / 100-yr Orifice Area = should be ≥ 4
Overflow Grate Open Area w/o Debris = ft²
Overflow Grate Open Area w/ Debris = ft²

User Input: Outlet Pipe w/ Flow Restriction Plate (Circular Orifice, Restrictor Plate, or Rectangular Orifice)

Depth to Invert of Outlet Pipe = ft (distance below basin bottom at Stage = 0 ft)
Outlet Pipe Diameter = inches
Restrictor Plate Height Above Pipe Invert = inches

Calculated Parameters for Outlet Pipe w/ Flow Restriction Plate

Zone 3 Restrictor = ft²
Outlet Orifice Area = feet
Outlet Orifice Centroid = radians
Half-Central Angle of Restrictor Plate on Pipe = radians

User Input: Emergency Spillway (Rectangular or Trapezoidal)

Spillway Invert Stage = ft (relative to basin bottom at Stage = 0 ft)
Spillway Crest Length = feet
Spillway End Slopes = H:V
Freeboard above Max Water Surface = feet

Calculated Parameters for Spillway

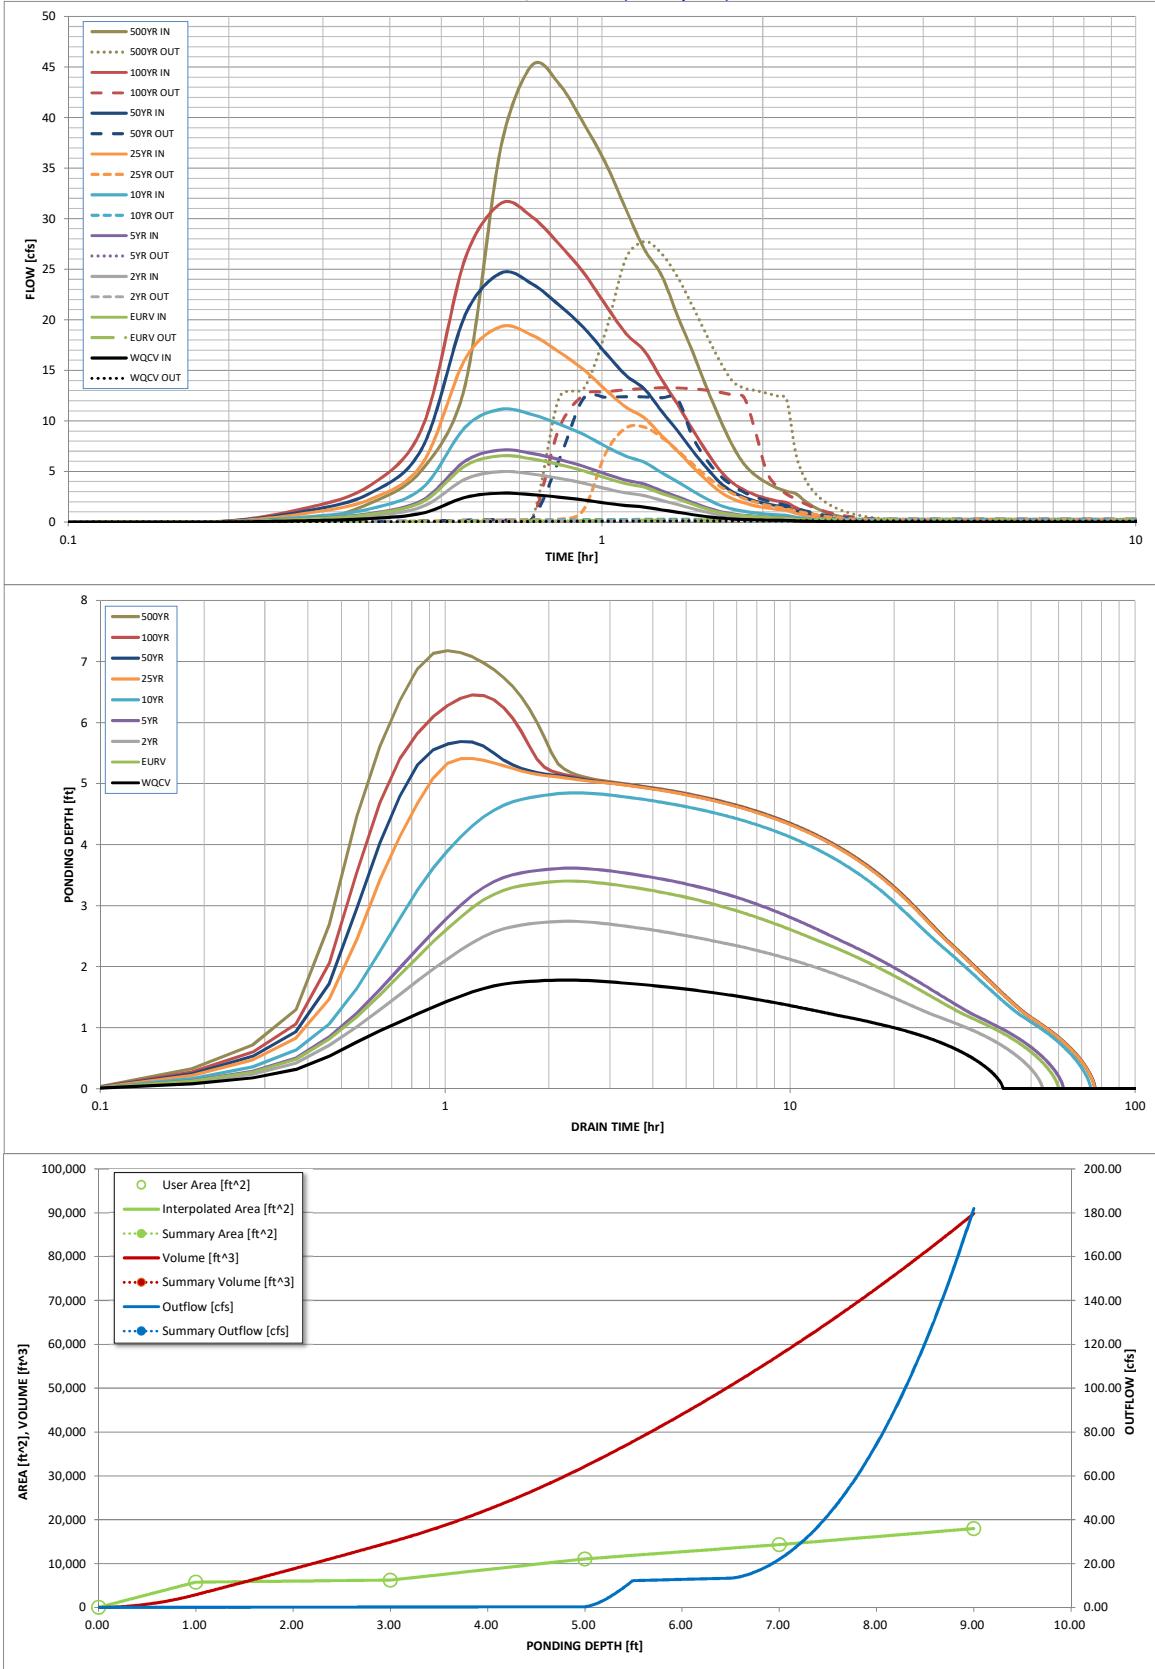

Spillway Design Flow Depth = feet
Stage at Top of Freeboard = feet
Basin Area at Top of Freeboard = acres

Location: DETENTION POND C14

5. Forebay

A) Minimum Forebay Volume
($V_{FMIN} = \underline{\hspace{2cm}} 2\% \text{ of the WQCV}$)

$$V_{FMIN} = \underline{\hspace{2cm}} 0.004 \text{ ac-ft}$$

B) Actual Forebay Volume

$$V_F = \underline{\hspace{2cm}} 0.005 \text{ ac-ft}$$

C) Forebay Depth
($D_F = \underline{\hspace{2cm}} 18 \text{ inch maximum}$)

$$D_F = \underline{\hspace{2cm}} 18.0 \text{ in}$$

D) Forebay Discharge

i) Undetained 100-year Peak Discharge

$$Q_{100} = \underline{\hspace{2cm}} 44.80 \text{ cfs}$$

ii) Forebay Discharge Design Flow
($Q_F = 0.02 * Q_{100}$)

$$Q_F = \underline{\hspace{2cm}} 0.90 \text{ cfs}$$

E) Forebay Discharge Design

Choose One
 Berm With Pipe
 Wall with Rect. Notch
 Wall with V-Notch Weir

(flow too small for berm w/ pipe)

F) Discharge Pipe Size (minimum 8-inches)

$$\text{Calculated } D_P = \underline{\hspace{2cm}} \text{ in}$$

G) Rectangular Notch Width

$$\text{Calculated } W_N = \underline{\hspace{2cm}} 5.4 \text{ in}$$

6. Trickle Channel

A) Type of Trickle Channel

Choose One
 Concrete
 Soft Bottom

F) Slope of Trickle Channel

$$S = \underline{\hspace{2cm}} 0.0050 \text{ ft / ft}$$

7. Micropool and Outlet Structure

A) Depth of Micropool (2.5-feet minimum)

$$D_M = \underline{\hspace{2cm}} 2.5 \text{ ft}$$

B) Surface Area of Micropool (10 ft² minimum)

$$A_M = \underline{\hspace{2cm}} 10 \text{ sq ft}$$

C) Outlet Type

Choose One
 Orifice Plate
 Other (Describe):

D) Smallest Dimension of Orifice Opening Based on Hydrograph Routing
(Use UD-Detention)

$$D_{orifice} = \underline{\hspace{2cm}} 1.38 \text{ inches}$$

E) Total Outlet Area

$$A_{ot} = \underline{\hspace{2cm}} 4.47 \text{ square inches}$$

Detention Basin Outlet Structure Design

UD-Detention, Version 3.07 (February 2017)

Detention Basin Outlet Structure Design

Outflow Hydrograph Workbook Filename:

Storm Inflow Hydrographs

UD-Detention, Version 3.07 (February 2017)

The user can override the calculated inflow hydrographs from this workbook with inflow hydrographs developed in a separate program.

Design Procedure Form: Extended Detention Basin (EDB)

UD-BMP (Version 3.06, November 2016)

Location: DETENTION POND M3

5. Forebay

A) Minimum Forebay Volume
($V_{FMIN} = \underline{\hspace{2cm}}\% \text{ of the WQCV}$)

$$V_{FMIN} = \underline{\hspace{2cm}} \text{ ac-ft}$$

B) Actual Forebay Volume

$$V_F = \underline{\hspace{2cm}} \text{ ac-ft} \quad \text{VF < MINIMUM VF}$$

C) Forebay Depth
($D_F = \underline{\hspace{2cm}} \text{ inch maximum}$)

$$D_F = \underline{\hspace{2cm}} \text{ in}$$

D) Forebay Discharge

i) Undetained 100-year Peak Discharge

$$Q_{100} = \underline{\hspace{2cm}} \text{ cfs}$$

ii) Forebay Discharge Design Flow
($Q_F = 0.02 * Q_{100}$)

$$Q_F = \underline{\hspace{2cm}} \text{ cfs}$$

E) Forebay Discharge Design

- Choose One
- Berm With Pipe
 - Wall with Rect. Notch
 - Wall with V-Notch Weir
- (flow too small for berm w/ pipe)

F) Discharge Pipe Size (minimum 8-inches)

$$\text{Calculated } D_P = \underline{\hspace{2cm}} \text{ in}$$

G) Rectangular Notch Width

$$\text{Calculated } W_N = \underline{\hspace{2cm}} \text{ in}$$

6. Trickle Channel

A) Type of Trickle Channel

- Choose One
- Concrete
 - Soft Bottom

F) Slope of Trickle Channel

$$S = \underline{\hspace{2cm}} \text{ ft / ft}$$

7. Micropool and Outlet Structure

A) Depth of Micropool (2.5-feet minimum)

$$D_M = \underline{\hspace{2cm}} \text{ ft}$$

B) Surface Area of Micropool (10 ft² minimum)

$$A_M = \underline{\hspace{2cm}} \text{ sq ft}$$

C) Outlet Type

- Choose One
- Orifice Plate
 - Other (Describe):
-
-

D) Smallest Dimension of Orifice Opening Based on Hydrograph Routing
(Use UD-Detention)

$$D_{orifice} = \underline{\hspace{2cm}} \text{ inches}$$

| | | | | | |
| | | | | | |
| TOTAL DRAINAGE IMPROVEMENTS | | | | | |
| | | | | | \$279,620 |
| | | | | | |
| | | | | | |
| | Note: This estimate does not include costs for street improvements (curb & gutter, crosspans, etc.) | | | | |
| | | | | | |

The cost estimate submitted herein is based on time-honored practices within the construction industry. As such the engineer does not control the cost of labor, materials, equipment or a contractor's method of determining prices and competitive bidding practices or market conditions. The estimate represents our best judgement as design professionals using current information available at the time of the preparation. The engineer cannot guarantee that proposals, bids and/or construction costs will not vary from this cost estimate.

Legend

SEE FIS REPORT FOR DETAILED LEGEND AND INDEX MAP FOR FIRM PANEL LAYOUT

SPECIAL FLOOD HAZARD AREAS

- Without Base Flood Elevation (BFE) Zone A, V, A99
- With BFE or Depth Zone AE, AO, AH, VE, AR
- Regulatory Floodway

- 0.2% Annual Chance Flood Hazard, Areas of 1% annual chance flood with average depth less than one foot or with drainage areas of less than one square mile Zone X
- Future Conditions 1% Annual Chance Flood Hazard Zone X
- Area with Reduced Flood Risk due to Levee. See Notes. Zone X
- Area with Flood Risk due to Levee Zone D

OTHER AREAS OF FLOOD HAZARD

- NO SCREEN Area of Minimal Flood Hazard Zone X
- Effective LOMRs

- Area of Undetermined Flood Hazard Zone D

OTHER AREAS

- Channel, Culvert, or Storm Sewer
- Levee, Dike, or Floodwall

GENERAL STRUCTURES

- Cross Sections with 1% Annual Chance Water Surface Elevation
- Coastal Transect
- Base Flood Elevation Line (BFE)
- Limit of Study
- Jurisdiction Boundary
- Coastal Transect Baseline
- Profile Baseline
- Hydrographic Feature

MAP PANELS

- Digital Data Available
- No Digital Data Available
- Unmapped

The pin displayed on the map is an approximate point selected by the user and does not represent an authoritative property location.

This map complies with FEMA's standards for the use of digital flood maps if it is not void as described below. The basemap shown complies with FEMA's basemap accuracy standards

The flood hazard information is derived directly from the authoritative NFHL web services provided by FEMA. This map was exported on 2/8/2019 at 7:27:28 PM and does not reflect changes or amendments subsequent to this date and time. The NFHL and effective information may change or become superseded by new data over time.

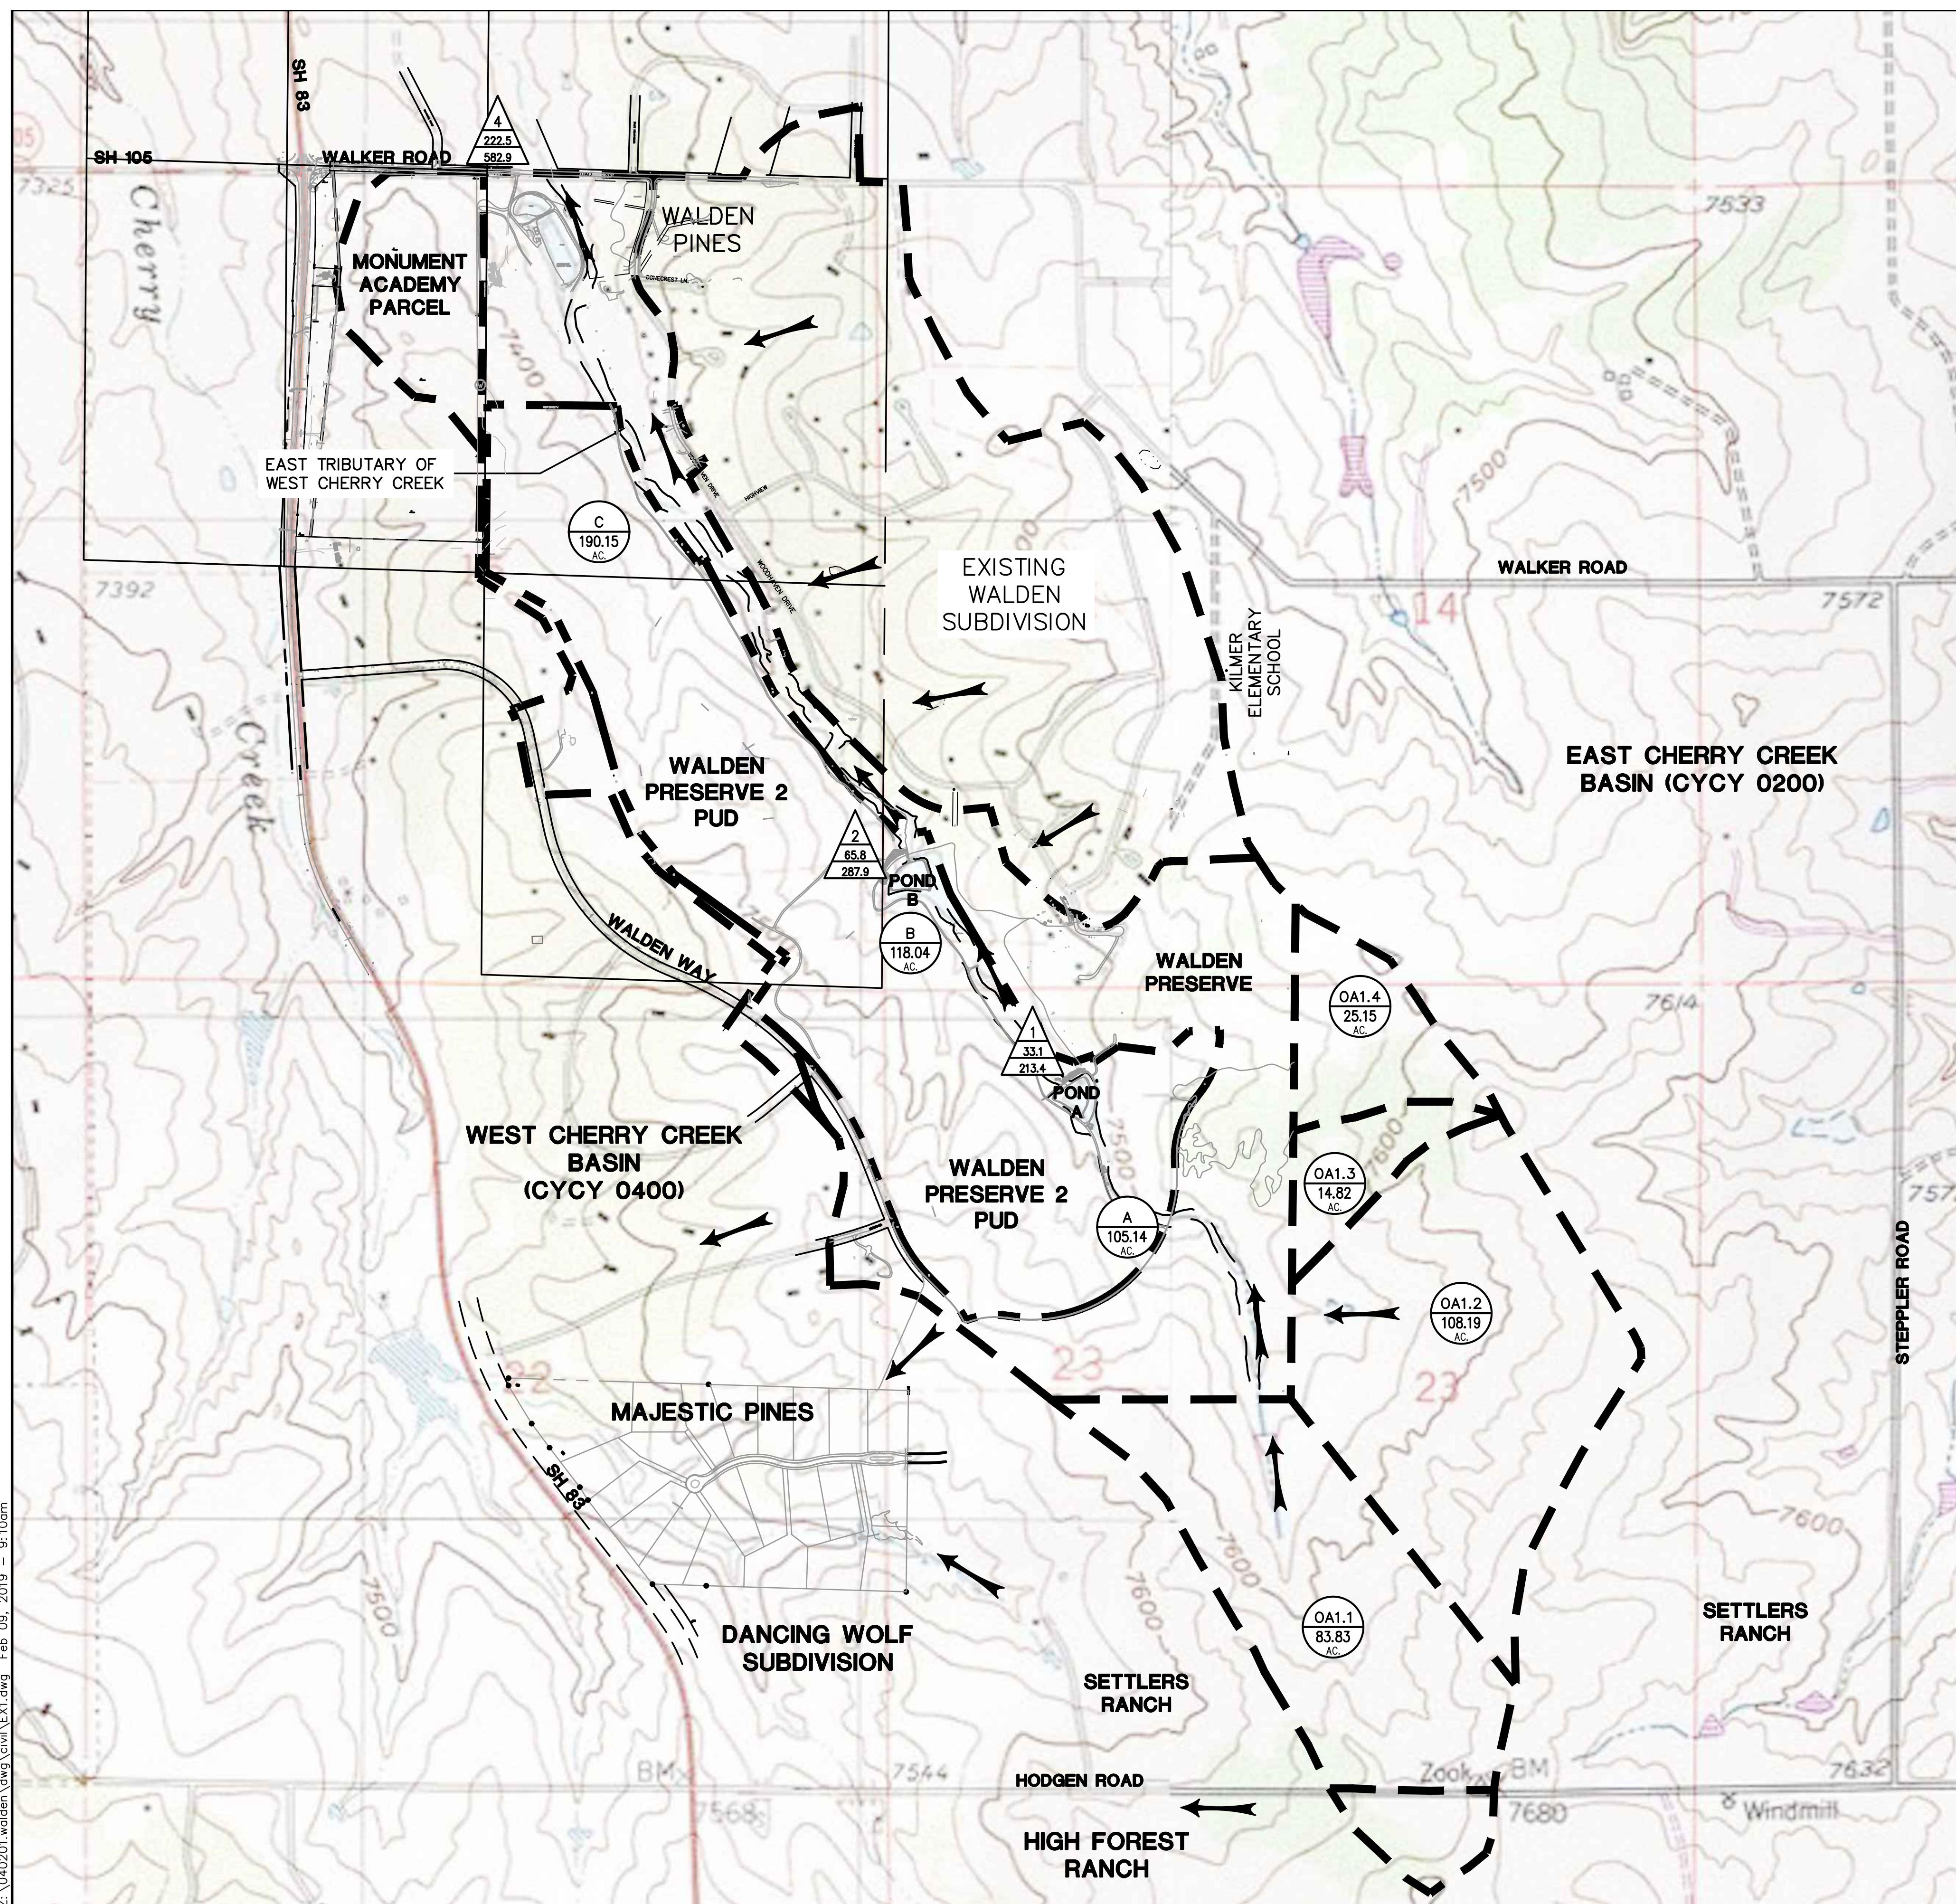

This map image is void if the one or more of the following map elements do not appear: basemap imagery, flood zone labels, legend, scale bar, map creation date, community identifiers, FIRM panel number, and FIRM effective date. Map images for unmapped and unmodernized areas cannot be used for regulatory purposes.

ORIGINE PLATE NOTES

- ORIFICE PLATE NOTES:**

 1. MINIMIZE THE NUMBER OF COLUMNS.
 2. PROVIDE GASKET MATERIAL BETWEEN THE ORIFICE PLATE AND CONCRETE.
 3. BOLT PLATE TO CONCRETE 12" MAX. ON CENTER.

EURV AND WQCV TRASH RACKS:

 1. WELL-SCREEN TRASH RACKS (FOR CIRCULAR ORIFICES) SHALL BE STAINLESS STEEL AND SHALL BE ATTACHED BY INTERMITTENT WELDS ALONG THE EDGE OF THE MOUNTING FRAME.
 2. STRUCTURAL DESIGN OF TRASH RACKS SHALL BE BASED ON FULL HYDROSTATIC HEAD WITH ZERO HEAD DOWNSTREAM OF THE RACK.

OVERFLOW TRASH RACKS:

 1. ALL TRASH RACKS SHALL BE MOUNTED USING STAINLESS STEEL HARDWARE AND PROVIDED WITH HINGED AND LOCKABLE OR BOLTABLE ACCESS PANELS.
 2. TRASH RACKS SHALL BE STAINLESS STEEL, ALUMINUM, OR STEEL. STEEL TRASH RACKS SHALL BE HOT DIP GALVANIZED AND MAY BE HOT POWDER COATED AFTER GALVANIZING.
 3. TRASH RACKS SHALL BE DESIGNED SUCH THAT THE DIAGONAL DIMENSION OF EACH OPENING IS SMALLER THAN THE DIAMETER OF THE OUTLET PIPE.
 4. STRUCTURAL DESIGN OF TRASH RACKS SHALL BE BASED ON FULL HYDROSTATIC HEAD WITH ZERO HEAD DOWNSTREAM OF THE RACK.
