DRAINAGE STATEMENT

Engineer's Statement:

The attached drainage plan and report were prepared under my direction and supervision and are correct to the best of my knowledge and belief. Said drainage report has been prepared according to the criteria established by the County for drainage reports and said report is in conformity with the master plan of the drainage basin. I accept responsibility for liability caused by negligent acts, errors or omissions on my part in preparing this report.

---

John P. Schwab, P.E. #29891

Developer's Statement:

I, the developer have read and will comply with all of the requirements specified in this drainage report and plan.

By:

## I. INTRODUCTION

El Paso County Assessors information shows 1.91 acres.

### A. Property Location and Description

Ute Pass Rental Inc. (Owner) is planning to re-develop their existing open storage site to construct a new enclosed Storage Facility on a developed 1.8-acre property (El Paso County Assessor's Parcel No. 83153-00-029) located at 8775 W. Highway 24 (US24) in western El Paso County, Colorado. The site is zoned Community Commercial (CC). The property is an unplatted tract described as a Tract in the Northeast Quarter of the Southwest Quarter of Section 15, Township 13S, Range 68W of the 6<sup>th</sup> P.M., El Paso County, Colorado.

zoned CC RT

The north boundary of the property adjoins US Highway 24, and the west boundary of this site adjoins an existing commercial property owned by the same Owner. The southeast and southwest boundaries of the site adjoin unplatted residential properties, and the main channel of Upper Fountain Creek flows southeasterly across the southwest part of the property.

show limits of floodplain

The proposed Site Development Plan consists of demolishing an existing barn building within the property and constructing six new storage buildings, with a total of 69 enclosed storage units, along with associated parking and site access. The site access will continue to be provided by the existing private access drive on Highway 24 at the northwest corner of the site.

the LOI states there is a berm around the top of the slope. If one exists, please show and describe.

The total disturbed area associated with this project is approximately 0.73 acres. Since the disturbed area is less than one acre and this project is not part of a larger common plan of development, no stormwater detention or water quality facilities are required.

### B. Scope

In support of the Site Development Plan submittal to El Paso County, this report is intended to meet the requirements of a Final Drainage Report in accordance with El Paso County drainage criteria. This report will provide a summary of site drainage issues impacting the proposed development. The report will analyze impacts from upstream drainage patterns, site-specific developed drainage patterns, and impacts on downstream facilities. This report is based on the guidelines and criteria presented in the City of Colorado Springs and El Paso County "Drainage Criteria Manual."

### C. References

## II. EXISTING DRAINAGE CONDITIONS

As shown on the enclosed Historic Drainage Plan (Sheet EX1, Appendix C), the site has been delineated as two on-site drainage basins. The developed area of higher ground in the northwest part of the property has been delineated as Basin A, and the remaining undeveloped area sloping downwards to the Upper Fountain Creek drainage channel has been delineated as Basin B. The site development area is not impacted by any off-site drainage basins.

The existing site topography within Basin A generally slopes downward to the southeast with grades in the range of 1-3 percent. The existing site topography within Basin B slopes downward to the south with grades in the range of 30-40 percent. According to the Natural Resources Conservation Service (NRCS) Soil Survey for this site, on-site soils are comprised of "Tecolote very gravelly sandy loam soils," and these well-drained soils are classified as hydrologic soils group "B" (see Appendix A).

Historic Basin A sheet flows southeasterly towards the existing drainage swale in the southeast part of the site. The existing site within Basin A is developed with two commercial buildings and the site is covered by compacted gravel. Historic drainage from Basin A flows to Design Point #1, with peak flows calculated as  $Q_5 = 1.9$  cfs and  $Q_{100} = 3.7$  cfs. please describe where the flow goes after design point 1.

Historic Basin B generally sheet flows to the south. Historic drainage from Basin B flows to Design Point #2, with peak flows calculated as  $Q_5 = 0.4$  cfs and  $Q_{100} = 3.2$  cfs.

The FEMA Flood Insurance Study (FIS) identifies peak 100-year flows of approximately 8,880 cfs in the main channel of Upper Fountain Creek upstream of this site. As such, on-site flows are negligible in comparison to the flow in the main channel.

## III. PROPOSED DRAINAGE CONDITIONS

As shown on the enclosed Drainage Plan (Figure D1, Appendix C), the developed site has been delineated as two on-site drainage basins, consistent with the historic drainage analysis. Developed flows have been calculated based on the impervious areas associated with the proposed re-development plan. The proposed building improvements will be limited to the existing compacted gravel storage area in the northeast part of the property (Basin A), and developed flows from the site will follow historic drainage patterns to the existing drainage swale at the southeast corner of the property.

Recognizing the historic commercial development of this site, the proposed storage buildings and related site improvements will not result in a significant developed drainage impact. The proposed site development will generally maintain historic drainage conditions.

Developed Basins A1 and A2 (northwest part of property) will continue to drain southeasterly to the existing drainage channel at the southeast corner of the site. The proposed grading plan for the Storage Site will provide positive drainage away from each building and direct surface flows to drainage swales between storage buildings, flowing southeasterly to a pair of private storm inlets near the southeast corner of Basin A1.

Private Storm Inlets A1.1 (Double Type 13) and A1.2 (Type 16) will intercept surface drainage from the parking area, and Private Storm Sewer A1.1-A1.2 (15") will flow southeasterly to daylight in the existing drainage channel at the toe of the existing embankment. A concrete energy dissipater will be provided at the storm drain outlet. In the event of clogging of Inlets A1.1 and A1.2, the drainage swale between storage buildings will provide an emergency overflow path to the southeasterly embankment. Developed peak flows at Design Point #A1 are calculated as  $Q_5 = 2.0$  cfs and  $Q_{100} = 3.9$  cfs.

Please show on the drainage map where design points A1 and A2 are located.

Basin A2 comprises the frontage of the property, which sheet flows southeasterly to the existing drainage channel at the southeast corner of the property. Developed peak flows at Design Point #A2 are calculated as  $Q_5 = 0.7$  cfs and  $Q_{100} = 1.2$  cfs.

Developed flows from Basins A1 and A2 combine at Design Point #1, with peak flows calculated as  $Q_5 = 2.7$  cfs and  $Q_{100} = 5.1$  cfs, representing a negligible increase in comparison to historic conditions.

Developed Basin B (southeast part of property) will continue to sheet flow to the south, following historic drainage patterns. Developed peak flows at Design Point #2 are calculated as  $Q_5 = 0.4$  cfs and  $Q_{100} = 3.2$  cfs (no change in comparison to historic flows).

The proposed site improvements will involve less than one acre of site disturbance and the project is not part of a larger common plan of development, so there is no requirement for permanent stormwater quality measures. In addition, the total developed site is less than one acre in size, and therefore on-site detention is not required.

The contractor will be required to implement standard best management practices for erosion control during construction.

Hydrologic calculations for the site are detailed in the attached spreadsheets (Appendix A), and peak flows are identified on Figures EX1 and D1 (Appendix C).

inconsistent with GEC plan and proposed conditions map.

Please show enough information so that the reviewer can understand where the flow goes after leaving your property. It appears as if the FES is pointing right at the adjacent property's driveway then to their home. please show floodplain.

#### **IV. DRAINAGE PLANNING FOUR STEP PROCESS**

El Paso County Drainage Criteria require drainage planning to include a Four Step Process for receiving water protection that focuses on reducing runoff volumes, treating the water quality capture volume (WQCV), stabilizing drainageways, and implementing long-term source controls.

As stated in DCM Volume 2, the Four Step Process is applicable to all new and re-development projects with construction activities that disturb 1 acre or greater or that disturb less than 1 acre but are part of a larger common plan of development. The Four Step Process has been implemented as follows in the planning of this project:

##### Step 1: Employ Runoff Reduction Practices

- **Minimize Impacts:** The proposed site re-development project will inherently minimize drainage impacts in comparison to development of a vacant site. Recognizing the existing compacted gravel covering the developed part of the site, the proposed re-development will result in a minimal net increase in impervious site development.
- **Infill Development:** The nature of this project, consisting of site improvements to a previously developed commercial property adjoining an improved public street, is an inherently low impact development.

##### Step 2: Stabilize Drainageways

- No direct impacts are proposed to the existing Fountain Creek channel flowing across the southwest corner of the property. This site is a re-development project, and the relatively small net increase in impervious area will minimize impacts to the existing drainage channel.

##### Step 3: Provide Water Quality Capture Volume (WQCV)

- WQCV BMPs are not required for this site since the disturbed areas is less than one acre and the project site is not part of a larger common plan of development.

##### Step 4: Consider Need for Industrial and Commercial BMPs

- The proposed commercial development project will implement a Stormwater Management Plan including proper housekeeping practices and spill containment procedures.

#### **V. FLOODPLAIN IMPACTS**

Floodplain limits in vicinity of this site are delineated in the applicable Flood Insurance Rate Map, FIRM Panel No. 08041C0490F dated March 17, 1997.

As depicted in the FIRM exhibit enclosed in Appendix C, while the 100-year floodplain along Fountain Creek impacts Basin B, the developed part of the site (Basin A), is not impacted by any delineated 100-year FEMA floodplains.

## **VI. STORMWATER DETENTION AND WATER QUALITY**

The total disturbed area associated with this project is approximately 0.73 acres. Since the disturbed area is less than one acre and the project site is not part of a larger common plan of development, no stormwater detention or water quality facilities are required.

## **VII. DRAINAGE BASIN FEES**

Re-development of this commercial site will include construction of private storm sewer improvements within the property. No public drainage improvements are required.

The site lies entirely within the Fountain Creek Drainage Basin. According to the published table of "El Paso County Drainage Basin Fees," the Fountain Creek basin is not subject to drainage or bridge fees. As such, no drainage or bridge fees are required.

## **VIII. SUMMARY**

The developed drainage patterns associated with the proposed Ute Pass Storage site re-development project at 8775 W. Highway 24 will remain consistent with historic conditions and the overall drainage plan for this area. The proposed site improvements will involve less than one acre of site disturbance and the project is not part of a larger common plan of development, so there is no requirement for permanent stormwater quality measures or stormwater detention. The minimal increase in developed flow is negligible in comparison to the flow in the Upper Fountain Creek channel. Construction and proper maintenance of the proposed on-site drainage facilities, in conjunction with proper erosion control practices, will ensure that the proposed site development has no significant adverse drainage impact on downstream or surrounding areas.

**APPENDIX A**  
**HYDROLOGIC CALCULATIONS**

Hydrologic Soil Group—Pike National Forest, Eastern Part, Colorado, Parts of Douglas, El Paso, Jefferson, and Teller Counties  
(Ute Pass Storage)

Soil Map may not be valid at this scale.

Map Scale: 1:982 if printed on A landscape (11" x 8.5") sheet.

## MAP LEGEND

## MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

 Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Pike National Forest, Eastern Part, Colorado, Parts of Douglas, El Paso, Jefferson, and Teller Counties  
 Survey Area Data: Version 4, Oct 12, 2017

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Feb 22, 2014—Mar 9, 2017

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

## Hydrologic Soil Group

Map unit symbol	Map unit name	Rating	Acres in AOI	Percent of AOI
2	Aquolls, 1 to 10 percent slopes	A/D	0.1	4.5%
48	Tecolote very gravelly sandy loam, 15 to 40 percent slopes, very stony	B	1.7	95.5%
<b>Totals for Area of Interest</b>			<b>1.8</b>	<b>100.0%</b>

### Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

## Rating Options

*Aggregation Method:* Dominant Condition

*Component Percent Cutoff:* None Specified

*Tie-break Rule:* Higher

### 3.2 Time of Concentration

One of the basic assumptions underlying the Rational Method is that runoff is a function of the average rainfall rate during the time required for water to flow from the hydraulically most remote part of the drainage area under consideration to the design point. However, in practice, the time of concentration can be an empirical value that results in reasonable and acceptable peak flow calculations.

For urban areas, the time of concentration ( $t_c$ ) consists of an initial time or overland flow time ( $t_i$ ) plus the travel time ( $t_r$ ) in the storm sewer, paved gutter, roadside drainage ditch, or drainage channel. For non-urban areas, the time of concentration consists of an overland flow time ( $t_i$ ) plus the time of travel in a concentrated form, such as a swale or drainageway. The travel portion ( $t_r$ ) of the time of concentration can be estimated from the hydraulic properties of the storm sewer, gutter, swale, ditch, or drainageway. Initial time, on the other hand, will vary with surface slope, depression storage, surface cover, antecedent rainfall, and infiltration capacity of the soil, as well as distance of surface flow. The time of concentration is represented by Equation 6-7 for both urban and non-urban areas.

$$t_c = t_i + t_t \quad (\text{Eq. 6-7})$$

Where:

$t_c$  = time of concentration (min)

$t_i$  = overland (initial) flow time (min)

$t_t$  = travel time in the ditch, channel, gutter, storm sewer, etc. (min)

### 3.2.1 Overland (Initial) Flow Time

The overland flow time,  $t_i$ , may be calculated using Equation 6-8.

$$t_i = \frac{0.395(1.1 - C_5)\sqrt{L}}{S^{0.33}} \quad (\text{Eq. 6-8})$$

Where:

$t_i$  = overland (initial) flow time (min)

$C_5$  = runoff coefficient for 5-year frequency (see Table 6-6)

$L$  = length of overland flow (300 ft maximum for non-urban land uses, 100 ft maximum for urban land uses)

$S$  = average basin slope (ft/ft)

Note that in some urban watersheds, the overland flow time may be very small because flows quickly concentrate and channelize.

### 3.2.2 Travel Time

For catchments with overland and channelized flow, the time of concentration needs to be considered in combination with the travel time,  $t_t$ , which is calculated using the hydraulic properties of the swale, ditch, or channel. For preliminary work, the overland travel time,  $t_t$ , can be estimated with the help of Figure 6-25 or Equation 6-9 (Guo 1999).

$$V = C_v S_w^{0.5} \quad (\text{Eq. 6-9})$$

Where:

$V$  = velocity (ft/s)

$C_v$  = conveyance coefficient (from Table 6-7)

$S_w$  = watercourse slope (ft/ft)

**Table 6-7. Conveyance Coefficient,  $C_v$** 

Type of Land Surface	$C_v$
Heavy meadow	2.5
Tillage/field	5
Riprap (not buried)*	6.5
Short pasture and lawns	7
Nearly bare ground	10
Grassed waterway	15
Paved areas and shallow paved swales	20

\* For buried riprap, select  $C_v$  value based on type of vegetative cover.

The travel time is calculated by dividing the flow distance (in feet) by the velocity calculated using Equation 6-9 and converting units to minutes.

The time of concentration ( $t_c$ ) is then the sum of the overland flow time ( $t_i$ ) and the travel time ( $t_t$ ) per Equation 6-7.

### 3.2.3 First Design Point Time of Concentration in Urban Catchments

Using this procedure, the time of concentration at the first design point (typically the first inlet in the system) in an urbanized catchment should not exceed the time of concentration calculated using Equation 6-10. The first design point is defined as the point where runoff first enters the storm sewer system.

$$t_c = \frac{L}{180} + 10 \quad (\text{Eq. 6-10})$$

Where:

$t_c$  = maximum time of concentration at the first design point in an urban watershed (min)

$L$  = waterway length (ft)

Equation 6-10 was developed using the rainfall-runoff data collected in the Denver region and, in essence, represents regional “calibration” of the Rational Method. Normally, Equation 6-10 will result in a lesser time of concentration at the first design point and will govern in an urbanized watershed. For subsequent design points, the time of concentration is calculated by accumulating the travel times in downstream drainageway reaches.

### 3.2.4 Minimum Time of Concentration

If the calculations result in a  $t_c$  of less than 10 minutes for undeveloped conditions, it is recommended that a minimum value of 10 minutes be used. The minimum  $t_c$  for urbanized areas is 5 minutes.

### 3.2.5 Post-Development Time of Concentration

As Equation 6-8 indicates, the time of concentration is a function of the 5-year runoff coefficient for a drainage basin. Typically, higher levels of imperviousness (higher 5-year runoff coefficients) correspond to shorter times of concentration, and lower levels of imperviousness correspond to longer times of

**Figure 6-5. Colorado Springs Rainfall Intensity Duration Frequency**

**IDF Equations**

$$I_{100} = -2.52 \ln(D) + 12.735$$

$$I_{50} = -2.25 \ln(D) + 11.375$$

$$I_{25} = -2.00 \ln(D) + 10.111$$

$$I_{10} = -1.75 \ln(D) + 8.847$$

$$I_5 = -1.50 \ln(D) + 7.583$$

$$I_2 = -1.19 \ln(D) + 6.035$$

Note: Values calculated by equations may not precisely duplicate values read from figure.

## INLET IN A SUMP OR SAG LOCATION

Version 4.05 Released March 2017

Design Information (Input)	MINOR	MAJOR	
Type of Inlet	CDOT/Denver 13 Valley Grate		
Local Depression (additional to continuous gutter depression 'a' from above)	2.00	2.00	inches
Number of Unit Inlets (Grate or Curb Opening)	2	2	
Water Depth at Flowline (outside of local depression)	6.0	6.0	inches
<b>Grate Information</b>	MINOR	MAJOR	<input type="checkbox"/> Override Depths
Length of a Unit Grate	3.00	3.00	feet
Width of a Unit Grate	1.73	1.73	feet
Area Opening Ratio for a Grate (typical values 0.15-0.90)	0.43	0.43	
Clogging Factor for a Single Grate (typical value 0.50 - 0.70)	0.50	0.50	
Grate Weir Coefficient (typical value 2.15 - 3.60)	3.30	3.30	
Grate Orifice Coefficient (typical value 0.60 - 0.80)	0.60	0.60	
<b>Curb Opening Information</b>	MINOR	MAJOR	
Length of a Unit Curb Opening	N/A	N/A	feet
Height of Vertical Curb Opening in Inches	N/A	N/A	inches
Height of Curb Orifice Throat in Inches	N/A	N/A	inches
Angle of Throat (see USDCM Figure ST-5)	N/A	N/A	degrees
Side Width for Depression Pan (typically the gutter width of 2 feet)	N/A	N/A	feet
Clogging Factor for a Single Curb Opening (typical value 0.10)	N/A	N/A	
Curb Opening Weir Coefficient (typical value 2.3-3.7)	N/A	N/A	
Curb Opening Orifice Coefficient (typical value 0.60 - 0.70)	N/A	N/A	
<b>Low Head Performance Reduction (Calculated)</b>	MINOR	MAJOR	
Depth for Grate Midwidth	0.523	0.523	ft
Depth for Curb Opening Weir Equation	N/A	N/A	ft
Combination Inlet Performance Reduction Factor for Long Inlets	N/A	N/A	
Curb Opening Performance Reduction Factor for Long Inlets	N/A	N/A	
Grated Inlet Performance Reduction Factor for Long Inlets	0.71	0.71	
<b>Total Inlet Interception Capacity (assumes clogged condition)</b>	MINOR	MAJOR	
Inlet Capacity IS GOOD for Minor and Major Storms(>Q PEAK)	3.6	3.6	cfs
Q PEAK REQUIRED =	1.8	3.5	cfs

# Hydraulic Analysis Report

## Project Data

Project Title: Ute Pass Storage  
Designer: JPS  
Project Date: Saturday, February 10, 2018  
Project Units: U.S. Customary Units  
Notes:

## Channel Analysis: SD-A1.1

Notes:

## Input Parameters

Channel Type: Circular  
Pipe Diameter: 1.2500 ft  
Longitudinal Slope: 0.0200 ft/ft  
Manning's n: 0.0130  
Depth: 1.2500 ft

## Result Parameters

Flow: 9.1355 cfs  
Area of Flow: 1.2272 ft<sup>2</sup>  
Wetted Perimeter: 3.9270 ft  
Hydraulic Radius: 0.3125 ft  
Average Velocity: 7.4443 ft/s  
Top Width: 0.0000 ft  
Froude Number: 0.0000  
Critical Depth: 1.1597 ft  
Critical Velocity: 7.6924 ft/s  
Critical Slope: 0.0173 ft/ft  
Critical Top Width: 0.65 ft  
Calculated Max Shear Stress: 1.5600 lb/ft<sup>2</sup>  
Calculated Avg Shear Stress: 0.3900 lb/ft<sup>2</sup>

## Channel Analysis: SD-A1.2

Notes:

### Input Parameters

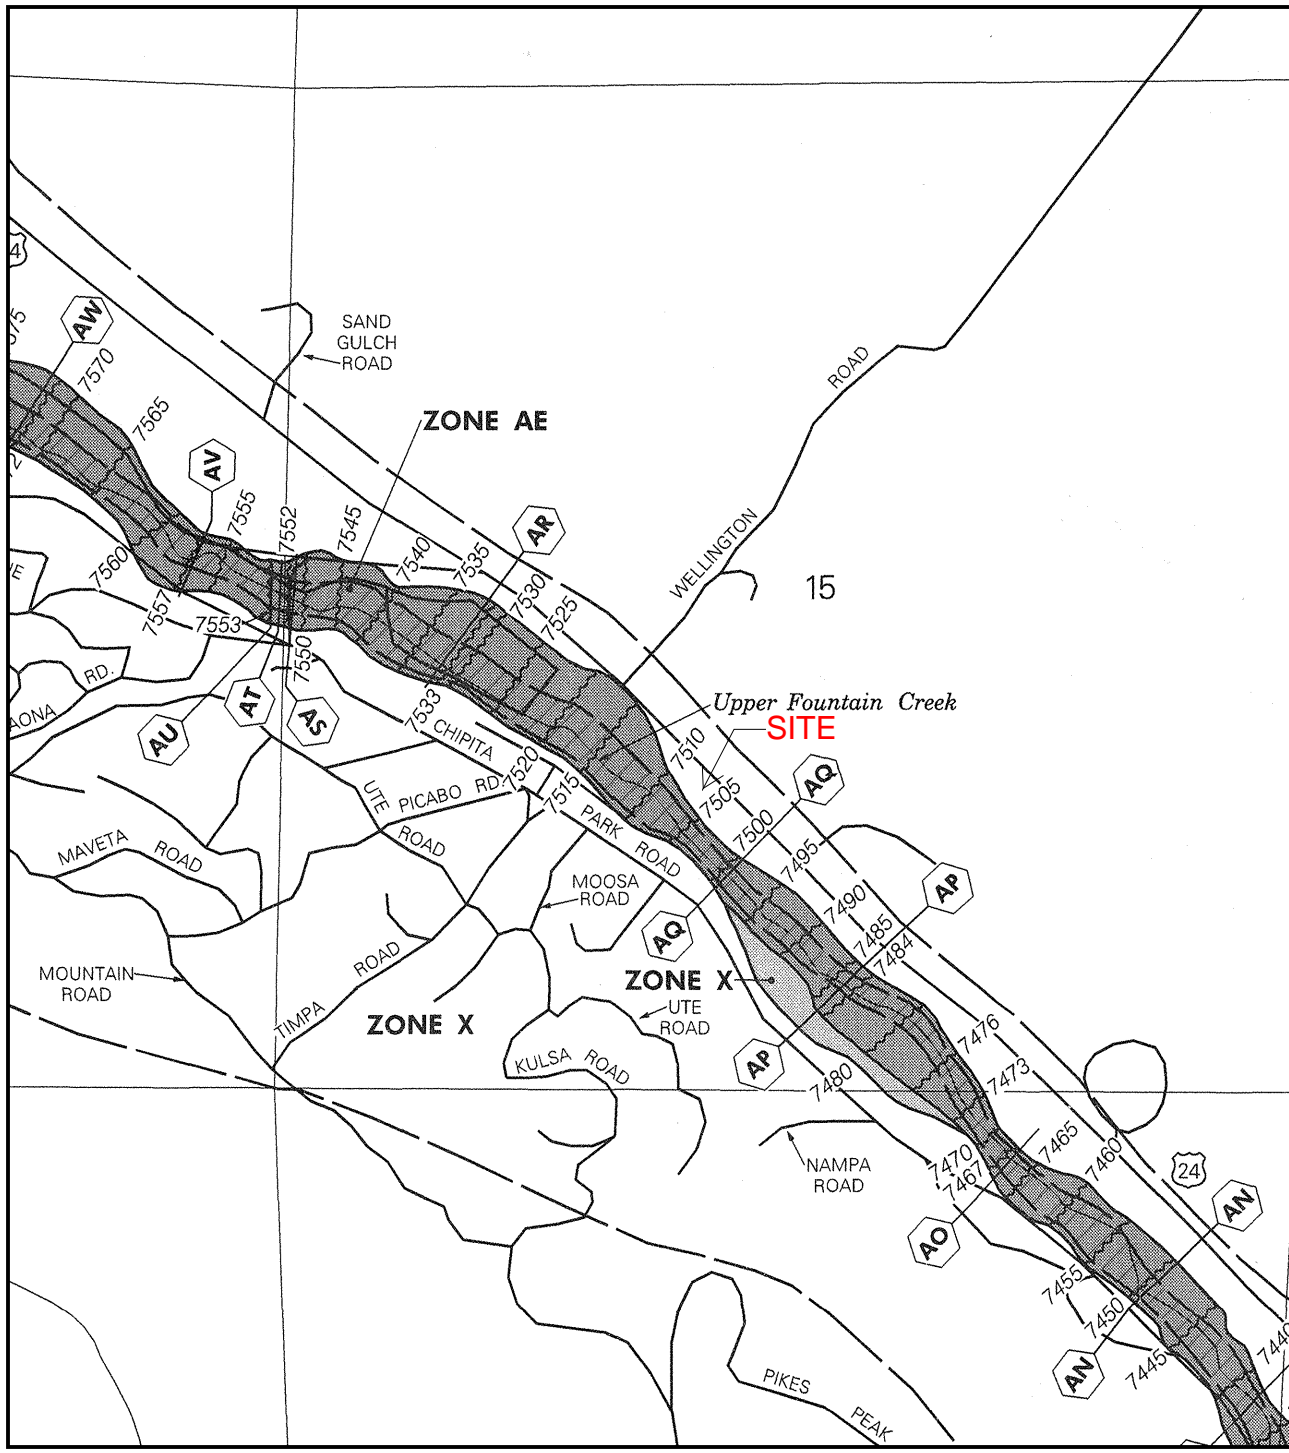

Channel Type: Circular  
Pipe Diameter: 1.2500 ft  
Longitudinal Slope: 0.0200 ft/ft  
Manning's n: 0.0130  
Depth: 1.2500 ft

### Result Parameters

Flow: 9.1355 cfs  
Area of Flow: 1.2272 ft<sup>2</sup>  
Wetted Perimeter: 3.9270 ft  
Hydraulic Radius: 0.3125 ft  
Average Velocity: 7.4443 ft/s  
Top Width: 0.0000 ft  
Froude Number: 0.0000  
Critical Depth: 1.1597 ft  
Critical Velocity: 7.6924 ft/s  
Critical Slope: 0.0173 ft/ft  
Critical Top Width: 0.65 ft  
Calculated Max Shear Stress: 1.5600 lb/ft<sup>2</sup>  
Calculated Avg Shear Stress: 0.3900 lb/ft<sup>2</sup>
