Meadowbrook Crossing Updated Traffic Impact Study (LSC #164430) May 5, 2017

Traffic Engineer's Statement

This traffic report and supporting information were prepared under my responsible charge and they comport with the standard of care. So far as is consistent with the standard of care, said report was prepared in general conformance with the criteria established by the County for traffic reports.

RE: Meadowbrook Crossing
El Paso County, Colorado
Updated Traffic Impact Study
LSC #164430

Dear Mr. Mientka:

In response to your request, LSC Transportation Consultants, Inc. has prepared this updated traffic impact analysis for the proposed Meadowbrook Crossing residential development to be located northwest of the State Highway 24/State Highway 94/Meadowbrook Parkway intersection in El Paso County, Colorado. The site location is shown in Figure 1. This report has been prepared to accompany the Preliminary Plan and Subdivision Plat submittals to the El Paso County Planning and Community Development Department.

LAND USE AND ACCESS

Land Use

The site is located north of where Meadowbrook Parkway currently makes a 90-degree turn. The site is planned to be developed with lots for 114 single-family homes. A gas station is currently proposed for the parcel south of the site and east of Meadowbrook Parkway. The parcel located south of the site and west of Meadowbrook Parkway is currently zoned for commercial uses, however there is potential that this site may be developed for residential uses similar to the currently proposed Meadowbrook Crossing.

Proposed Access Locations

Two access points to Meadowbrook Parkway are proposed. One access point would align with the segment of Meadowbrook Parkway that connects to the US Highway 24 intersection. The second access point would be located 765 feet to the northeast. Both access points are to Meadowbrook Parkway due to the site configuration and natural constraints.

The subdivision plat includes a 40-foot dedication to El Paso County along the southern boundary to be used for the right-of-way and extension of Meadowbrook Parkway to the west.

The site plan upon which this study is based is shown in Figure 2. The site plan shows how this development would convert this 90-degree turn into a three-leg intersection with a site access forming the northwest leg of the intersection. A second full-movement access point is proposed to Meadowbrook Parkway 765 feet to the east.

INTERSECTION SIGHT DISTANCE

Figure 3 shows the required intersection sight distance lines at the two proposed access points based on the criteria contained in Table 2-21 of the *El Paso County Engineering Criteria Manual (ECM)*. Landscaping, fencing, and all other obstructions should be kept outside of these intersection lines of sight.

ROADWAY AND TRAFFIC CONDITIONS

Area Roadways

The area roadways in the site's vicinity are shown on Figure 1 and are described below.

- **US Highway 24 (US 24)** is a state highway extending locally from the City of Colorado Springs to Peyton in a northeasterly direction and then continuing east. US 24 is classified as an Expressway by the Colorado Department of Transportation (CDOT) in the vicinity of the site and is shown as an Expressway on the El Paso County *Major Transportation Corridors Plan (MTCP)*.
- **State Highway 94 (US 94)** is a State Highway that extends east from the intersection of US 24 and Meadowbrook Parkway to State Highway 40. US 94 is classified as an Expressway by CDOT in the vicinity of the site and is shown as an Expressway on the El Paso County MTCP.
- **Meadowbrook Parkway** is a paved, 52-foot-wide Non-Residential Collector that extends through the Claremont Ranch Business Park development generally parallel to US 24.

Existing Traffic Volumes

Figure 4 shows the existing peak-hour traffic volumes and existing lane geometries and traffic control at the intersections of State Highway 24/State Highway 94/Meadowbrook Parkway and Marksheffel Road/Meadowbrook Parkway. The traffic volumes are from the attached raw peak-hour traffic counts conducted by LSC in June and October 2016.

Existing Levels of Service

Level of service (LOS) is a quantitative measure of the delay and level of congestion at an intersection. Level of service is indicated on a scale from "A" to "F." LOS A represents control delay of less than 10 seconds for unsignalized and signalized intersections. LOS F represents control delay of more than 50

seconds for unsignalized intersections and more than 80 seconds for signalized intersections. Table 1 shows the level of service delay ranges.

Table 1 Intersection Levels of Service Delay Ranges			
Level of Service	Signalized Intersections		Unsignalized Intersections
	Average Control Delay (seconds per vehicle)	V/C ⁽¹⁾	Average Control Delay (seconds per vehicle) ⁽²⁾
A	10.0 sec or less	less than 0.60	10.0 sec or less
B	10.1-20.0 sec	0.60-0.69	10.1-15.0 sec
C	20.1-35.0 sec	0.70-0.79	15.1-25.0 sec
D	35.1-55.0 sec	0.80-0.89	25.1-35.0 sec
E	55.1-80.0 sec	0.90-0.99	35.1-50.0 sec
F	80.1 sec or more	1.00 and greater	50.1 sec or more

(1) Source: *Transportation Research Circular 212*
(2) For unsignalized intersections if V/C ratio is greater than 1.0 the level of service is LOS F regardless of the projected average control delay per vehicle.

The intersection of US Highway 24/State Highway 94/Meadowbrook Parkway has been analyzed using Synchro. The results of the analysis are shown in Figure 4. As shown on the figure this intersection is currently operating at an acceptable level of service (LOS D or better) during the peak hours. The level of service reports are attached.

The intersection of Marksheffel Road/Meadowbrook Parkway has been analyzed based on the unsignalized method of analysis procedures found in the *Highway Capacity Manual, 2010 Edition* by the Transportation Research Board. The eastbound and westbound approaches at this intersection are currently operating at LOS F during the peak hours.

TRAFFIC SIGNAL WARRANT ANALYSIS

The intersection of Marksheffel Road/Meadowbrook Parkway was analyzed to determine if a Four-Hour Volume Traffic Signal Warrant is currently satisfied based on existing traffic volumes recorded in the field in October 2016. This analysis has been based on procedures and guidelines contained in the 2009 *Manual on Uniform Traffic Control Devices (MUTCD)*. Results of the analysis are shown below in Exhibit 1.

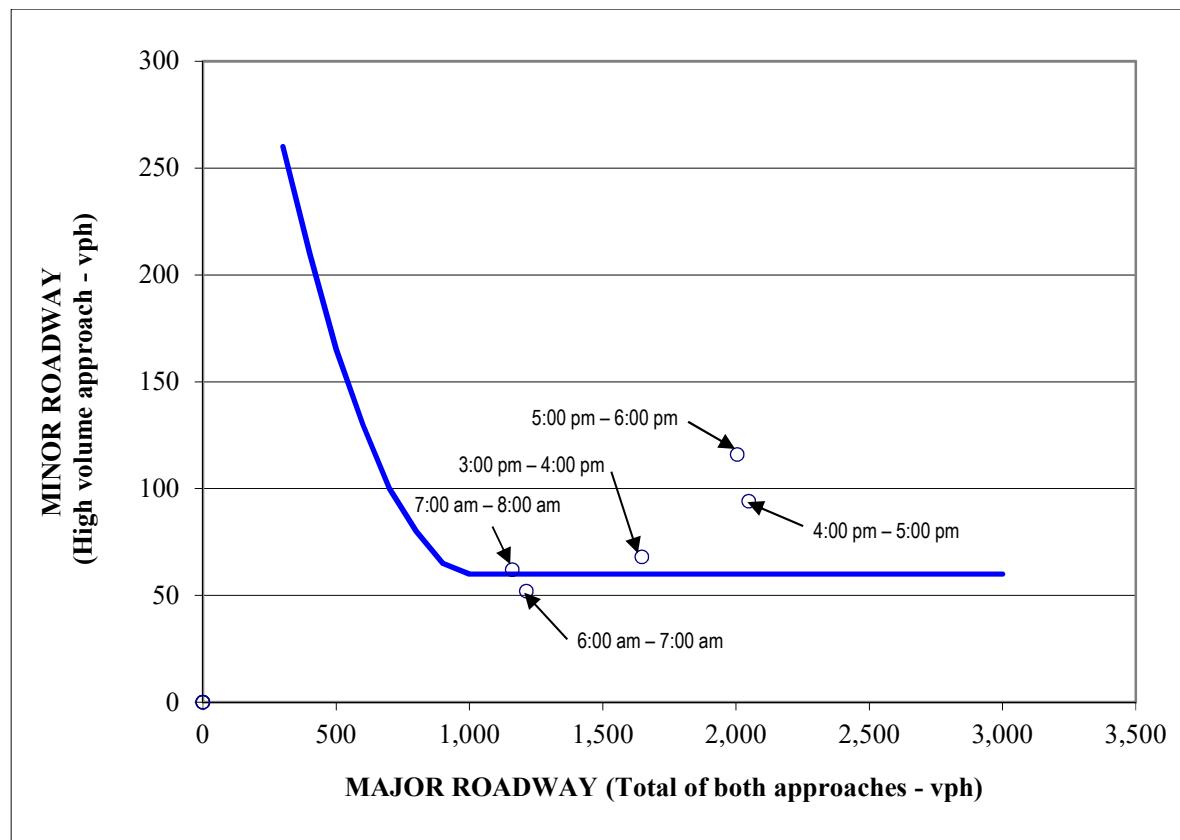

Exhibit 1 – Four-Hour Traffic Signal Warrant

As shown in the exhibit, the Four-Hour Vehicular Volume Traffic Signal Warrant is currently satisfied at this intersection. As this MUTCD signal warrant is currently met, level of service analysis for future traffic scenarios assume this intersection to be signalized.

2020 BACKGROUND TRAFFIC

Figure 5 shows the projected background traffic volumes for the year 2020. Background traffic is the traffic estimated to be on the adjacent streets without consideration of the proposed development. It includes through traffic and traffic generated by adjacent/nearby developments including buildup of the proposed gas station to be located northwest of Meadowbrook Parkway and Marksheffel Road. The traffic volumes estimated to be generated by this development were taken from the *Circle K Store Traffic Impact Analysis* by LSC dated July 31, 2015. Estimates of background traffic on US 24 and SH 94 are based on a growth rate of about two percent per year.

2040 BACKGROUND TRAFFIC

Figures 6 and 7 show the projected background traffic volumes for the year 2040. The background traffic volumes for US 24 and US 94 were based on the latest traffic volume data and 20-year growth factors from the Colorado Department of Transportation.

The background traffic volumes on Meadowbrook Parkway were estimated by LSC based on trip generation estimates for other vacant parcels served by Meadowbrook Parkway between US 24 and Marksheffel Road. To estimate potential additional traffic on Meadowbrook Parkway, the area between US 24 and Marksheffel Road was divided into traffic analysis zones shown in Appendix Figure 1. The land use assumed for each parcel is shown in the appendix table. Two land use scenarios are shown for TAZ 3 located south of the site. The first scenario assumes this site will be developed for retail uses as shown in the *Highway 24/Highway 94 Commercial Rezone Site Updated Traffic Memorandum* by LSC dated April 29, 2014. The 2040 background volumes based on this scenario are shown in Figure 6. The second scenario assumes TAZ 3 will be developed with about 184 single-family homes. The 2040 background volumes based on this scenario are shown in Figure 7. The 2040 background traffic volumes assume Meadowbrook Parkway has been extended west to Peterson Boulevard.

TRIP GENERATION

The site-generated vehicle-trips were estimated using the nationally published trip generation rates from *Trip Generation, 9th Edition, 2012* by the Institute of Transportation Engineers (ITE). Table 2 shows the site's average weekday, morning peak-hour, and afternoon peak-hour trip generation estimates.

The proposed development could be expected to generate about 1,085 new vehicle-trips on the average weekday, with about half entering and half exiting the site during a 24-hour period. During the morning peak hour, which generally occurs for one hour between 6:30 and 8:30 a.m., about 21 vehicles would enter and 64 vehicles would exit the site. During the afternoon peak hour, which generally occurs for one hour between 4:15 and 6:15 p.m., about 72 vehicles would enter and 42 vehicles would exit the site.

DIRECTIONAL DISTRIBUTION AND ASSIGNMENT

The directional distribution of the site-generated traffic volumes on the area roadways is an important factor in determining the site's traffic impacts. Figure 8 shows directional distribution estimates for the site-generated traffic volumes. The estimates have been based on the following factors: the site's location with respect to the nearby employment, commercial, and activity centers.

When the distribution percentages in Figure 8 are applied to the trip generation estimates shown in Table 2, the site-generated traffic volumes on the adjacent streets can be determined. Figures 9 and 10 show the short-term and long-term site-generated traffic volumes, respectively. The short-term site-generated traffic volumes assume the existing street network. The long-term site-generated traffic volumes assume Meadowbrook Parkway has been extended west to Peterson Road.

TOTAL TRAFFIC

Figure 11 shows the 2020 total traffic volumes. The 2020 total traffic volumes are the sum of the short-term site-generated volumes from Figure 9 plus the 2020 background traffic volumes from Figure 5.

Figures 12 and 13 show the 2040 total traffic volumes based on the two potential land use scenarios for the parcel located just west of the site. Figure 12 shows the 2040 total traffic volumes based on Scenario

1, which assumes the parcel just south of the site is developed for retail uses. The volumes are the sum of the 2040 Scenario 1 background volumes from Figure 6 plus the long-term site-generated volumes from Figure 10. Figure 13 shows the 2040 total traffic volumes based on Scenario 2, which assumes the parcel just south of the site is developed for residential uses. The volumes are the sum of the 2040 Scenario 2 background volumes from Figure 7 plus the long-term site-generated volumes from Figure 10.

PROJECTED LEVEL OF SERVICE

The intersection of US 24/US 94/Meadowbrook and the site access points were analyzed to determine the projected levels of service during the peak hours for the 2020 and 2040 background and total traffic volumes. The signalized intersection of US 24/US 94/Meadowbrook was analyzed using Synchro. The site access points were analyzed based on the unsignalized method of analysis procedures from the *Highway Capacity Manual, 2010 Edition*. Figures 5 through 7 and Figures 11 through 13 show the analysis results from the attached level of service reports.

US 24/US 94/Meadowbrook

The intersection of US 24/US 94/Meadowbrook is projected to continue to operate at a satisfactory level of service as a signalized intersection based on the projected 2020 total traffic volumes. By 2040 this intersection is projected to operate at LOS D during the morning peak hour and LOS C during the afternoon peak hour based on both the projected background and total traffic volumes assuming the parcel south of the site is developed for either retail or residential uses. As shown in Figures 6, 7, 12 and 13, some of the minor movements are projected to operate at LOS E in both the background and total traffic analyses. Based on these projected high through volumes on US 24 and the high westbound left-turn volumes from Highway 94, the intersection would need to be upgraded to a grade-separated intersection in order to meet county standards for LOS regardless of this development. The PPACG 2040 plan shows the intersection of Highway 24/Marksheffel as a grade-separated interchange, but not this intersection.

Funding for the future grade-separated interchange at this intersection of two state highways will be a regional improvement that should not be the responsibility of this development. It will be the high critical movements on the state highways identified above that will eventually cause the at-grade intersection to have an LOS below CDOT and county standards.

Marksheffel/Meadowbrook

The intersection of Marksheffel/Meadowbrook is currently two-way stop-sign controlled. The eastbound and westbound approaches are currently operating at LOS F during the peak hours. As discussed in the Traffic Signal Warrant Analysis section above, this intersection currently meets a Four-Hour Vehicular Volume Traffic Signal Warrant. This intersection was therefore analyzed as a signalized intersection for the short-term and 2040 background and total scenarios. Based on the short-term total traffic volumes the overall intersection is projected to operate at LOS B and all movements are projected to operate at LOS D or better during the peak hours. By 2040, the eastbound left-turn and westbound through and left-turn movements are projected to operate at LOS E during the afternoon peak hour based on 2040

background and total traffic assuming both Scenario 1 and Scenario 2 development. These movements have projected delays in the LOS E range simply because they arrive at the traffic signal at the beginning of the red phase at an intersection with many phases and a long cycle length. These movements would not be considered “failing” since their volume-to-capacity ratios are less than one. The justification is that to progress through traffic along an arterial corridor, the traffic signal offsets and left-turn phase times have been adjusted to favor the through band, which can result in higher delay for the left-turn movements even though there is sufficient capacity for them.

Meadowbrook/Newt Drive

Currently Meadowbrook Parkway extends northwest from the intersection of US 24/SH 94 for about 500 feet and then makes a 90-degree turn and continues northeast to Marksheffel Road. This intersection is planned to be reconstructed as a three-leg intersection with this development. This intersection is projected to operate at a satisfactory level of service (LOS B or better) as a stop-sign-controlled intersection based on the projected 2020 total traffic volumes.

In the future Meadowbrook Parkway is planned to be extended west to Peterson Boulevard. Based on the 2040 background volumes, the intersection may need to be signalized (if warrants are met) in the future with traffic generation (background traffic) by other area parcels as the northbound and southbound left-turn movements show level of service F. Figures 12 and 13 show the lane geometry assumed in the analysis.

East Site Access Point

All movements at the east site access point to Meadowbrook Parkway are projected to operate at a satisfactory level of service (LOS C or better) based on the projected 2020 and 2040 Scenario 1 and Scenario 2 total traffic volumes assuming these intersections are Stop-sign controlled.

RECOMMENDED STREET CLASSIFICATIONS

All streets within this subdivision should be classified as Urban Local streets.

COUNTYWIDE ROAD IMPROVEMENT FEE PROGRAM

The applicant will be required to participate in the County Road Impact Fee Program. The applicant proposes to have this subdivision annexed into the 10-mil PID. Based on the new net fee of \$923 per single-family dwelling unit to be included with the *Major Transportation Corridors Plan (MTCP)* update, the net fee for the proposed 114 lots would be \$105,222.

CONCLUSIONS/RECOMMENDATIONS

1. The site could be expected to generate about 1,085 new vehicle-trips on the average weekday with about half entering and half exiting the site during a 24-hour period. During the morning peak hour about 21 vehicles would enter and 64 vehicles would exit the site. During the afternoon peak hour about 72 vehicles would enter and 42 vehicles would exit the site.

2. The intersection of US 24/US 94/Meadowbrook is projected to operate at LOS D during the morning peak hour and LOS C during the afternoon peak hour based on both the projected 2040 background and total traffic volumes. Some of the minor movements are projected to operate at LOS E during the peak hours. The poor level of service for this movement is the result of high projected volumes on Highway 24 and Highway 94. Based on these projected high through volumes on US 24 and the high westbound left-turn volumes from Highway 94, the intersection would need to be upgraded to a grade-separated intersection in order to meet county standards for LOS regardless of this development. The PPACG 2040 plan shows the intersection of Highway 24/Marksheffel as a grade-separated interchange, but not this intersection. Funding for the future grade-separated interchange at this intersection of two state highways will be a regional improvement, which should not be the responsibility of this development. It will be the high critical movements on the state highways identified above that will eventually cause the at-grade intersection to have a LOS below county standards.
3. The intersection of Marksheffel/Meadowbrook is currently two-way stop-sign controlled. The eastbound and westbound approaches are currently operating at LOS F during the peak hours. As discussed in the Traffic Signal Warrant section above, this intersection currently meets a Four-Hour Vehicular Volume Traffic Signal Warrant. This intersection was therefore analyzed as a signalized intersection for the short-term and 2040 background and total scenarios. Based on the short-term total traffic volumes the overall intersection is projected to operate at LOS B and all movements are projected to operate at LOS D or better during the peak hours. By 2040, the eastbound left-turn and westbound through and left-turn movements are projected to operate at LOS E during the afternoon peak hour based on 2040 background and total traffic assuming both Scenario 1 and Scenario 2 development. These movements have projected delays in the LOS E range simply because they arrive at the traffic signal at the beginning of the red phase at an intersection with many phases and a long cycle length. These movements would not be considered “failing” since their volume-to-capacity ratios are less than one. The justification is that to progress through traffic along an arterial corridor, the traffic signal offsets and left-turn phase times have been adjusted to favor the through band, which can result in higher delay for the left-turn movements even though there is sufficient capacity for them.
4. The proposed east site access point to Meadowbrook Parkway is projected to operate at a satisfactory level of service as a Stop-sign-controlled intersection based on the 2020 and 2040 total traffic volumes.
5. Currently Meadowbrook Parkway extends northwest from the intersection of US 24/SH 94 for about 500 feet and then makes a 90-degree turn and continues northeast to Marksheffel Road. The site plan shows this intersection reconstructed as a three-leg intersection with this development. In the short-term this intersection should be stop-sign controlled with stop control for the north and south legs. As the parcel south of the site develops and/or a future connection is made to Peterson Road, the intersection of Meadowbrook/Meadowbrook may need to be signalized. The intersection may need to be signalized in the future (if warrants are met) with traffic generation (background traffic) by other area parcels.

6. Left-turn lanes at the site access points on Meadowbrook Parkway would be provided once Meadowbrook is striped for a center, two-way left-turn lane.
7. A westbound right-turn deceleration lane would not be required on Meadowbrook Parkway approaching either site access point.
8. All streets within this subdivision should be classified as Urban Local streets.
9. The applicant will be required to participate in the County Road Impact Fee Program. The applicant proposes to have this subdivision annexed into the 10-mil PID. Based on the new net fee of \$923 per single-family dwelling unit to be included with the *Major Transportation Corridors Plan (MTCP)* update, the net fee for the proposed 104 lots would be \$95,992.

Fax Number: (719) 633-5430

Explanation of Request (Attached diagrams, figures and other documentation to clarify request):

Section of ECM from Which Deviation is Sought: 2.3.3.F.3

Specific Criteria from Which a Deviation Is Sought: Minimum tangent length between broken back curves on a Local roadway

Proposed Nature and Extent of Deviation: The request for a deviation is to adjust the centerline tangent length between the two broken back curves on Boreal Drive (Urban Local) located at the western portion of the property from the required 200 feet to the proposed 146 feet as illustrated on the drawings.

Reason for the Requested Deviation: This area of the site contains several constraints that cannot be mitigated. These constraints include the location and width of Meadowbrook Parkway; the location of Sand Creek and its improvements; and the location of the 30-foot Sanitary Sewer Easement running parallel with the creek. All of these constraints combined narrow and limit the amount of developable area in this portion of the site. As a result, the 200-foot minimum tangent length is not achievable given the available width. The lot sizes are as small as they can be in order to remain buildable and effective. In addition, the lack of available width prevents the ability to completely line the street with units as shown on the drawings.

Comparison of Proposed Deviation to ECM Standard: The requested tangent length is 146 feet which is 54 feet less than the ECM standard of 200 feet.

Applicable Regional or National Standards used as Basis: _____

Application Consideration:

CHECK IF APPLICATION MEETS CRITERIA FOR CONSIDERATION

The ECM standard is inapplicable to a particular situation.

JUSTIFICATION

Topography, right-of-way, or other geographical conditions or impediments impose an undue hardship on the applicant, and an equivalent alternative that can accomplish the same design objective is available and does not compromise public safety or accessibility.

This area of the site contains several constraints that cannot be mitigated. These constraints include the location and width of Meadowbrook Parkway; the location of Sand Creek and its improvements; and the location of the 30-foot Sanitary Sewer Easement running parallel with the creek. All of these constraints combined narrow and limit the amount of developable area in this portion of the site. As a result, the 200-foot minimum tangent length is not achievable given the available width. The lot sizes are as small as they can be in order to remain buildable and effective. In addition, the lack of available width prevents the ability to completely line the street with units as shown on the drawings.

A change to a standard is required to address a specific design or construction problem, and if not modified, the standard will impose an undue hardship on the applicant with little or no material benefit to the public.

If at least one of the criteria listed above is not met, this application for deviation cannot be considered.

Criteria for Approval:

PLEASE EXPLAIN HOW EACH OF THE FOLLOWING CRITERIA HAVE BEEN SATISFIED BY THIS REQUEST

The request for a deviation is not based exclusively on financial considerations. The request is based on geographical constraints.

The deviation will achieve the intended result with a comparable or superior design and quality of improvement.

N/A

The deviation will not adversely affect safety or operations.

This shortened roadway tangent will not be a high traffic area nor will it become a through way as only a handful of homes are served by this looping local street. Moreover, this situation is for two 90-degree curves with 50-foot centerline radii (combined with corner knuckles) which will have design speed of about 15 mph.

This situation is vastly different from the traditional problematic "broken-back" curve issue which the ECM criteria is intended to prevent - with significantly higher design speed curves on through roadways/arterials etc. One of the reasons the typical broken-back curve situation should be avoided is because drivers do not expect to encounter such arrangement with typical highway geometry. The proposed 146-foot-long tangent length between the curves would actually exceed the stopping sight distance for a 15-mph speed (80 feet). Therefore, a motorist would not only have time to react to the adjacent curve, but could actually come to a stop before reaching the second curve. This particular situation is not uncommon or unexpected in residential neighborhoods. This deviation would not be detrimental to the health, safety, or welfare of the residents.

The deviation will not adversely affect maintenance and its associated cost.

N/A

The deviation will not adversely affect aesthetic appearance.

N/A

Owner, Applicant and Engineer Declaration:

To the best of my knowledge, the information on this application and all additional or supplemental documentation is true, factual and complete. I am fully aware that any misrepresentation of any information on this application may be grounds for denial. I have familiarized myself with the rules, regulations and procedures with respect to preparing and filling this application. I also understand that an incorrect submittal will be cause to have the project removed from the agenda of the Planning Commission, Board of County Commissioners and/or Board of Adjustment or delay review, and that any approval of this application is based on the representations made in the application and may be revoked on any breach of representation or condition(s) of approval.

Review and Recommendation:
APPROVED by the ECM Administrator

Date 17 MAY 2017

This request has been determined to have met the criteria for approval. A deviation from Section of ECM is hereby granted based on the justification provided. Comments:

Additional comments or information are attached.

DENIED by the ECM Administrator

Date _____

This request has been determined not to have met criteria for approval. A deviation from Section
of ECM is hereby denied. Comments:

Additional comments or information are attached.
