I. Introduction

Project Overview

This traffic impact study is provided as a planning document and addresses the capacity, geometric, and control requirements associated with the development entitled Space Village Filing No. 4.

This traffic impact study has been revised to address County review comments made to the March 2023 traffic impact study, regarding information on ownership and the need for clarification on recommended intersection improvements.

This proposed industrial development consists of a contractor storage yard. The development is located near the southeast corner of Space Village Avenue and Peterson Boulevard in El Paso County, Colorado.

Study Area Boundaries

The study area to be examined in this analysis encompasses the Space Village Avenue intersections with Peterson Boulevard, the eastbound U.S. Highway 24 on/off ramp, the Storage Sense access drive, and Marksheffel Road, as well as the proposed site accesses.

Figure 1 illustrates location of the site and study intersections.

Site Description

Land for the development is currently vacant and surrounded by open space and a mix of military, commercial, industrial, and residential land uses.

The proposed development is understood to entail the new construction of a contractor yard outdoor storage, on two lots totaling approximately 22.82 acres of land.

Proposed access to the development is provided via two full-movement accesses onto Space Village Avenue (referred to as Access A and Access B). It is understood that Access A will provide sole access to Lot 1 (11.23 acres) and Access B will serve Lot 2 (11.59 acres). Access A is located approximately 565 feet east of Command View and Access B is located approximately 230 feet east of Access A.

For purposes of this study, it is anticipated that development construction would be completed by end of Year 2024.

General site and access locations are shown on Figure 1.

A site plan, as prepared by Sterling Design Associates, is shown on Figure 2. This plan is provided for illustrative purposes only.

A conceptual sight distance exhibit, illustrating approximate intersection sight distance triangles, is included for reference in Appendix D. This two-dimensional exhibit does not consider the potential for landscaping or utility obstructions and was prepared in accordance to Section 2.4.2 of the Engineering Criteria Manual (ECM)¹ and Section 9.5.3.2 of the American Association of State Highway and Transportation Officials' (AASHTO) A Policy on Geometric Design of Highway and Streets (Green Book)² and is provided for illustrative purposes only.

Traffic Impact Study

SM ROCHA, LLC
Traffic and Transportation Consultants

Existing and Committed Surface Transportation Network

Within the study area, Space Village Avenue is the primary roadway that will accommodate traffic to and from the proposed development. The secondary roadways include Marksheffel Road, U.S. Highway 24, and Peterson Boulevard. A brief description of each roadway, based on the County's 2016 Major Transportation Corridors Plan (MTCP)³ and the ECM, and the City of Colorado Springs' Major Thoroughfare Plan (MTP)⁴, is provided below:

Space Village Avenue is an east-west minor arterial roadway having two through lanes (one lane in each direction) with a combination of shared and exclusive turn lanes at the intersections within the study area. Space Village Avenue provides a posted speed limit of 45 MPH.

Marksheffel Road is a north-south principal arterial roadway having four through lanes (two lanes in each direction) with exclusive turn lanes at the intersection within the study area. Marksheffel Road provides a posted speed limit of 55 MPH.

Peterson Boulevard is a north-south minor arterial roadway having four through lanes (two lanes in each direction) with a combination of shared and exclusive turn lanes at the intersection within the study area. Peterson Boulevard provides a posted speed limit of 30 MPH.

U.S. Highway 24 at Space Village Avenue is an existing interchange with U.S. Highway 24 travel north of Space Village Avenue. The interchange is within the Colorado Department of Transportation's (CDOT) jurisdiction. The eastbound on / off ramp has a posted advisory speed limit of 15 MPH. Each interchange ramp has one travel lane with exclusive turn lanes at Space Village Avenue.

The study intersection of Space Village Avenue and Peterson Boulevard is signalized. All other study intersections operate under a stop-controlled condition. A stop-controlled intersection is defined as a roadway intersection where vehicle rights-of-way are controlled by one or more "STOP" signs.

No regional or specific improvements for the above-described roadways are known to be planned or committed at this time. The study area roadways appear to be built to their ultimate cross-sections.

³ El Paso County 2016 Major Transportation Corridors Plan Update, Felsburg Holt & Ullevig, December 2016.

⁴ Major Thoroughfare Plan, City of Colorado Springs, August 2011.

II. Existing Traffic Conditions

Morning (AM) and afternoon (PM) peak hour traffic counts were collected at the Space Village Avenue intersections with Peterson Boulevard, the U.S. Highway 24 eastbound on/off ramps, Marksheffel Road, and the Storage Sense access drive. Average daily traffic (ADT) volumes were collected over a 24-hour period on Space Village Avenue. Counts were collected on Wednesday, October 26, 2022, with AM peak hour counts being collected during the period of 7:00 a.m. to 9:00 a.m. and PM peak hour counts being collected during the period of 4:00 p.m. to 6:00 p.m.

It is important to note that at the time of count collection, the east leg of the Space Village Avenue and Marksheffel Road intersection was closed. Therefore, existing traffic volumes for Space Village Avenue, east of Marksheffel Road, were obtained from the Reagan Ranch Traffic Impact Study⁵.

It is also noted that Peterson Boulevard south of Space Village Avenue provides access to the North Gate of Peterson Space Force Base. Inbound lanes for the North Gate are open from 6:00 a.m to 9:00 a.m, therefore there is little to no traffic traveling southbound on Space Village Avenue during the PM peak hour.

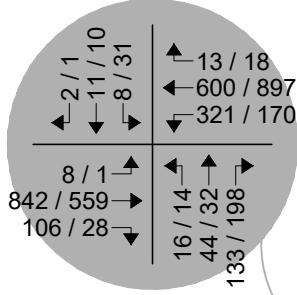

Existing volumes and intersection geometry are shown on Figure 3. Traffic count data is included for reference in Appendix A.

Existing signal timing parameters for Space Village Avenue and Peterson Boulevard were obtained from the City of Colorado Springs and used throughout this study to the best extent possible in order to remain consistent with existing signal coordination plans. City signal timing information received is included for reference in Appendix A.

Peak Hour Intersection Levels of Service – Existing Traffic

The Signalized and Unsignalized Intersection Analysis techniques, as published in the Highway Capacity Manual (HCM), 6th Edition, by the Transportation Research Board and as incorporated into the SYNCHRO computer program, were used to analyze the study intersections for existing and future traffic conditions. These nationally accepted techniques allow for the determination of intersection level of service (LOS) based on the congestion and delay of each traffic movement.

Level of service is a method of measurement used by transportation professionals to quantify a driver's perception of travel conditions that include travel time, number of stops, and total amount of stopped delay experienced on a roadway network. The HCM categorizes level of service into a range from "A" which indicates little, if any, vehicle delay, to "F" which indicates a level of operation considered unacceptable to most drivers. These levels of service grades with brief descriptions of the operating condition, for unsignalized and signalized intersections, are included for reference in Appendix B and have been used throughout this study.

The level of service analyses results for existing conditions are summarized in Table 1.

Intersection capacity worksheets developed for this study are provided in Appendix C.

Existing Traffic Analysis Results

Under existing conditions, operational analysis shows that the signalized intersection of Peterson Boulevard with Space Village Avenue has overall operations at LOS C during the morning and afternoon peak traffic hours.

The stop-controlled intersection of Space Village Avenue with the eastbound U.S. Highway 24 On/Off Ramp has turn movement operations at or better than LOS D during both peak traffic hours. Exceptions would include the southbound left turning movement which operates at LOS F during the PM peak traffic hour. The LOS F operation is attributed to the through traffic volume along Space Village Avenue and the stop-controlled nature of the intersection.

The stop-controlled intersection of Space Village Avenue with the Storage Sense Access drive has turn movement operations at LOS B or better during both peak traffic hours.

The stop-controlled intersection of Marksheffel Road with Space Village Avenue has turn movement operations at LOS C or better during the morning peak traffic hour and LOS B or better during the afternoon peak traffic hour. Exceptions include the eastbound and westbound left and through movements which operate at LOS F during both peak traffic hours. The LOS F operations are attributed to the through traffic volume along Marksheffel Road and the stop-controlled nature of the intersection.

It is to be noted that it is not uncommon for unsignalized movements to or from an arterial roadway, in urban areas, to operate with noticeable delays during peak traffic hours. It is, however, likely that turn movements will operate better than the results obtained with this HCM Two-Way Stop-Control (TWSC) level of service analysis would indicate, as the HCM analysis may not accurately account for the effect of vehicle platooning and gaps caused by upstream signals. The upstream signal control along Space Village Avenue and Marksheffel Road may tend to create additional gaps in the traffic stream for turning movements along Space Village Avenue and will likely provide mitigation to the LOS F operations projected during both peak traffic hours.

III. Future Traffic Conditions Without Proposed Development

Background traffic is the traffic projected to be on area roadways without consideration of the proposed development. Background traffic includes traffic generated by development of vacant parcels in the area.

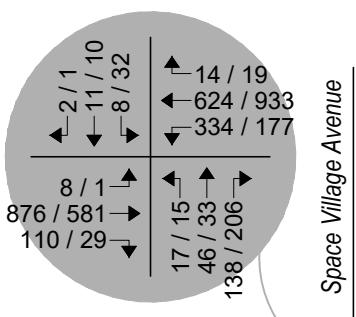

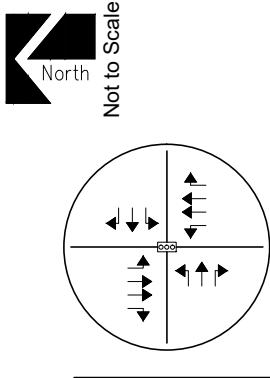

To account for projected increases in background traffic for Years 2024 and 2042, a compounded annual growth rate was determined using historical traffic data for the surrounding area provided by CDOT's Online Transportation Information System (OTIS), which anticipates a 20-year growth rate between one and two percent. Therefore, in order to provide for a conservative analysis, a growth rate of two percent was applied to existing traffic volumes. This annual growth rate provides for a conservative analysis and is assumed to account for regional growth projections and the level of in-fill development expected within the area.

Pursuant to the non-committed area roadway improvements discussed in Section I, Year 2024 and Year 2042 background traffic conditions assume no roadway improvements to accommodate regional transportation demands. This assumption provides for a conservative analysis. In order to remain consistent with the Reagan Ranch Traffic Impact Study, Year 2024 and Year 2042 background traffic conditions assume the signalization of the Space Village Avenue and Marksheffel Road intersection. Year 2042 assumes existing signal timing parameters for Space Village Avenue and Peterson Boulevard with optimized intersection splits in effort to better long-term intersection performance.

Projected background traffic volumes and intersection geometry for Years 2024 and 2042 are shown on Figure 4 and Figure 5, respectively.

Peak Hour Intersection Levels of Service – Background Traffic

As with existing traffic conditions, the operations of study intersections were analyzed under background conditions, without the proposed development, using the SYNCHRO computer program.

Background traffic level of service analysis results for Year 2024 are listed in Table 2. Year 2042 operational results are summarized in Table 3.

Definitions of levels of service are given in Appendix B. Intersection capacity worksheets are provided in Appendix C.

Background Traffic Analysis Results – Year 2024

Year 2024 background traffic analysis indicates that the signalized intersection of Peterson Boulevard with Space Village Avenue has overall operations at LOS C during the morning and afternoon peak traffic hours.

The signalized intersection of Marksheffel Road and Space Village Avenue projects overall operations at LOS B for both peak traffic hours.

The stop-controlled intersection of Space Village Avenue with the eastbound U.S. Highway 24 On/Off Ramp projects turn movement operations at or better than LOS D during both peak traffic hours. Exceptions would include the southbound left turning movement which operates at LOS F during the PM peak traffic hour. The LOS F operation is attributed to the through traffic volume along Space Village Avenue and the stop-controlled nature of the intersection.

The stop-controlled intersection of Space Village Avenue with the Storage Sense Access drive projects turn movement operations at LOS B or better during both peak traffic hours.

Key: Signalized Intersection: Level of Service (Control Delay in sec/veh)
 Stop-Controlled Intersection: Level of Service

Background Traffic Analysis Results – Year 2042

By Year 2042 and without the proposed development, the signalized intersection of Peterson Boulevard with Space Village Avenue experiences LOS D operations during the AM peak traffic hour and LOS F operations during the PM peak traffic hour. The LOS F operation is attributed to the high volume of traffic traveling north on Peterson Boulevard and the conflicting southbound left and eastbound movements. To mitigate the anticipated LOS F operation, it is recommended adding an exclusive eastbound left turn lane and increasing the southbound left signal phase timing.

The signalized intersection of Marksheffel Road and Space Village Avenue projects overall operations at LOS C for the morning peak traffic hour and LOS B for the afternoon peak traffic hour.

The stop-controlled intersection of Space Village Avenue with the eastbound U.S. Highway 24 On/Off Ramp projects turn movement operations at or better than LOS B during both peak traffic hours. Exceptions would include the northbound and southbound turning movements which operate at LOS E and LOS F during their respective peak traffic hour. The LOS E and F operations are attributed to the through traffic volume along Space Village Avenue and the stop-controlled nature of the intersection.

The stop-controlled intersection of Space Village Avenue with the Storage Sense Access drive projects turn movement operations at LOS B or better during both peak traffic hours.

It is again noted that it is not uncommon for unsignalized movements to or from an arterial roadway, in urban areas, to operate with noticeable delays during peak traffic hours. It is, however, likely that turn movements will operate better than the results obtained with this HCM Two-Way Stop-Control (TWSC) level of service analysis would indicate, as the HCM analysis may not accurately account for the effect of vehicle platooning and gaps caused by upstream signals. The upstream signal control along Space Village Avenue may tend to create additional gaps in the traffic stream for turning movements at the eastbound U.S. Highway 24 On/Off Ramp and will likely provide mitigation to the LOS F operation projected during both peak traffic hours.

IV. Proposed Project Traffic

Trip Generation

Standard traffic generation characteristics compiled by the Institute of Transportation Engineers (ITE) in their report entitled Trip Generation Manual, 11th Edition, were considered for the proposed land use in order to estimate the average daily traffic (ADT) and peak hour vehicle trips. A vehicle trip is defined as a one-way vehicle movement from point of origin to point of destination.

However, ITE's Trip Generation Manual does not provide traffic generation information for this particular land use. As such, trip generation data was gathered from previous studies for similar land use projects^{6, 7, 8} and used to estimate average daily and weekday peak hour trip information.

Table 4 presents trip generation rates from the referenced studies.

Table 4 – Trip Generation Rates

ITE CODE	LAND USE	UNIT	TRIP GENERATION RATES						
			24 HOUR	AM PEAK HOUR			PM PEAK HOUR		
				ENTER	EXIT	TOTAL	ENTER	EXIT	TOTAL
<u>Count Data Research</u>

Key: ACRE = Acres.

Note: All data and calculations above are subject to being rounded to nearest value.

⁶ SH 141 & Springfield Road Transportation Impact Study, McDowell Engineering, LLC, January 2019.

⁷ Small Contractors Yard Land Use Application, US Hwy 6 and County Road 240 (Bruce Road), Timberline Energy Inc., November 2013.

⁸ Ute Creek Industrial Storage Facility Expansion Traffic Impact Assessment, TDA Colorado, Inc., November 2010.

Upon build-out, Table 5 illustrates that the proposed development has the potential to generate approximately 309 daily vehicle trips with 45 of those occurring during the morning peak hour and 32 during the afternoon peak hour.

Adjustments to Trip Generation Rates

A development of this type is not likely to attract trips from within area land uses nor pass-by or diverted link trips from the adjacent roadway system, therefore no trip reduction was taken in this analysis.

Trip Distribution

The overall directional distribution of site-generated traffic was determined based on the location of the development site within the County, proposed and existing area land uses, allowed turning movements, available road network, and in reference to historical traffic count data provided by CDOT's Traffic Count Database System (TCDS)⁹.

Overall trip distribution patterns for the development are shown on Figure 6.

Trip Assignment

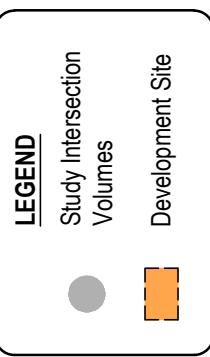

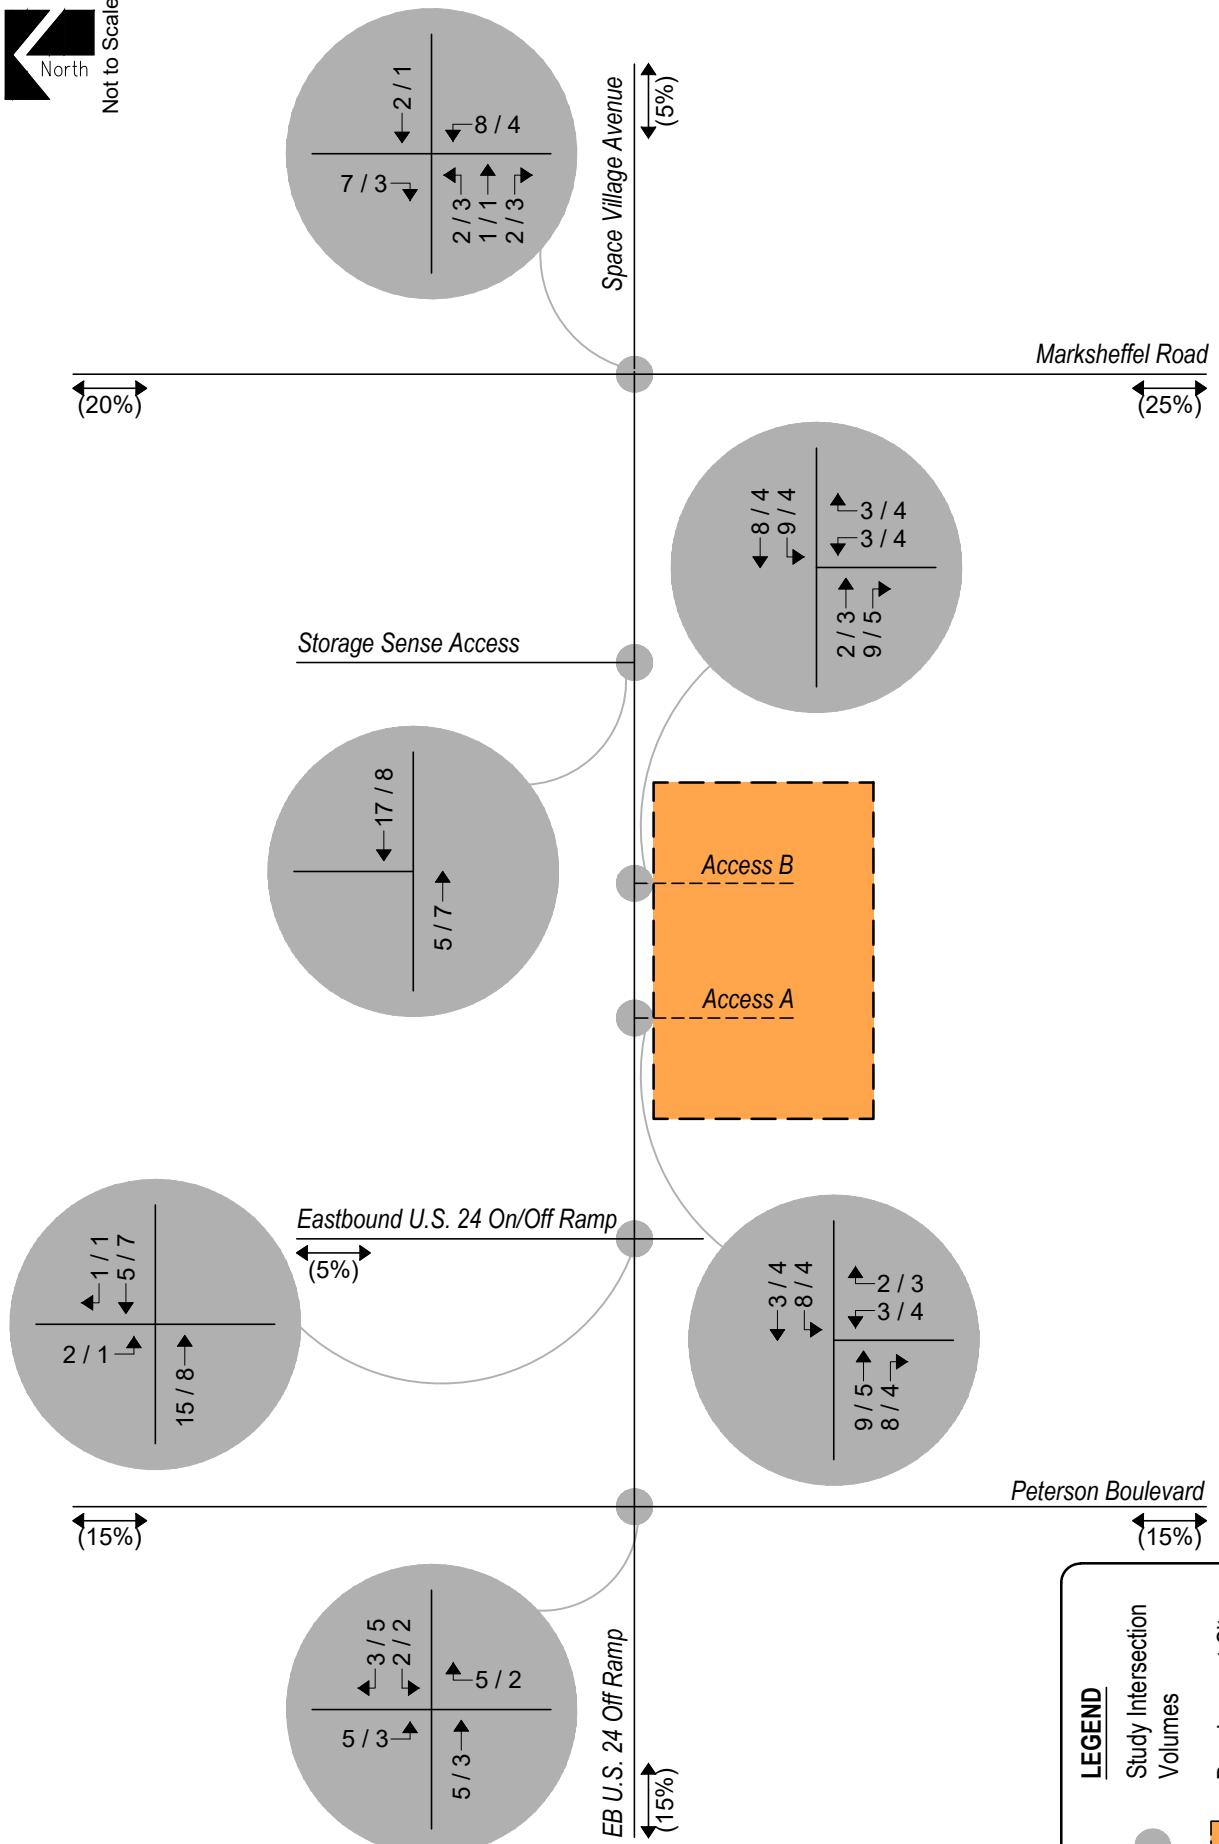

Traffic assignment is how generated and distributed vehicle trips are expected to be loaded onto the available roadway network.

Applying trip distribution patterns to site-generated traffic provides the overall site-generated trip assignments shown on Figure 6.

V. Future Traffic Conditions With Proposed Developments

Total traffic is the traffic projected to be on area roadways with consideration of the proposed development. Total traffic includes background traffic projections for Years 2024 and 2042 with consideration of site-generated traffic. For analysis purposes, it was assumed that development construction would be completed by end of Year 2024.

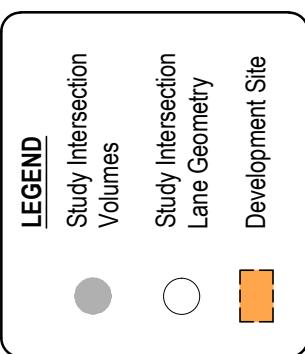

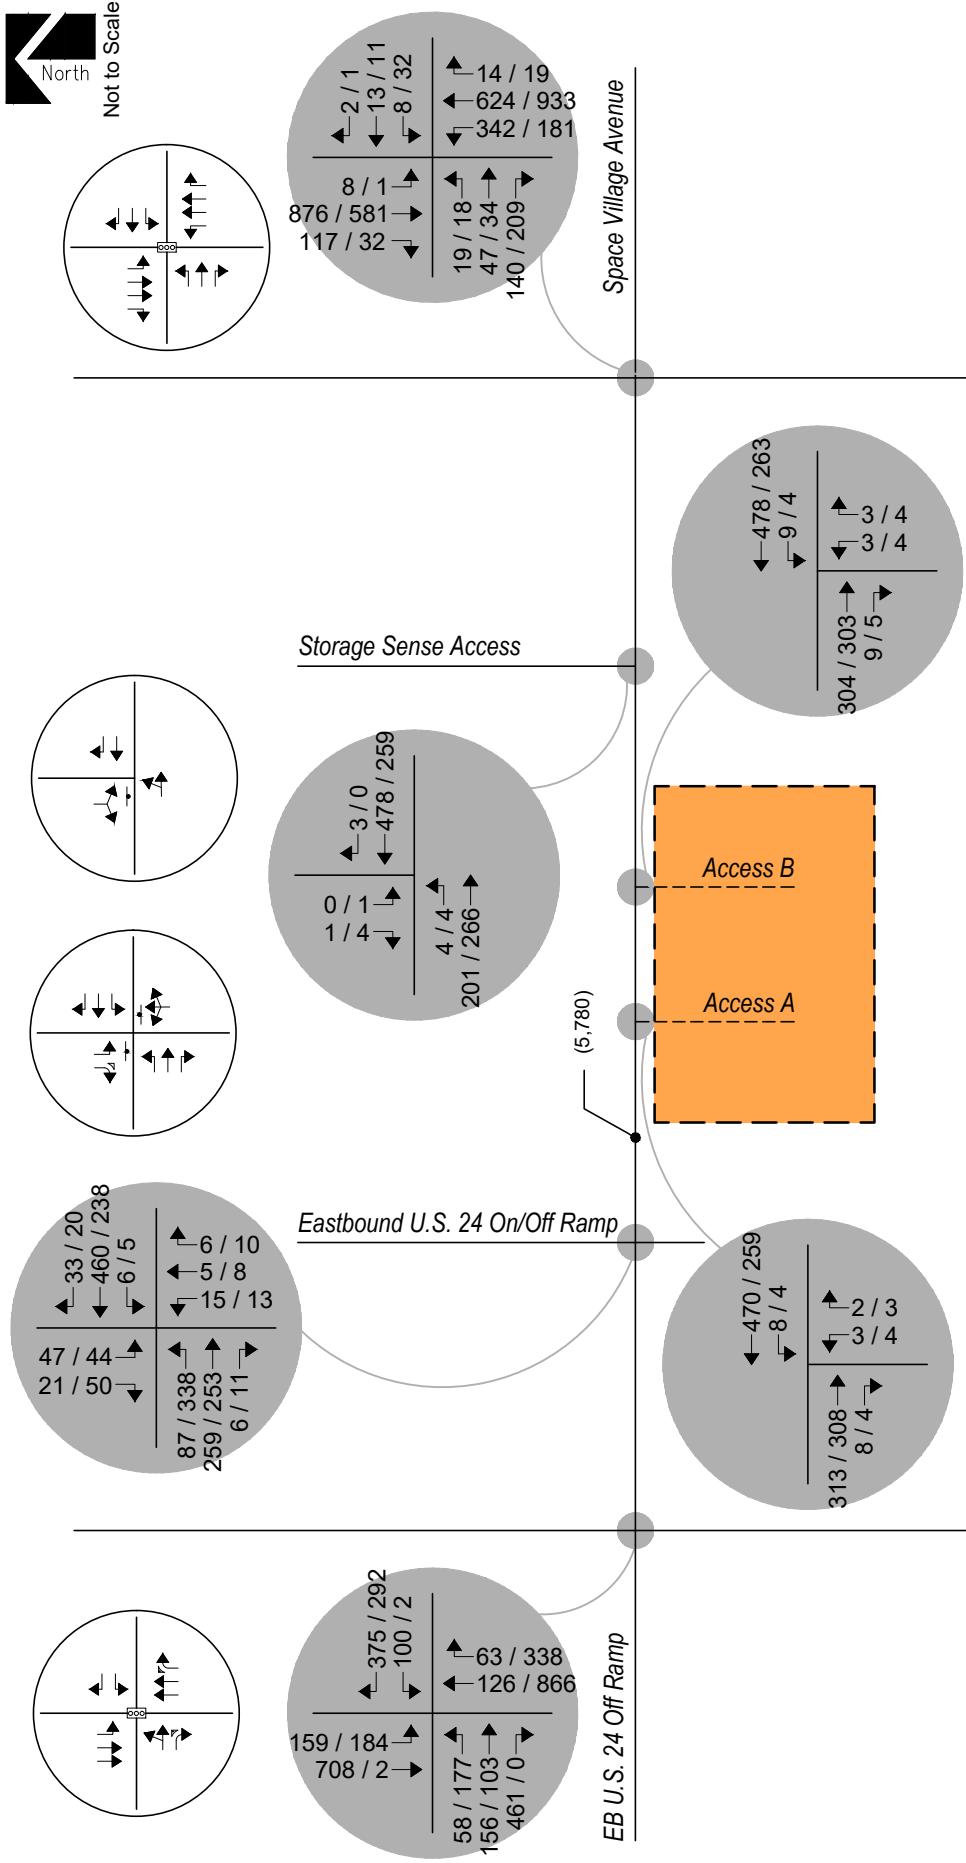

Pursuant to area roadway improvement discussions provided in Section III, Year 2024 and Year 2042 total traffic conditions assume no roadway improvements to accommodate regional transportation demands. Roadway improvements associated with site development are expected to be limited to site access and frontage as required by the governing agency.

Projected Year 2024 total traffic volumes and intersection geometry are shown in Figure 7.

Figure 8 shows projected total traffic volumes and intersection geometry for Year 2042.

VI. Project Impacts

The analyses and procedures described in this study were performed in accordance with the latest HCM and are based upon the worst-case conditions that occur during a typical weekday upon build-out of site development and analyzed land uses. Therefore, study intersections are likely to operate with traffic conditions better than those described within this study, which represent the peak hours of weekday operations only.

Total Traffic Auxiliary Lane Analysis

Auxiliary lanes for site development accesses were based on the County's ECM.

Considering development build-out, an evaluation of auxiliary lane requirements, pursuant to Section 2.3.7.D of the County's ECM, reveals that this development does not warrant the need for right or left turn deceleration lanes along Space Village Avenue since ingress traffic volumes do not exceed design hourly volume thresholds. The County's ECM states that for a minor arterial roadway, a left turn deceleration lane is required if the development's projected peak hour ingress volume exceeds 25 vehicles, and a right turn deceleration lane is required if the ingress volume exceeds 50 vehicles. The largest projected peak hour ingress volume at either site access is nine vehicles, therefore no new turn lanes are required along Space Village Avenue.

Peak Hour Intersection Levels of Service – Total Traffic

As with background traffic, the operations of the study intersections were analyzed under projected total traffic conditions using the SYNCHRO computer program. Total traffic level of service analysis results for Years 2024 and 2042 are summarized in Table 6 and Table 7, respectively.

Definitions of levels of service are given in Appendix B. Intersection capacity worksheets are provided in Appendix C.

Total Traffic Analysis Results Upon Development Build-Out

Table 7 illustrates how, by Year 2042 and upon development build-out, the signalized intersection of Peterson Boulevard with Space Village Avenue experiences LOS C operations during the AM peak traffic hour and LOS F operations during the PM peak traffic hour. The LOS F operation is attributed to the high volume of traffic traveling north on Peterson Boulevard and the conflicting southbound left and eastbound movements. To mitigate the anticipated LOS F operation, it is recommended adding an exclusive eastbound left turn lane and increasing the southbound left signal phase timing.

The signalized intersection of Marksheffel Road and Space Village Avenue projects overall operations at LOS C for the morning peak traffic hour and LOS B for the afternoon peak traffic hour.

The stop-controlled intersection of Space Village Avenue with the eastbound U.S. Highway 24 On/Off Ramp projects turn movement operations at or better than LOS B during both peak traffic hours. Exceptions still include the northbound and southbound turning movements which operate at LOS E and LOS F during their respective peak traffic hour. The LOS E and F operations are attributed to the through traffic volume along Space Village Avenue and the stop-controlled nature of the intersection.

The stop-controlled intersection of Space Village Avenue with the Storage Sense Access drive projects turn movement operations at LOS B or better during both peak traffic hours.

The stop-controlled intersections of Access A and Access B with Space Village Avenue project turn movement operations at LOS C or better during the morning peak traffic hour and LOS B or better during the afternoon peak traffic hour.

It is again noted that it is not uncommon for unsignalized movements to or from an arterial roadway, in urban areas, to operate with noticeable delays during peak traffic hours. It is, however, likely that turn movements will operate better than the results obtained with this HCM Two-Way Stop-Control (TWSC) level of service analysis would indicate, as the HCM analysis may not accurately account for the effect of vehicle platooning and gaps caused by upstream signals. The upstream signal control along Space Village Avenue may tend to create additional gaps in the traffic stream for turning movements at the eastbound U.S. Highway 24 On/Off Ramp and will likely provide mitigation to the LOS F operation projected during both peak traffic hours.

Compared to the background traffic analysis, the traffic generated by the proposed development is not expected to significantly change the operations of the study intersection. These intersection operations are similar to background conditions.

Pedestrian Circulation & Safety Analysis

In accordance with Section B.2.4.B of the County's ECM, an assessment to pedestrian connectivity and safety was considered.

The proposed development would accommodate pedestrians and bicyclists with sidewalks along Space Village Avenue which will connect to the existing pedestrian network.

With the assumption that future site plans are designed per the County's ECM, and pursuant to the Federal Highway Administration's (FHWA) Guide for Improving Pedestrian Safety at Uncontrolled Crossing Locations¹⁰, pedestrian safety is not expected to be of concern. Moreover, traffic calming and pedestrian crossing treatments are not applicable, and traffic calming is not recommended for the proposed conditions.

¹⁰ Guide for Improving Pedestrian Safety at Uncontrolled Crossing Locations, Federal Highway Administration, July 2018.

VII. Conclusion

This traffic impact study addressed the capacity, geometric, and control requirements associated with the development entitled Space Village Filing No. 4. This proposed industrial development consists of a contractor storage yard. The development is located near the southeast corner of Space Village Avenue and Peterson Boulevard in El Paso County, Colorado.

The study area examined in this analysis encompassed the Space Village Avenue intersections with Peterson Boulevard, the eastbound U.S. Highway 24 on/off ramp, the Storage Sense access drive, and Marksheffel Road as well as the proposed site accesses.

Analysis was conducted for critical AM Peak Hour and PM Peak Hour traffic operations for existing traffic conditions, Year 2024 and Year 2042 background traffic conditions, and Year 2024 and Year 2042 total traffic conditions.

Analysis of existing traffic conditions indicates that the signalized intersection of Peterson Boulevard with Space Village Avenue has overall operations at LOS C during the morning and afternoon peak traffic hours. The stop-controlled intersection of Space Village Avenue with the eastbound U.S. Highway 24 On/Off Ramp has turn movement operations at or better than LOS D during both peak traffic hours. Exceptions would include the southbound left turning movement which operates at LOS F during the PM peak traffic hour. The stop-controlled intersection of Space Village Avenue with the Storage Sense Access drive has turn movement operations at LOS B or better during both peak traffic hours. The stop-controlled intersection of Marksheffel Road with Space Village Avenue has turn movement operations at LOS C or better during the morning peak traffic hour and LOS B or better during the afternoon peak traffic hour. Exceptions include the eastbound and westbound left and through movements which operate at LOS F during both peak traffic hours.

Without the proposed development, Year 2024 background operational analysis shows that the signalized intersection of Peterson Boulevard with Space Village Avenue has overall operations at LOS C during the morning and afternoon peak traffic hours. The signalized intersection of Marksheffel Road and Space Village Avenue projects overall operations at LOS B for both peak traffic hours. The stop-controlled intersection of Space Village Avenue with the eastbound U.S. Highway 24 On/Off Ramp projects turn movement operations at or better than LOS D during both peak traffic hours. Exceptions still include the southbound left turning movement which operates at LOS F during the PM peak traffic hour. The stop-controlled intersection of Space Village Avenue with the Storage Sense Access drive projects turn movement operations at LOS B or better during both peak traffic hours.

By Year 2042 and without the proposed development, the signalized intersection of Peterson Boulevard with Space Village Avenue experiences LOS D operations during the AM peak traffic hour and LOS F operations during the PM peak traffic hour. The signalized intersection of Marksheffel Road and Space Village Avenue projects overall operations at LOS C for the morning peak traffic hour and LOS B for the afternoon peak traffic hour. The stop-controlled intersection of Space Village Avenue with the eastbound U.S. Highway 24 On/Off Ramp projects turn movement operations at or better than LOS B during both peak traffic hours. Exceptions would include the northbound and southbound turning movements which operate at LOS E and LOS F during their respective peak traffic hour. The stop-controlled intersection of Space Village Avenue with the Storage Sense Access drive projects turn movement operations at LOS B or better during both peak traffic hours.

Analysis of future traffic conditions indicates that the addition of site-generated traffic is expected to create no negative impact to traffic operations for the existing and surrounding roadway system upon roadway and intersection control improvements assumed within this analysis. With all conservative assumptions defined in this analysis, the study intersections are projected to operate at future levels of service comparable to Year 2042 background traffic conditions. Proposed site accesses have long-term operations at LOS C or better during peak traffic periods and upon build-out.

This site is subject to the El Paso County Road Impact Fee Program (Resolution 19-471), as amended. An option for payment will be selected at the final land use approval stage.

APPENDIX A

Traffic Count Data

Signal Timing Information

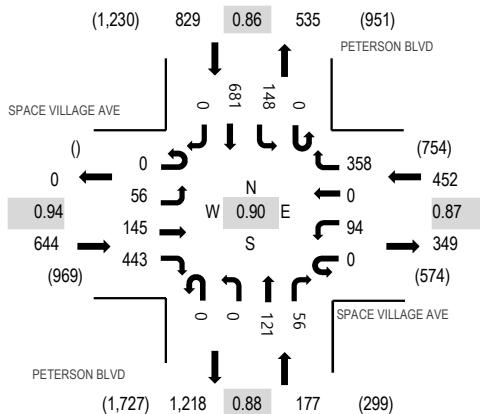

Location: 1 PETERSON BLVD & SPACE VILLAGE AVE AM

Date: Wednesday, October 26, 2022

APPENDIX B

Level of Service Definitions

The following information can be found in the [Highway Capacity Manual](#), Transportation Research Board, 2016:
Chapter 19 – Signalized Intersections and Chapter 20 – Two-Way Stop Controlled Intersections.

Automobile Level of Service (LOS) for Signalized Intersections

Levels of service are defined to represent reasonable ranges in control delay.

LOS A

Describes operations with a control delay of 10 s/veh or less and a volume-to-capacity ratio no greater than 1.0. This level is typically assigned when the volume-to-capacity ratio is low and either progression is exceptionally favorable or the cycle length is very short. If it is due to favorable progression, most vehicles arrive during the green indication and travel through the intersection without stopping.

LOS B

Describes operations with control delay between 10 and 20 s/veh and a volume-to-capacity ratio no greater than 1.0. This level is typically assigned when the volume-to-capacity ratio is low and either progression is highly favorable or the cycle length is short. More vehicles stop than with LOS A.

LOS C

Describes operations with control delay between 20 and 35 s/veh and a volume-to-capacity ratio no greater than 1.0. This level is typically assigned when progression is favorable or the cycle length is moderate. Individual *cycle failures* (i.e., one or more queued vehicles are not able to depart as a result of insufficient capacity during the cycle) may begin to appear at this level. The number of vehicles stopping is significant, although many vehicles still pass through the intersection without stopping.

LOS D

Describes operations with control delay between 35 and 55 s/veh and a volume-to-capacity ratio no greater than 1.0. This level is typically assigned when the volume-to-capacity ratio is high and either progression is ineffective or the cycle length is long. Many vehicles stop and individual cycle failures are noticeable.

LOS E

Describes operations with control delay between 55 and 80 s/veh and a volume-to-capacity ratio no greater than 1.0. This level is typically assigned when the volume-to-capacity ratio is high, progression is unfavorable, and the cycle length is long. Individual cycle failures are frequent.

LOS F

Describes operations with control delay exceeding 80 s/veh or a volume-to-capacity ratio greater than 1.0. This level is typically assigned when the volume-to-capacity ratio is very high, progression is very poor, and the cycle length is long. Most cycles fail to clear the queue.

Level of Service (LOS) for Unsignalized TWSC Intersections

Level of Service ($v/c \leq 1.0$)	Average Control Delay (s/veh)
A	0 - 10
B	> 10 - 15
C	> 15 - 25
D	> 25 - 35
E	> 35 - 50
F	> 50

Offset: 1 (1%), Referenced to phase 2:NBT and 6:SBTL, Start of Green												
Natural Cycle: 150												
Control Type: Actuated-Coordinated												

Timings

Total Traffic Conditions

1: Peterson Boulevard & EB Highway 24 Off Ramp/Space Village Avenue

PM Peak Hour - Year 2042

Maximum v/c Ratio: 1.18

Intersection Signal Delay: 87.2

Intersection LOS: F

Intersection Capacity Utilization 97.3%

ICU Level of Service F

Analysis Period (min) 15

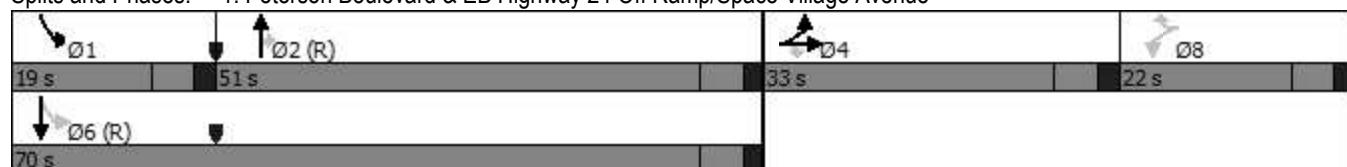

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Splits and Phases: 1: Peterson Boulevard & EB Highway 24 Off Ramp/Space Village Avenue
