Re: D. Johnson Subdivision

Dear Mr. Green,

Colorado Parks and Wildlife (CPW) has reviewed the development plans for the D. Johnson Subdivision. CPW is familiar with the project site located .64 miles north of the intersection of Highway 83 and Old North Gate Rd. on the west side of Highway 83 in Colorado Springs, CO. CPW staff has visited the site and offers the following comments for your consideration.

CPW is concerned that many trees could be removed during the development process. The concern lies in the fact that trees may be currently occupied or be historic bird nesting sites. Please take care to avoid removal of trees with visible nests within the canopy. We recommend leaving as many native healthy trees on site and replacing trees that are removed with comparable native species on a 3:1 basis. Dead trees, or snags, provide valuable perching areas for native birds or nesting opportunities for cavity nesting species. Snags should be left standing where possible.

Fences can cause many problems for wildlife, including death, entanglements, and barriers to movements. CPW recommends the developers consult our publication "Fencing with Wildlife in mind." (cpw.state.co.us. *Hanophy 2009*) when considering the design of fences within the development. The publication is available on our website and we would be happy to provide a link to the PDF specifically. The use of privacy fencing, chain link fencing, and other exclusionary fencing should be at least 6 feet high and should be restricted to the immediate area surrounding the buildings or within the designated building envelope and should not be used as a method to designate boundaries of larger lot sizes (> 1 acre). Fencing outside the immediate building envelope or area surrounding the buildings on larger lots within the known range of elk, deer and pronghorn should be a maximum top height of 42" with at least 12" spacing between the top two wires or rails and a bottom wire or rail at least 16" above the ground to allow passage of juvenile animals and pronghorn antelope. It is also recommended that the top and bottom wires be a twisted barbless construction. Ornamental wrought iron fencing with close vertical bars (<12") and sharp projections extending beyond the top horizontal bar should be strongly discouraged. This fencing typically ensnares deer and elk by the hips when trying to squeeze through and impales animals attempting to go over the top.

Black bears are common along the Front Range, and this subdivision will potentially have bears coming into and around the area. CPW recommends several measures to reduce the potential for human bear conflicts. First, we strongly recommend that home owners are advised to purchase bear-resistant trash containers, and that potential home owners are advised that bears will be present in the area. Trash containers should be stored in the garage or in a solid locked storage shed until the morning of trash collection during those months when bears are most active (April - November). Second, residents should also keep their barbecues and any food locked away in the garage or a secure building. Finally, we would recommend that the use of bird feeders and hummingbird feeders be discouraged, during the months mentioned above, since they also attract black bears. However, if feeders are used, they should be placed so they are inaccessible to black bears, raccoons, skunks, deer and other wildlife species that might cause damage or threaten human safety. A copy of a brochure entitled, "Living with wildlife in bear country" is available for reference upon request from CPW. Bears that become habituated to people and human foods ultimately have to be euthanized. Proper education and trash storage reduces the number of these "problem" bears.

Feeding of all wildlife should be prohibited, with the exception of songbirds and with the above paragraph in mind. It is illegal to feed big game including deer, elk, antelope, bear and mountain lion. CPW would recommend that home buyers are provided with educational material regarding wildlife either through the purchase process, or through the development itself. There is a sizeable resident deer herd near this subdivision. It is illegal to provide feed for deer because of health and safety concerns both for humans and the deer. Concentrations of deer will attract predators, including mountain lions. Dangerous conflicts with mountain lions are rare, however care should be used when living in mountain lion habitat. CPW also warns that feeding and habituating deer may lead to harmful and dangerous interactions with these deer.

CPW recommends that a Noxious Weed Management Plan be followed closely during the development of the properties. All disturbed soils should be monitored for noxious weeds and noxious weeds should be actively controlled until native plant revegetation and reclamation is achieved. All areas disturbed by the development should be revegetated with native plant species.

CPW appreciates being given the opportunity to comment on this development project. Please feel free to contact Wildlife Officer Corey Adler at 719-439-9637 or corey.adler@state.co.us should you have any questions or require additional information.

Sincerely,

Frank McGee
Area Wildlife Manager
