

TECHNICAL MEMORANDUM

DATE: October 2, 2018

TO: PT McCune, LLC

FROM: Ecosystem Services, LLC

RE: DRAFT Wildland Fire & Hazard Mitigation Plan for the Winsome Project
in El Paso County, Colorado (PCD File No. SP-18-006)

1.0 Introduction

Ecosystem Services, LLC (Ecos or ecos) was retained by PT McCune, LLC (Applicant) to perform a natural resource assessment for the approximate 765-acre Winsome Project site (Site) and to prepare this DRAFT Wildland Fire & Hazard Mitigation Plan (Draft Plan).

1.1 Purpose

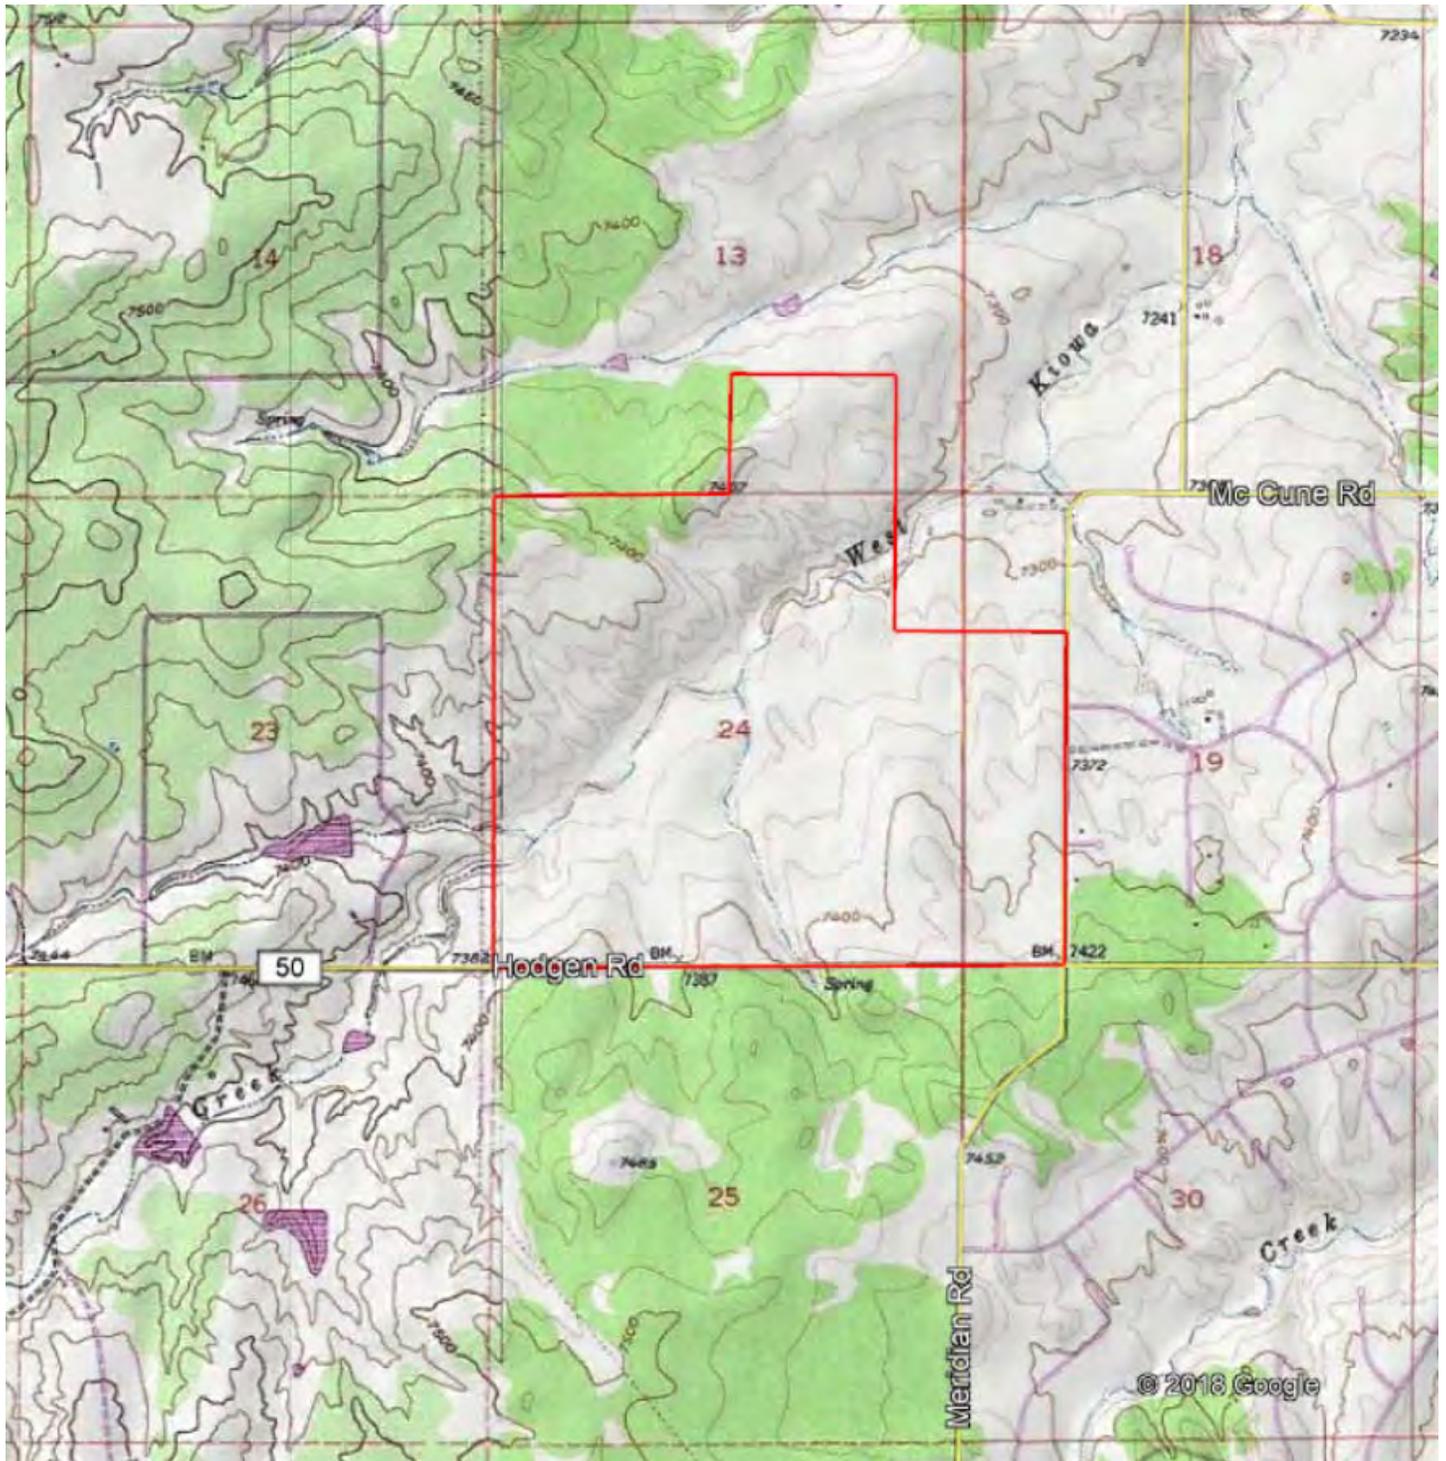

The stated purpose and intent of the “2018 El Paso County Development Standards” for “Fire Protection and Wildfire Mitigation” is to ensure that proposed development is reviewed for wildfire risks and adequate fire protection. No permit or approval associated with development, construction or occupancy shall be approved or issued until the provisions of these standards are satisfied. This Draft Plan generally meets the requirements for a Fire Protection Report per County Code.

Ecos has provided an additional reference to assist the residents of the Site in meeting both County and State requirements by appending the Community Wildfire Protection Plan for Unincorporated El Paso County “A Continuing Process” (El Paso County Sheriff’s Office Emergency Services Division, 2010) to this Plan (Appendix C).

1.2 Project Description and Site Location

The Applicant proposes to form a metropolitan district within El Paso County and develop the 765-acre Site as a residential community consisting of 5-acre and 2.5 acre single-family detached rural-residential lots and one commercial lot, including trails, utilities, and streets and cul-de-sacs that provide access to each lot; and preserve 148.6 acres of open space along West Kiowa Creek.

The Site is located in the northeastern corner of the Black Forest approximately 12.5 miles east of Monument and 7.3 miles east of Highway 83, in El Paso County, Colorado. The Site is located in the northwest corner of Hodgen and Meridian Roads. The Site is specifically located within Section 24, the south ¼ of Section 13, and the west ½ of Section 19, Township 11 South, Range 65 West in El Paso County, Colorado (refer to Figures 1 and 2).

USGS 7.5 min. Quad: Eastonville
Latitude: 39.078344°N
Longitude: -104.614832°W
Section 24, Township 11 South, Range 65 West

2.0 Environmental Setting

A review of the El Paso County Master Plan revealed that the Site is located within the Black Forest Preservation Area.

2.1 Topography

The Site is generally characterized by rolling hills and valleys with some deep ravines draining to the West Kiowa Creek (Creek). The topography of the Site trends gently downward from the southwest to the northeast with north facing and south facing slopes tilting toward the Creek. Topography ranges from high elevations of 7448 feet above mean sea level (AMSL) in the northwestern corner and 7426 feet in the southeast corner to 7276 feet where the Creek exits the site on the east boundary, a total elevation drop of 172 feet. The Creek enters the site at the west boundary at an elevation of 7336 and drops 60 feet before flowing off of the Site. Naturally undulating and intermittent drainage swales drain toward the Creek that contain wetlands in low areas and dry areas where alluvial deposits have formed.

2.2 Soils

Ecos utilized the U.S. Department of Agriculture, Natural Resource Conservation Service Web Soil Survey (USDA, NRCS, 2018) to determine soils types within the Site and to supplement the field observations of vegetation, as the USDA provides correlation of native vegetation species by soils types. Please refer to Figure 3, NRCS Soil Map.

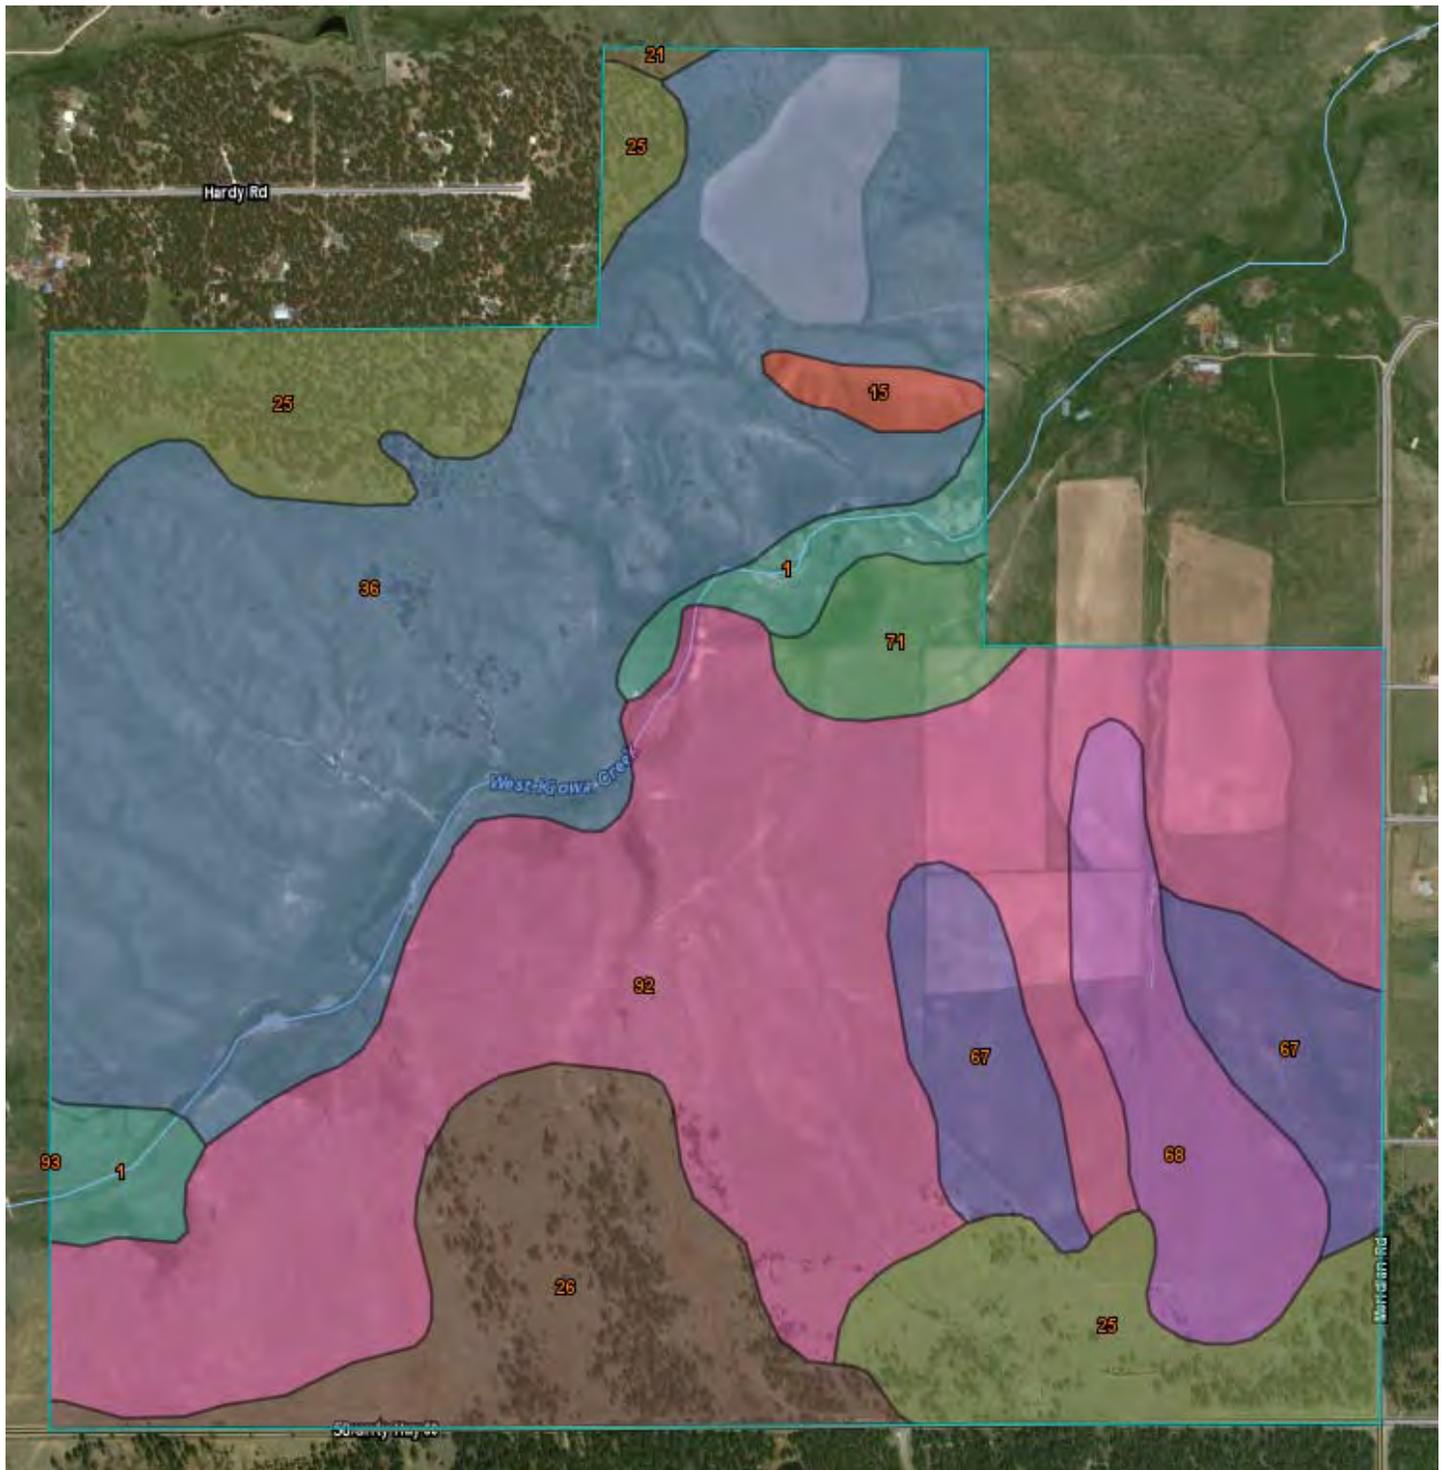

Additional, detailed soil data for the Project are presented in the Soils & Geology Report that will be included in the Project submittal to El Paso County.

3.3 Vegetation

The Black Forest region includes a mix of ponderosa pine (*Pinus ponderosa*) woodlands and native grassland. In addition to shortgrass prairie, there are also relict eastern American prairie and woodland plant communities with species otherwise unknown in Colorado except for some protected canyons in the outer Front Range (Weber, 2012). Well-developed riparian communities occur along drainages that support plains cottonwood (*Populus deltoides*), narrowleaf cottonwood (*Populus angustifolia*), crack willow (*Salix fragilis*) and sandbar willow (*Salix exigua*), sedges, rushes and grasses. The area has historically been used for rangeland; however, residential development is increasing.

3.3.1 Ponderosa Pine Forest

Ponderosa pine forest on Site is present along the southern edge and in the northwest corner. There are also ponderosa pine patches and individual trees scattered throughout the shortgrass prairie. Most of the forest areas have been heavily grazed, but still have a relatively diverse herbaceous understory. Mountain muhly (*Muhlenbergia montana*) is the most common grass species. Other grass species include junegrass (*Koeleria macrantha*), Canada wild rye (*Elymus canadensis*), and squirreltail (*E. elymoides*). Forbs include wild tarragon (*Oligosporus (Artemisia) dracunculus*), yarrow (*Achilla lanulosa*), harebell (*Campanula rotundifolia*), and Fendler's sandwort (*Arenaria fendleri*). Yellow toadflax, a noxious weed, is common in the forested areas in the northwest corner/south of Hardy Road.

Summary by Map Unit — El Paso County Area, Colorado (CO625)

| Map unit symbol | Map unit name | Rating | Acres in AOI | Percent of AOI |
|------------------------------------|---|---|--------------|----------------|
| 1 | Alamosa loam, 1 to 3 percent slopes | Alamosa loam, 1 to 3 percent slopes | 22.9 | 3.0% |
| 15 | Brussett loam, 3 to 5 percent slopes | Brussett loam, 3 to 5 percent slopes | 5.9 | 0.8% |
| 21 | Cruckton sandy loam, 1 to 9 percent slopes | Cruckton sandy loam, 1 to 9 percent slopes | 1.1 | 0.1% |
| 25 | Elbeth sandy loam, 3 to 8 percent slopes | Elbeth sandy loam, 3 to 8 percent slopes | 86.3 | 11.3% |
| 26 | Elbeth sandy loam, 8 to 15 percent slopes | Elbeth sandy loam, 8 to 15 percent slopes | 67.3 | 8.8% |
| 36 | Holderness loam, 8 to 15 percent slopes | Holderness loam, 8 to 15 percent slopes | 250.4 | 32.7% |
| 67 | Peyton sandy loam, 5 to 9 percent slopes | Peyton sandy loam, 5 to 9 percent slopes | 45.2 | 5.9% |
| 68 | Peyton-Pring complex, 3 to 8 percent slopes | Peyton-Pring complex, 3 to 8 percent slopes | 38.3 | 5.0% |
| 71 | Pring coarse sandy loam, 3 to 8 percent slopes | Pring coarse sandy loam, 3 to 8 percent slopes | 15.0 | 2.0% |
| 92 | Tomah-Crowfoot loamy sands, 3 to 8 percent slopes | Tomah-Crowfoot loamy sands, 3 to 8 percent slopes | 233.8 | 30.5% |
| 93 | Tomah-Crowfoot complex, 8 to 15 percent slopes | Tomah-Crowfoot complex, 8 to 15 percent slopes | 0.0 | 0.0% |
| Totals for Area of Interest | | | 766.1 | 100.0% |

The ponderosa pine forest in the northernmost portion of the Site appears to have been minimally grazed and the herbaceous vegetation is much taller and denser here. Two unique plant communities are present here:

- 1) Ponderosa Pine/Sun Sedge Woodland is present in the western half of this area. This community is comprised of a dense overstory of large ponderosa pine, and the dominant understory species is sun sedge (*Carex inops* ssp. *heliophila*). Mountain muhly and smooth brome are also common.
- 2) Ponderosa Pine/Little Bluestem Woodland occurs to the east. The ponderosa pines here are smaller and sparser, with only 10 to 30% cover. The understory consists of tall, dense grasses with three dominant species: little bluestem (*Schizachyrium scoparium*), mountain muhly, and blue grama. Hairy false goldenaster (*Heterotheca villosa*) is also common.

3.3.2 Shortgrass Prairie

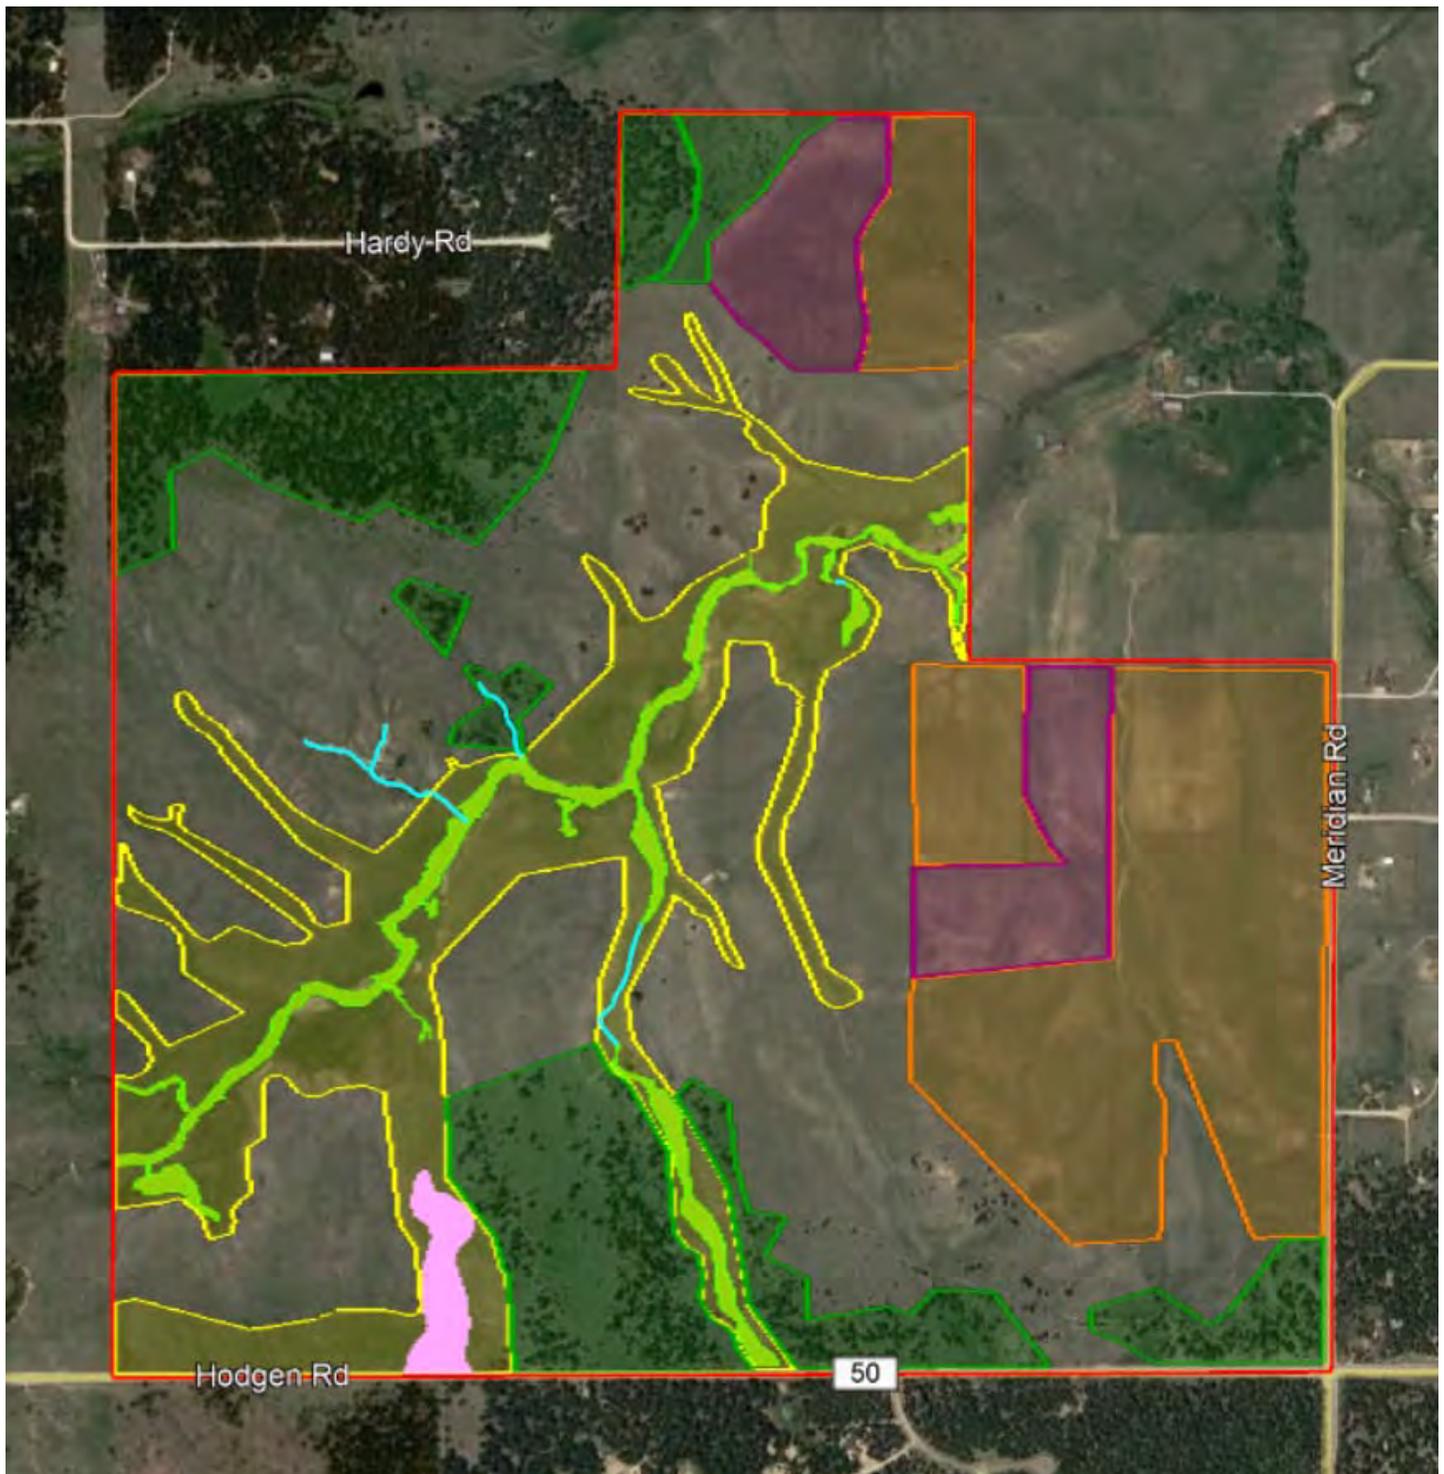

The majority of the Site is vegetated with shortgrass prairie and the dominant species in almost all of these prairie areas is blue grama (*Bouteloua gracilis*) (Figure 4). The other most common species are hairy false goldenaster and fringed sage (*Artemisia frigida*). Other species include broom snakeweed (*Gutierrezia sarothrae*), wavy-leaf thistle (*Cirsium undulatum*), and green-needle grass (*Nassella viridula*). The prairie south of the Creek is heavily grazed and there are scattered weeds throughout, primarily knapweed and common mullein. The prairie north of the Creek is on a drier, south facing slope, and this area appears to have been less impacted by grazing and weeds are limited to the lower areas.

Two subtypes of shortgrass prairie were mapped by ecos:

- 1) The moister portions of the shortgrass prairie tend to be weedy and are mapped as “**shortgrass prairie-weedy**” (Figure 4). Most of the lower areas along the Creek have dense cover of common knapweed, which extends far into the adjacent uplands, especially along drainage swales and in areas disturbed by grazing.
- 2) Based on observed vegetation and aerial photographs, the easternmost and northernmost portions of the Site appear to have been occasionally plowed in the past and therefore are mapped as “**shortgrass prairie – disturbed**” (Figure 4). Past disturbance is evidenced by the presence of introduced pasture species, including smooth brome (20-30%) with minor amounts of alfalfa and crested wheatgrass. There is also decreased cover of blue grama and increased areas of bare ground. Weeds are generally low density, but scattered throughout and include common mullein, knapweed, and pigweed (*Amaranthus retroflexus*). Native forbs tend to be weedy and include fringed sage, hairy false golden aster, wild tarragon, white prairie aster (*Symphyotrichum falcatum*), and winged buckwheat (*Eriogonum alatum*).

3.3.3 Plowed Fields

There are currently three recently plowed fields where bare ground is approximately 75%. Smooth brome (10%) is the most common species in these areas. Alfalfa (3%) was observed in the northern field. Knapweed (3%) was present in the eastern field. These three fields are all located within the areas mapped as shortgrass prairie – disturbed.

|  | Shortgrass Prairie - Disturbed | | |
|  | Shortgrass Prairie - Plowed | | |

Note: Shortgrass prairie is shown in natural color of aerial photograph.

4.0 Wildfire Hazard

The Wildfire Hazard Assessment is based on the information available at the drafting of this Draft Plan based on the current stage of development planning and design (i.e., road and lot layout plan, no landscape plan, no CCRs, and no layout plan for home or ancillary structure locations within each lot). Once design and CCRs have progressed, the information in this Draft Plan may be incorporated into a “Final Wildland Fire and Hazard Mitigation Plan” that will be updated and “tailored to the stage of development application and the stage of subdivision-related construction” (per County Code). It is expected that individual lot owners/home builders would be responsible for completing their own “Wildland Fire Risk and Hazard Severity Analysis”.

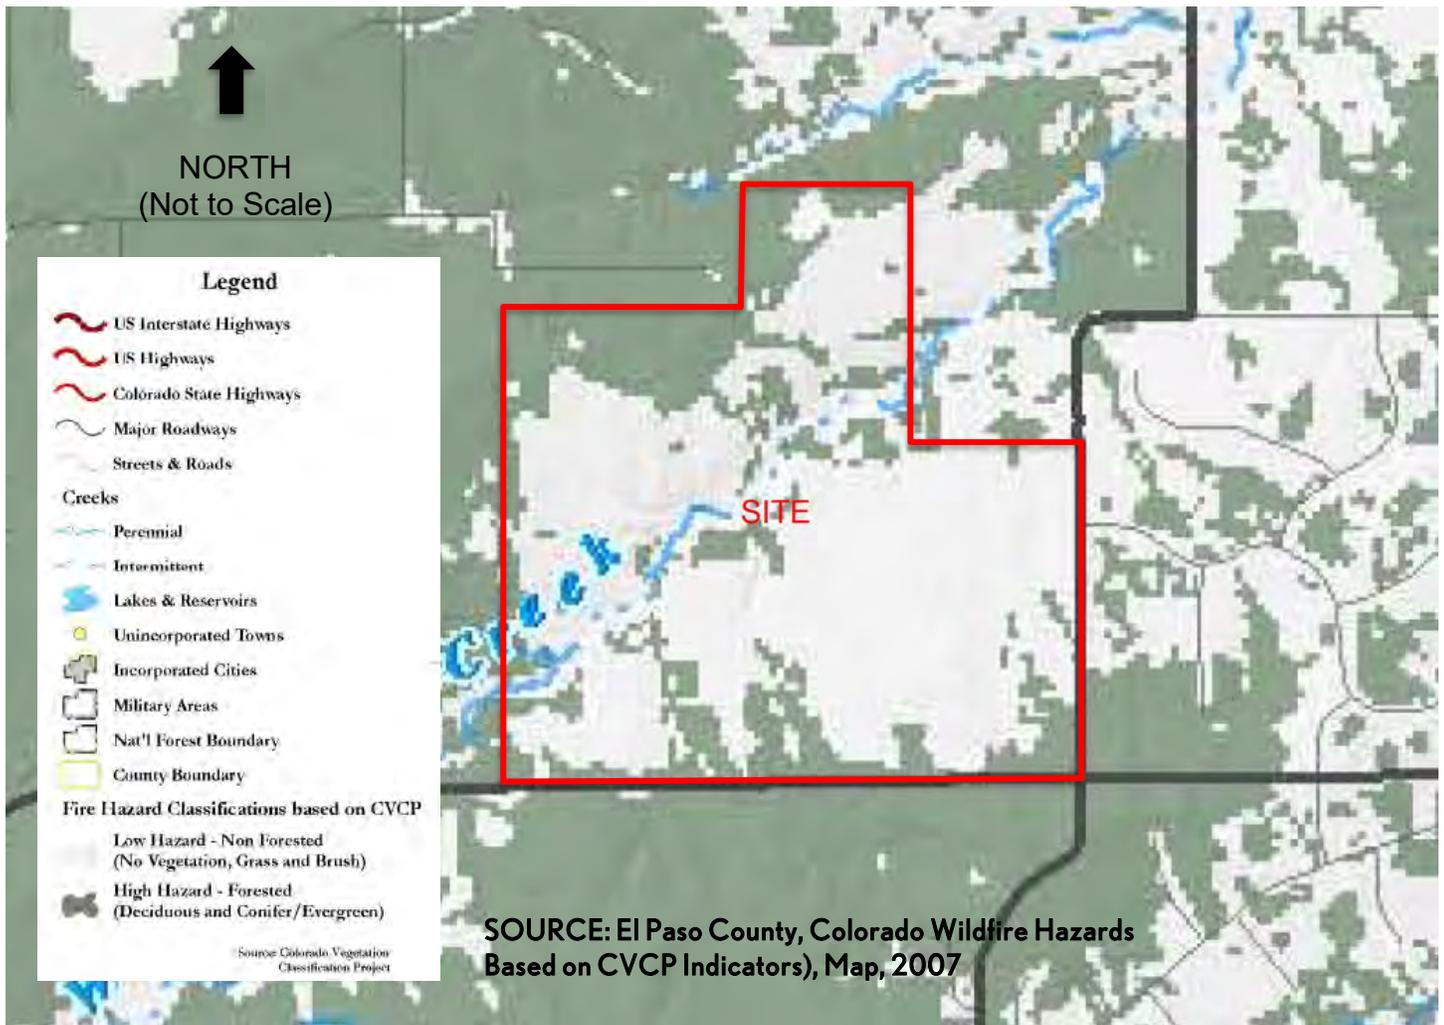

The stated purpose and intent of the 2018 El Paso County Development Standards” for “Fire Protection and Wildfire Mitigation” is to ensure that proposed development is reviewed for wildfire risks and adequate fire protection. No permit or approval associated with development, construction or occupancy shall be approved or issued until the provisions of these standards are satisfied. This Draft Plan generally meets the requirements for a Fire Protection Report per County Code.

Fire hazard was evaluated using two resources, the Colorado State Forest Service (CSFS) online Wildfire Risk Assessment Portal (WRAP) (CSFS, 2018) and the El Paso County Wildfire Hazard Map (El Paso County, 2007) (Figure 5).

The CSFS WRAP estimates potential wildfire intensity based on a 2-mile buffer and classifies potential fire intensity on most of the Site as being moderate to high.

- Moderate: Flames up to 8 feet in length; short-range spotting is possible. Trained firefighters will find these fires difficult to suppress without support from aircraft or engines, but dozer and plows are generally effective.
- High: Large Flames, up to 30 feet in length; short-range spotting common; medium range spotting possible. Direct attack by trained firefighters, engines, and dozers is generally ineffective, indirect attack may be effective.

The El Paso County Wildfire Hazard Map is based only on the existing vegetation and classifies the forested areas and scattered trees on the Site as High Hazard. Most of the Site consists of grassland areas that are classified as low wildfire hazard. [Note: the Vegetation Map required to be referenced in the current Land Development Code is not available.] “Wildland areas” include land shown as forested (high hazard) or areas identified as such in the “Wildland Fire Risk and Hazard Mitigation Plan.” Since the Site includes forested (high hazard) areas, it is subject to the wildland areas requirements. Additionally, once the “Wildland Fire and Hazard Mitigation Plan” is completed for the Project; additional areas may be identified that must comply with the wildland area requirements.

 - (5308) P. Pine/Mountain Shrub Mix
 - (5309) P. Pine/Aspen/Mesic Mountain Shrub Mix

4.1 Fire Protection

The Site is located within the jurisdiction and boundaries of the Falcon Fire Protection District (FFPD). The Falcon Fire Department (Fire Department) has provided a letter dated September 20, 2018 (Appendix A) to confirm its commitment to provide fire suppression, fire prevention, emergency rescue, ambulance, hazardous materials and emergency medical services (collectively, "Emergency Services") to the property, subject to the following conditions:

- All new construction, renovations or developments within the Fire Department's jurisdiction must comply with the applicable fire code and nationally recognized life-safety standards adopted by the El Paso County Board of County Commissioners and the FFPD's Board of Directors, as amended from time to time;
- All development, water and construction plans must be reviewed and approved by the Fire Department for compliance with the applicable fire code and nationally recognized life-safety standards prior to final plat or construction permit being issued; and,
- All development or construction projects shall meet the fire code and nationally recognized standards' pertaining to fire protection water. Please note that approved and inspected fire cisterns are permitted by the Fire Department in an attempt to help the property owner/developer meet these requirements (Appendix A).

The three staffed FFPD stations are:

- Station 1, 12072 Royal County Down Road, Peyton (7.6 miles from Site)
- Station 3, 7030 Old Meridian Road, Peyton (9.7 miles from Site)
- Station 4, 2710 Capital Drive, Colorado Springs, CO (17 miles from Site)

The closest station to the Site entrance is Station 2 located at 14450 Meridian Road and 2.6 miles south of the Site. Since Station 2 is unstaffed, response usually comes from Station 1 and the estimated response time is 12 minutes (per phone conversation with Fire Chief T. Harwig on September 28, 2018). Equipment at Station 1 includes an engine, a water tender (water truck), a brush truck, an AMR ambulance, a utility truck, and a command vehicle (FFPD, 2018). Equipment at Station 2 includes a 4-wheel drive engine, a water tender, and a brush truck.

In a developed area, firefighting water supplies are typically available through hydrant systems. However, rural areas are dependent on cisterns. The project would construct a 30,000 gallon cistern to serve the Site. The cistern would be operated and maintained by Fire Department staff. All residential properties within 5 road miles of any FFPD station have an ISO insurance rating of Class 3.

4.2 General Design Standards

The 2018 County Development Standards for Fire Protection and Wildfire Mitigation must be followed for the common areas and all newly constructed buildings. Common area standards include water supply, roads, bridges, and access gates. Lot development standards include those for buildings, driveways, propane tanks, and gates.

4.3 Wildfire Hazard Reduction

Based on information provided by the previous property owners, wildfire hazard reduction was completed for 62 acres of the Site between 2013 and 2015 (Appendix B). Although approximately 100 acres of the Site is

forested, tree density is low in many areas (which would explain why only 62 acres were mitigated). Wildfire hazards were reduced by reducing tree densities, removing ladder fuels and modifying stand structure. Additionally, overall forest health was improved by removing trees that were suppressed, poorly formed, insect and disease infested, or storm damaged in order to reduce competition and improve growing space for residual trees. Additional wildfire hazard reduction may be necessary to meet County standards; however, this will be largely dependent on the location of new buildings.

4.4 Construction in Wildland Fire Areas

Since the Site includes high hazard areas, a “Wildland Fire Risk and Hazard Mitigation Plan” must be prepared by a qualified professional and shall be tailored to the stage of development application and the stage of subdivision-related construction. A higher level of plan may be submitted at any stage of the process so long as it is implemented at the final stage of development. Plans shall utilize the Colorado State University (CSU) Guidelines and National Fire Protection (NFPA) standards, as applicable. Additional fire precaution measures may be required because of fire hazard in the following areas:

- Forested areas;
- Areas rated as fire hazards by the CSFS;
- Where slopes in or adjacent to proposed development are in excess of 20%; or
- Where the local fire protection agency identifies a specific fire danger.

All structures potentially threatened by wildland fire shall be designed, located, constructed, and maintained per the County Development Code for Construction in Wildland Fire Areas. The wildland fire area requirements should be incorporated into the Covenants, Conditions, and Restrictions (CC&Rs). Prior to building permit authorization in high hazard areas, a “Risk and Hazard Rating Analysis” shall be performed to determine the level of the wildland fire threat, unless completed as part of the “Wildland Fire and Hazard Mitigation Plan.”

5.0 Summary

The forested areas and scattered trees on the Site are mapped as High Hazard (El Paso County, 2007) (Figure 5). Since the Site includes high hazard areas, a “Wildland Fire Risk and Hazard Mitigation Plan” must be prepared and will more accurately map the areas of high wildfire hazard on the Site. Wildfire hazard reduction was recently completed for much of the forested portions of the Site and should reduce the overall wildfire risk. The site development plan must conform to County Development Standards for Fire Protection. Construction on each lot must comply with the County Development Standards and this should be referenced in the CCRs. Buildings should be sited away from trees in order to reduce fire risk and minimize clearing.

Ecospas has provided an additional reference to assist the residents of the Site in meeting both County and State requirements by appending the Community Wildfire Protection Plan for Unincorporated El Paso County “A Continuing Process” (El Paso County Sheriff’s Office Emergency Services Division, 2010) to this Plan (Appendix C).

Re: Conditional Commitment to Provide Emergency Services
Property: McCune Ranch

Douglas,

Based upon the information you have provided, the above-referenced real property is located within the jurisdiction and boundaries of the Falcon Fire Protection District ("Fire Department"). By this letter, the Fire Department confirms its commitment to provide fire suppression, fire prevention, emergency rescue, ambulance, hazardous materials and emergency medical services (collectively, "Emergency Services") to the property, subject to the following conditions:

- ☒ All new construction, renovations or developments within the Fire Department's jurisdiction must comply with the applicable fire code and nationally recognized life-safety standards adopted by the El Paso County Board of County Commissioners and the Fire Department's Board of Directors, as amended from time to time;
- ☒ All development, water and construction plans must be reviewed and approved by the Fire Department for compliance with the applicable fire code and nationally recognized life-safety standards prior to final plat or construction permit being issued; and,
- ☒ All development or construction projects shall meet the fire code and nationally recognized standards' pertaining to fire protection water. Please note that approved and inspected fire cisterns are permitted by the Fire Department in an attempt to help the property owner/developer meet these requirements.

Please do not hesitate to call the fire administration office or me for further information between 9:00 am and 4:00 pm, Monday through Friday.

Sincerely,
Trent Harwig
Fire Chief/Administrator

APPENDIX B

Liss Wildfire Hazard Reduction Scope And Payment Application

Scope of Work

Liss Property EQIP_2013-2015

Purpose:

Perform Forest Stand Improvement and Forest Slash Treatments that will:

- Reduce wildfire hazards by reducing tree densities, removing ladder fuels and modifying stand structure.
- Improve overall forest health by removing suppressed, poorly formed, insect and disease infested trees and storm damaged trees. Reduce competition and improve growing space for residual trees.

Location and General Description of Work:

The Liss property is located in portions of the NE¹/₄, NW ¹/₄, S ¹/₂, SE ¹/₄, and W ¹/₂ of Sections 13, 19 and 24, Township 11 South, Range 65 West in El Paso County, Colorado. The project area consists of one private property parcel located off of Meridian Road and Highway 83. The Colorado State Forest Service (CSFS-Franktown District) Forester will be the Technical Service Provider (TSP) and a Service Agreement is in place with the landowner for this project.

Work involves Timber Stand Improvement and Forest Slash Treatment activities in a dominant ponderosa pine forest. Both activities will follow the EQIP requirements and standards for each activity (descriptions of both are attached to Scope of Work).

Unit Description:

The Liss Project area is one (1) management unit consisting of two blocks. The entire treatment area has a gross acreage of approximately 62 acres. Ponderosa pine trees are the dominant species in both blocks with intermittent Gambel oak throughout.

The management unit and fields (blocks) are shown on the attached maps and is described in the following table:

| Unit Number | Field numbers | Land Ownership | Acreage | Treatment Period |
|-------------------|---------------|----------------|------------|------------------|
| 1 project. | 1-6 | Private | 5 acres | Sept. 2013 |
| | | Private | 34 acres | Dec. 2015 |
| | | Private | 7 acres | |
| | | | 10.5 acres | |
| | | | 5.5 acres | |
| Total | | | 62 acres | |

Slope Distribution (Based on DEM maps)

| Field numbers | 0-30% (acres) | 31-45% (acres) | 46% + | Total Acres |
|---------------|--|----------------|-------|-------------|
| 1-3 | 62 *** majority of acres fall in the 0-8% slope range | 0 | 0 | 62 |
| Total Acres | 62 | 0 | 0 | 62 |

Project Boundary Marking

| Unit Number | Field Numbers: | East, West, North and South Boundary Designation |
|-------------|----------------|--|
| 1 | 1, 2 and 3 | fence line, natural meadows and pink flagging |

Forest Management Treatments:

- The project will involve performing timber stand improvement and forest slash treatments of forested areas (ponderosa pine and Gambel oak). Thinning shall be accomplished via mechanical mastication and handwork with chainsaws
- Where possible landowner will harvest trees for firewood to help reduce depth of material on the ground. Slash disposal shall be by means mastication.
- Use of equipment that is comparable to a rubber tired Bobcat with a Fecon head mulching attachment for mastication will be used by the landowner on this project. Other equipment such as an ATV, Trailers, pruning loppers and chainsaws will also be used.
- Trees and oak will be thoroughly mulched/masticated. Chips and chunks will be well distributed across the project area with a desired average of 3-inches or less. All tops and slash must be processed on site via mechanical mastication.

Prescriptions:

- Masticate whole trees concentrating on sizes of 7 inches and less dbh to achieve 70-80ft²/acre of basal area. Goal is to treat all ponderosa pine acting as ladder fuels and that are overtopped, poorly formed (bent, broken topped, forked), damaged, diseased (bark beetle, severe mistletoe) and excessive (dense clumps). Thin all trees to create a 10-foot spacing between tree crowns.
- Trees will be thoroughly masticated to reduce the amount of large woody fuels as possible. Chips and chunks will be well-distributed across the project area with a desired average depth of 3-inches or less. Any tops or other large material left following the mulching must be less than 18" in height. ***If necessary, such material may need to be lopped with chainsaws and scattered by hand.***
- Large pockets of ponderosa pine seedlings and saplings (0-4" dbh) should be hand thinned out and whole trees masticated. Landowner should focus on retaining trees that have a full, healthy crown, straight main stem/trunk (no forks or cracks) and free of all insect and disease. Tree spacing for residual trees should be a minimum of 5-10 feet.
 - Thicker clumps growing underneath the dripline of the mature overstory trees should be all masticated to remove ladder fuels, decrease competition for water, sunlight and nutrients and increase growing space for the residual trees.
- Small, healthy widely dispersed pockets of ponderosa pine seedling/sapling trees can be retained only if they are not considered ladder fuels and will grow as single trees in the stand. If there are individual isolated trees in the 8 inch dbh and less range they can be retained if they are located at a minimum of 30 feet (stem spacing) from other remaining trees.

- Trees 7" in dbh and greater are recommended to target as harvest trees (trees removed, limbed and topped, skidded and decked to an area landowner can access). This will help to reduce the depth of woody debris on the ground and produce a wood product for the landowner to use, sale or trade for services.
- In areas where Gambel oak is present, priority will be to remove old, dead, decadent patches, especially those with significant top kill. A variety of oak heights and widths will be chosen for the remaining clumps. In areas where there are continuous oak thickets, irregular shaped openings will be cut to create a mosaic.
 - Throughout the oak there are isolated conifers or pockets of conifers (> 8"). All oak that is acting as ladder fuels underneath residual trees and within 20 feet of the dripline of those residual trees will be masticated.
 - Priority is to retain mature, healthy open clumps of oak to help maintain diversity and provide for important wildlife corridors.
- All down and dead, damaged, poor formed and wind thrown trees that are on the ground which are 8 inches and less dbh will be treated via mastication.
-
- Retain 2-3 snags per acre with a minimum diameter of 8 inches.
- All stumps will be 6 inches or less in height as measured on the uphill side.

Additional Performance Standards:

- The landowner should follow the outlined Scope of Work in this document as well as the EQIP requirement and standard sheets for Forest Stand Improvement and Forest Slash Treatment activities.
- In areas where machines have used a path repeatedly waterbars should be installed if the TSP and landowner deem necessary.
- Gates, fences, or signs damaged by the landowner will be repaired to a like or better condition, or replaced at the discretion of the Landowner.
- The TSP may recommend to landowner to suspend or limit operations if excess damage is occurring due to mud, snow, extreme fire danger, etc.
- Any soil contaminated by loss of fuel, oil, grease, hydraulic fluid, coolant or other fluids should be removed and placed in covered drums or other acceptable containers for proper disposal by the contractor.
- Areas with excessive rutting caused by the turning of tracked equipment, should be raked smooth to the original slope of the ground.
- Grasses and understory should recover nicely after treatment. Where soils slow or prohibit recovery re-seeding with native a native grass mix for the area is recommended.

Acknowledgements

In the development of this Community Wildfire Protection Plan, El Paso County received major assistance from the Coalition for the Upper South Platte (CUSP). The work of CUSP was funded by the American Recovery and Reinvestment Act (ARRA) of 2009, through a sub-grant awarded by the Colorado State Forest Service (CSFS).

From the beginning of the planning process in January 2010, through final approval, the staff of CUSP provided essential guidance, research, and GIS mapping. The El Paso County Office of Emergency Management gratefully acknowledges CUSP's many contributions to this CWPP.

Supporting agencies

Throughout 2010, the following organizations enthusiastically gave of their time, energy, and resources to assist the development of this CWPP. The El Paso County Office of Emergency Management gratefully acknowledges their contributions to this effort.

Local Community Wildfire Protection Plans in Unincorporated El Paso County

At this writing, in May 2011, the following communities in unincorporated El Paso County have completed their own Community Wildfire Protection Plans. These plans were valuable sources of information during the development of this CWPP for the unincorporated County.

Black Forest CWPP (2007)

Carroll Lakes CWPP (2007)

Crystal Park CWPP (2006)

Palmer Lake CWPP (2008)

Southwestern Highway 115 Fire Protection District CWPP (2007)

Ute Pass CWPP (2007)

Wissler Ranch CWPP (2010)

Woodmoor CWPP (2006)

An up to date list of all approved CWPPs is maintained on the Colorado State Forest Service web site¹.

Communities are highly encouraged to work together to create new local CWPPs that are tailored to the needs and priorities of their residents. These local plans provide the specific detail necessary to plan and execute local mitigation projects.

¹ "Colorado Community Wildfire Protection Plans," 3 May 2011
<<http://csfs.colostate.edu/pages/CommunityWildfireProtectionPlans.html>>

Introduction

Purpose, constraints, and goals

This Community Wildfire Protection Plan (CWPP) was created to comply with a mandate of the Colorado Legislature, while also meeting the requirements of CWPPs as defined in the Healthy Forest Restoration Act (HFRA). It was intended to do both of these things in a way that provides useful information to local communities as they plan for their own wildfire protection.

The Legislative mandate: A CWPP for the unincorporated County

Colorado Senate Bill 09-001, “Concerning the Establishment of Community Wildfire Protection Plans by County Governments,” requires each county government to prepare a CWPP “to address wildfires in fire hazard areas within the unincorporated portion of the county.”

In SB 09-001, the Legislature directed that this CWPP should only address the unincorporated portion of the county. This plan adheres to this direction, and does not set goals for municipalities.

However, we also recognize that small towns are the most significant values at risk in some rural fire protection districts, and that a wildfire that escapes control in an unincorporated area can quickly threaten municipal neighborhoods.

Municipalities are also important pieces of the overall picture of wildfire mitigation and suppression. For example, all of the County’s municipal fire departments maintain strong mutual aid relationships with fire departments in unincorporated areas.

This plan does not replace local CWPPs

At the beginning of this planning process, the Colorado State Forest Service (CSFS) advised El Paso County that this all-County plan would not replace any existing CWPPs that have already been completed by local communities. As a matter of fact, existing local CWPPs were used as reference sources in the development of this plan.

The CSFS also directed that this all-County CWPP does not remove the need for small local communities to develop their own CWPPs.

Local community CWPPs – prepared for individual towns, neighborhoods, or fire protection districts – capture the level of detail needed to take specific local actions. The development of local CWPPs brings together the neighborhood groups that plan mitigation projects and, in many cases, do the hands-on work.

Therefore, CSFS directed that this all-County CWPP should not be so detailed that it leaves nothing for local community planners to do. This approach respects the spirit of the national standards for CWPPs, which require local plans

to be specific about wildfire hazards, community values at risk, and the projects needed to protect those values.²

The special role of military installations

Community Wildfire Protection Plans are intended for non-Federal lands. Military installations prepare wildfire management plans for their own lands, but these plans are not the same as CWPPs.

However, El Paso County is home to five military installations, some of which control large areas of land in or near the wildland-urban interface. Because of this intimate relationship, the CSFS also directed the County to include the military in the planning process. Our military communities graciously participated in the development of this plan.

An umbrella... or a foundation

To comply with both the Legislative mandate for an all-County plan, and the spirit of the ideal CWPP as a detailed local product, the CSFS directed that this all-County CWPP should serve as an “umbrella plan” that encompasses more specific local plans.³ We prefer the image of this CWPP as a foundation that provides a common body of information to aid small communities as they develop their own, more detailed, CWPPs.

This plan uses a broad brush to paint a basic picture of wildfire behavior in El Paso County, and document the public policies and other issues that affect wildfire mitigation and suppression. We have also attempted to point out issues that local CWPPs should consider, and identify reference documents that local planners may find useful.

As each local community develops its own CWPP, it can avoid duplicating this research by referring to this foundation plan. The local CWPP can then focus on the details of its small area, documenting its specific wildfire hazards, community values at risk, and projects that can protect those values.

According to SB 09-001, “CWPPs can be as simple or complex as a local community desires.” In that spirit, we have aimed for this plan to be as simple as possible, while achieving the purposes described above.

² Society of American Foresters, “Preparing a Community Wildfire Protection Plan: A Guide for Wildland Urban Interface Communities” March 2004

³ Colorado State Forest Service, “Minimum Standards for Community Wildfire Protection Plans (CWPP)” 18 November, 2004

The process of developing this CWPP

The standard guidance for developing a CWPP advises a community to first form a core team that includes all local stakeholders. That team then meets frequently to guide every step of the process, from research through draft writing, then public comment and eventual adoption.

Some counties have successfully used this approach to develop all-County CWPPs. However, El Paso County is large, highly populated, and politically diverse.

Its jurisdictions (some of which overlap) include eight municipalities, twenty-one fire protection districts, two metropolitan districts with fire departments, five military installations, a state park and a national forest. Some parts of the County have many active citizen groups, while other areas have very few.

Its 2,158-square-mile area consists of arid plains, dense forests, and high alpine environments, each with different wildfire concerns. A person from the southeastern grasslands would be challenged to represent or understand the interests of someone in the northwestern foothills.

As we looked at this complex picture, we quickly saw that a core team that included all stakeholders would be too large and cumbersome to be effective. But to form one that was small enough to be manageable would require selecting representatives who still might not be able to represent all local concerns.

We settled on a hybrid approach that took all the traditional steps of CWPP development, but in an untraditional order.

A small steering team

We began by forming a very small steering team of only three people. This team concentrated on guiding the project through the process of gathering initial public input, conducting research, producing maps, and writing the draft, and submitting that draft for public comment and eventual adoption. The steering team functioned as staff for larger groups of community participants. However, the steering team did not make decisions about wildfire hazards or community values at risk, and did not determine priorities for mitigation.

The Steering Team

Kathy Russell, Emergency Preparedness Planner for the El Paso County Office of Emergency Management, worked with the County's many local fire chiefs to gather their input and concerns. She served as the lead researcher and principal author.

Marti Campbell, CWPP Facilitator for the Coalition for the Upper South Platte (CUSP), served as an overall consultant to ensure that the process and the final product would meet the published requirements for CWPPs. She also coordinated the production of the plan's maps, working with the GIS staff of CUSP. She facilitated each public meeting, and ensured that the public input process gathered the right type of information. Marti also located the state and federal subject matter experts who provided key input about land management and critical infrastructure protection.

Dave Root, Assistant District Forester for the Colorado State Forest Service (CSFS), made sure that the plan we were developing would meet CSFS requirements. A veteran of many CWPP projects, he helped us develop a valid planning process that worked for El Paso County.

Initial data gathering: Fire protection districts and sub units

One of the steering team's first tasks was to gather data and local concerns from community participants.

We gathered survey information from individual fire protection districts (FPDs), and metropolitan districts that operate fire departments. This made the most sense, because most unincorporated areas are not represented by a homeowners' association, but almost all are served by a local fire department.

We also needed to have initial face-to-face discussions with local communities, to gather their input about local wildfire hazards and the community values they want to protect.

It was impractical to hold a separate meeting in each of these special districts, so we settled on a middle-ground approach that divided the County into three "sub units" based on terrain and vegetation types. These sub units also tended to reflect the mutual-aid arrangements of local fire protection districts.

When presented with this two-level approach, the county's fire chiefs agreed that the surveys allowed each of them to express their individual ideas, while the sub unit meetings provided a way to discuss local issues without meeting with each individual FPD.

El Paso County CWPP Sub Units

Donald Wescott FPD
Green Mountain Falls Chipeta Park FPD
Southwestern Hwy. 115 FPD
Tri Lakes – Monument FPD
Woodmen Valley FPD

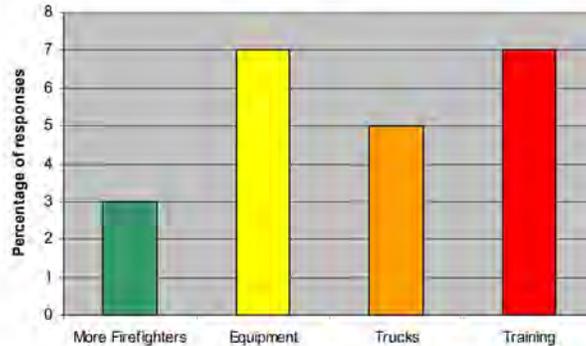

(Broadmoor FPD was not included in this sub unit because almost all of its territory is overlapped by the city of Colorado Springs.)

Fire Chiefs' surveys and maps

We began by sending a simple survey to each fire protection district; those surveys asked the fire chiefs to describe their district's readiness to respond to wildland fire, and list resources that they need to better respond. Each chief also received orthographic and topographic maps, and was asked to mark those maps with areas of concern.

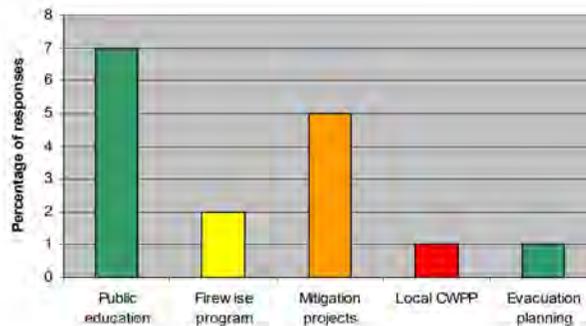

"Describe what your fire department needs most to improve your wildland firefighting capability."

All responses (11)

"Describe what your district - as a community - needs to be better prepared for wildland fire."

All responses (11)

Citizen surveys

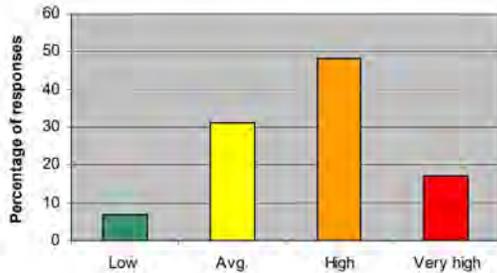

We also prepared a different survey for citizens, and asked each fire chief to distribute as many of these as possible. These surveys asked citizens to describe known local wildfire hazards, and describe community values that should be protected from wildfire.

We also asked questions to determine the level of citizens' confidence in their local first responders. It was gratifying to see that most citizens have a high opinion of their local fire departments, and are confident of their ability to respond to wildfire.

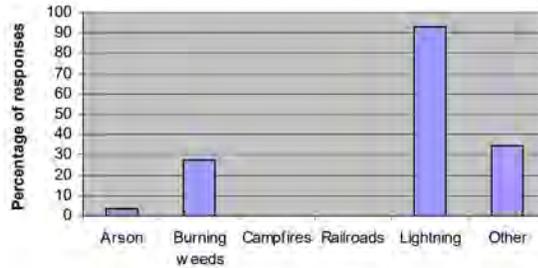

"How would you rate the wildfire risk in the area where you live?"

Hwy. 24 Corridor responses only (29)

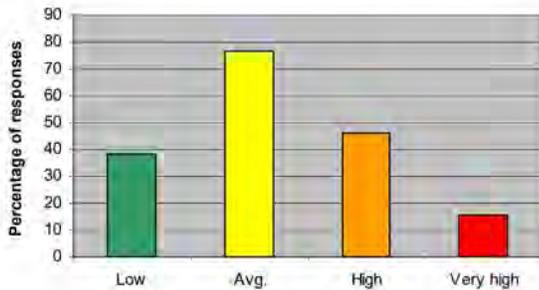

"What factor do you think is most likely to cause a wildfire in your area?"

Hwy. 24 Corridor responses only (29)

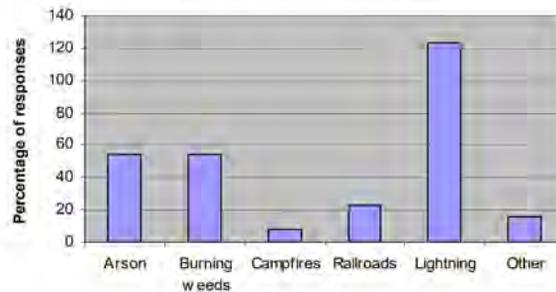

"How would you rate the wildfire risk in the area where you live?"

Southeast responses only (13)

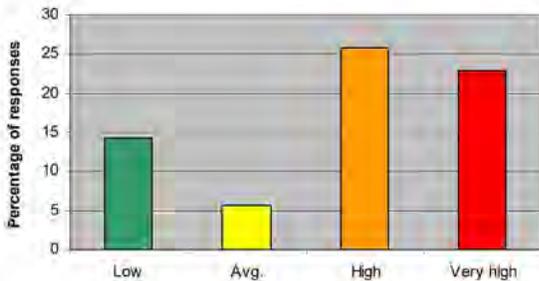

"What factor do you think is most likely to cause a wildfire in your area?"

"How would you rate the wildfire risk in the area where you live?"

Foothills responses only (35)

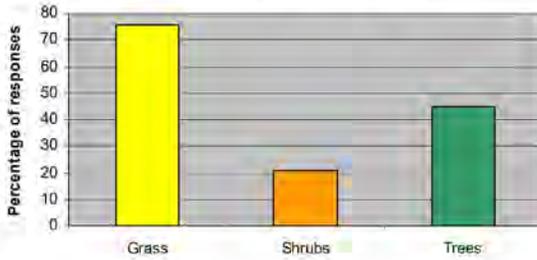

"What factor do you think is most likely to cause a wildfire in your area?"

Foothills responses only (35)

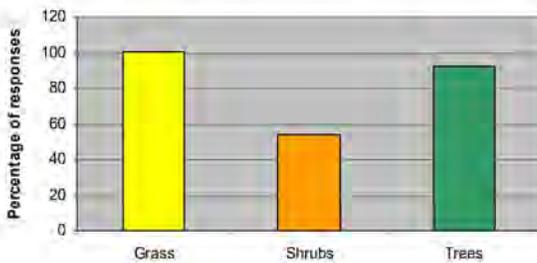

"What type of vegetation poses the greatest risk of wildfire in your area?"

Hwy. 24 Corridor responses only (29)

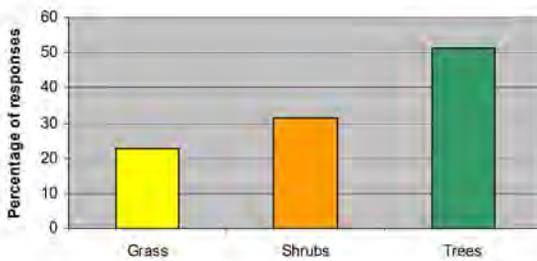

"What type of vegetation poses the greatest risk of wildfire in your area?"

Southeast responses only (13)

"What type of vegetation poses the greatest risk of wildfire in your area?"

Foothills responses only (35)

Public meetings to gather concerns

After most of the surveys had been returned and tabulated, we held a public meeting in each of the three sub units. At each meeting, we explained the goals of the CWPP and the process that would be used to develop it. We then presented the results of the survey to date.

The most important activity of each meeting was gathering input about each sub unit's specific wildfire hazards and values at risk. Citizens were provided with a large map of their sub unit, and asked to mark the map with known hazards and values at risk. Local community values typically included public buildings, such as schools or fire stations. Citizens also identified unique values at risk; for example, one Southeast community noted that its historic cemetery has wooden grave markers that could be destroyed by fire.

Even though the all-County CWPP does not describe local wildfire hazards or specify local projects, we felt that asking for local data could potentially help us identify patterns that applied to the County as a whole.

We looked for geographical patterns, such as wildfire hazards that extend across the boundaries of communities. We also looked for conceptual patterns, such as concerns about unsafe uses of fire, gaps in public education, or needs of local firefighters.

**Public Meeting: Northeast Sub Unit:
Hwy. 24 Corridor**
Thursday, July 1, 2010
Host: Falcon Fire Protection District

By capturing local data early in the process, we also saw another opportunity to help community leaders develop local plans. We made a commitment to preserve all of the local data gathered in surveys and meetings, and return the compiled data to each fire protection district for use in creating future local CWPPs.

These sub unit meetings brought together the people who would most likely work together on local wildfire mitigation projects. Not all local fire chiefs in each sub unit were able to

Public Meeting: Southeast Sub Unit
Thursday, July 8, 2010
Host: Ellicott Fire Protection District

Public Meeting: Foothills Sub Unit
Thursday, July 15, 2010
Host: Stratmoor Hills
Fire Protection District

attend each of these meetings. However, because of the way the sub units had been created, they were comfortable that their concerns would be represented by one of their local mutual aid partners.

To create the most complete picture possible, we requested that all fire protection districts participate in the surveys and meetings, even if a fire protection district already had a CWPP. Several districts with existing CWPPs took the extra time to provide data and participate in meetings.

Research

Before, during, and after the process of gathering initial public input, the steering team researched published literature, existing CWPPs, and hazard mitigation plans. We also consulted subject matter experts for technical guidance. These sources are noted in the footnotes.

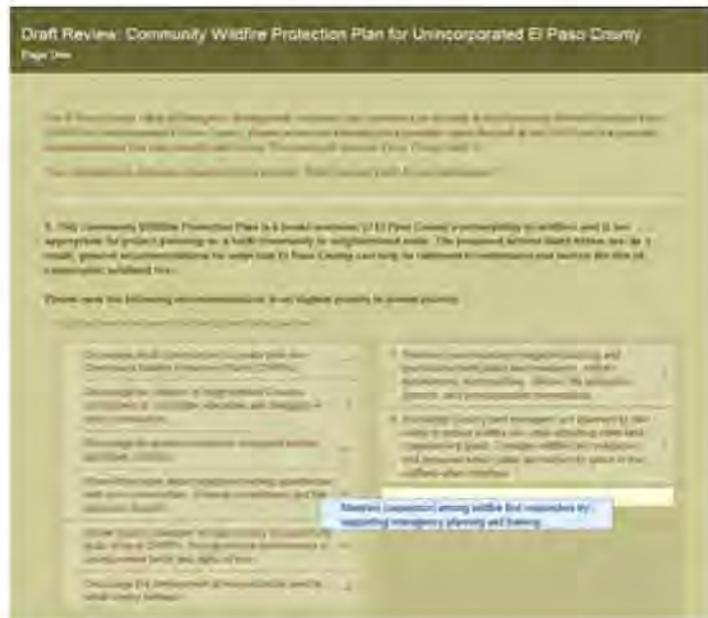

Draft review process

The steering team sent the near-final draft of this CWPP to every person or agency that had participated in the development process to date, as well as some who had expressed interest, but had not been able to attend meetings. A total of 68 participants received copies of the draft.

Along with the draft, the steering team also sent a list of proposed implementation actions. These proposed actions were developed based on the input gathered from sub-unit meetings, surveys, and meetings with stakeholders and subject matter experts.

Reviewers were asked to complete a short online survey, within two weeks, to prioritize the proposed implementation actions and provide comments on the draft.

The steering team incorporated the comments and prioritized actions into the final draft, which was presented for approval to the Colorado State Forest Service, the El Paso County Sheriff's Office, and the El Paso County Board of County Commissioners.

Adoption

A copy of the final draft was submitted for approval to the following:

- Colorado State Forest Service: District Forester Larry Long
- El Paso County Sheriff Terry Maketa
- El Paso County Board of County Commissioners: Chair Amy Lathen

El Paso County: The physical landscape

El Paso County is approximately 50 miles south of Denver⁴, and encompasses 2,158 square miles⁵.

The county shares boundaries with the counties of Douglas to the north, Elbert to the northeast, Lincoln to the east, Pueblo to the south, Fremont to the southwest, and Teller to the west.

The western edge of the County is extremely mountainous, as the Rocky Mountains rise abruptly from the dry plains that form most of the eastern portion of the County. Elevation ranges from 5,095 feet at the southern county line, to 14,110 feet at the summit of Pikes Peak.

The mountains that form the County's western edge capture most of the precipitation from east-moving weather systems. As a result, the County is a semi-arid alpine desert, with approximately 250-285 days of sunshine and 13-20 inches of precipitation per year. Relative humidity tends to be low, often in the single digits or the teens.

Average annual snowfall is 35-42 inches⁶; however, the snow is quickly melted by intense sunshine, and does not remain on the ground for very long in many parts of the County. Winds, including the occasional warm Chinook, also help melt snow and moderate the winter climate. In the spring, strong Chinook winds can rapidly reduce fuel moisture, and can create dangerous wind-driven fire behavior.

Physiographic Descriptions⁷

Northeast Sub Unit: The Highway 24 Corridor

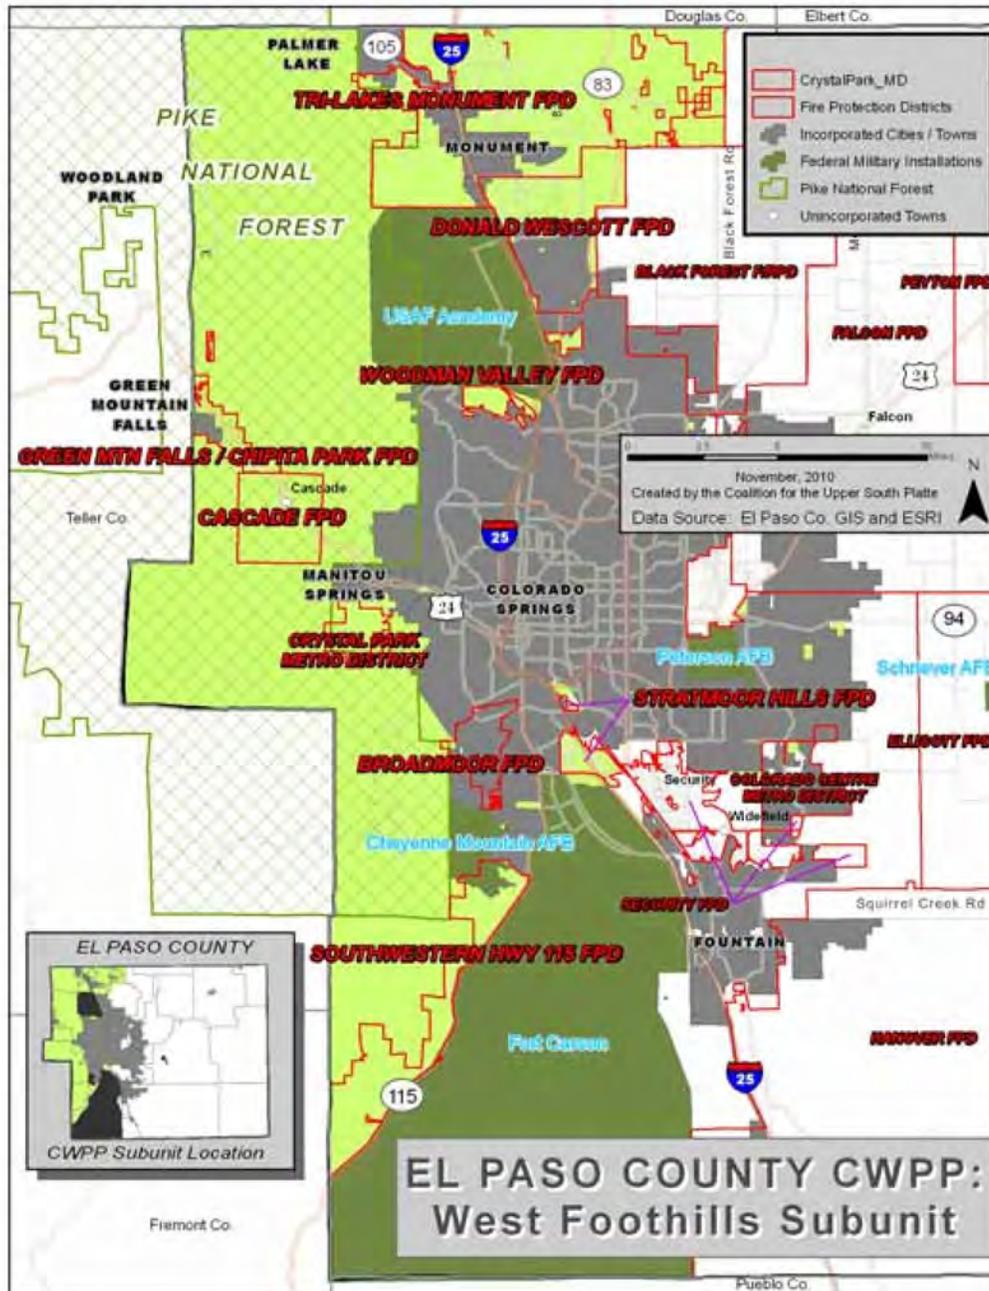

Soils on mild, semiarid foothills and plains: The soils in this area are on fans, terraces, ridges and side slopes in the central and northeastern parts of the county. The soils are nearly level to extremely steep. Soil textures are mostly

⁶ Patricia Baxter and Cynthia Sirochman, *Pre-Disaster Mitigation (PDM) Plan for El Paso County* (El Paso County Office of Emergency Management, 2006) 14.

⁷ Greg Langer, District Conservationist, Natural Resources Conservation Service (NCRC)

Average annual precipitation: 15-20 inches

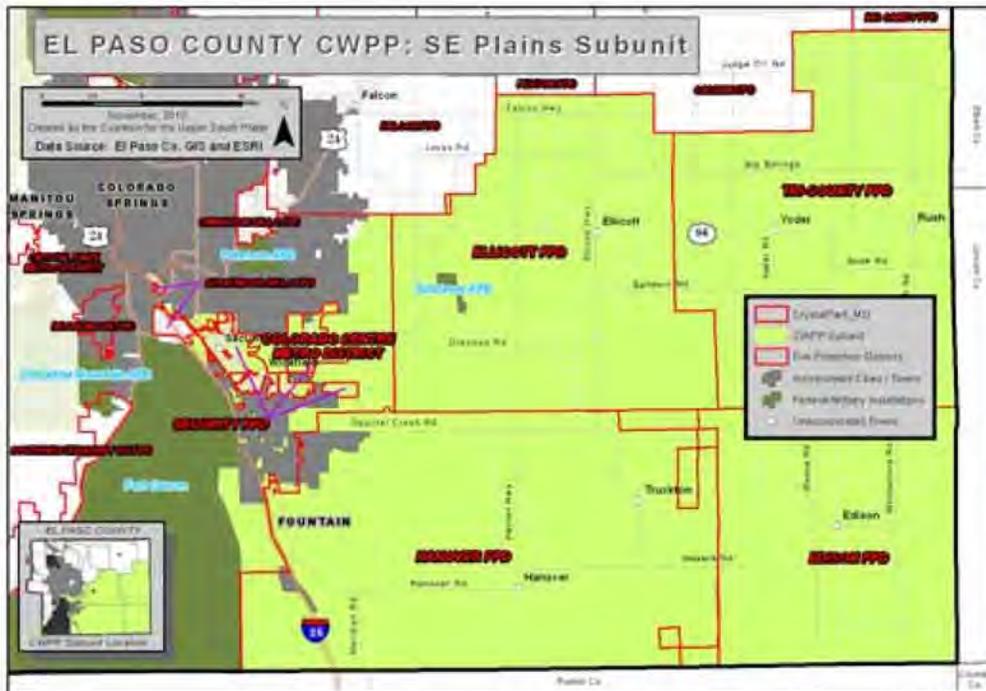

Vegetation: More than 50% forest, mainly ponderosa pine. The rest of the area is considered short grass prairie and consists of mainly native grasses with a scattering of non-native grass cover.

Population: Aside from the more mountainous areas, this unit is very heavily populated.

Agriculture: Agricultural land covers maybe 15% of the total area, with grazing being the dominant land use.

Southeast Sub Unit: The Plains

Soils on mild, semiarid to arid plains: The soils in this unit are on fans, terraces, hills, ridges and side slopes throughout the southern half of the county. The soils are nearly level to steep. Soil textures are mostly sand to loamy sand and range from gravelly loam to clay loam. Most of these soils were formed in alluvial and eolian material.

Average annual precipitation: 11-13 inches

Vegetation: This unit consists of roughly 85% native grass pasture or short grass prairie. Nearly 15% is considered cropland that is either hayed or Conservation Reserve Program (CRP).

Population: This unit is lightly populated with scattered subdivisions comprised mainly of 35-acre parcels.

Agriculture: Native grass pastures are predominately used for livestock grazing.

The human landscape

A brief history

The human history of El Paso County began at least 15,000 years ago with nomadic hunters and gatherers. Native American tribes were well established in the Pikes Peak region until the mid 1800s, when European trappers began establishing trading posts along the Arkansas and South Platte rivers.⁸

In 1858, the discovery of gold in Colorado brought an influx of population to the region. Population boomed again in 1891 when gold was found on the western slope of Pikes Peak, at Cripple Creek. In the western foothills of what would become El Paso County, many settlers provided supplies and services to mountain-based miners. In the eastern plains, ranching became the major occupation.

El Paso County was created just after the Colorado Territory was established in 1861; in 1876, Colorado became the thirty-eighth state of the Union.

According to the U.S. Census Bureau, the total population of El Paso County was 622,263⁹ in 2010, an estimated 20.4% increase since 2000. The County has eight incorporated municipalities, with a total combined 2010 population of 456,758. The population of the remaining unincorporated area was 165,505.

Today, the human landscape of El Paso County still follows the patterns begun in the 1800s. The eastern portion of the county, with its flat, dry grasslands, is sparsely populated and rural. The western part is home to most of the county's population, clustered in towns, cities and suburbs.

El Paso County Municipal Populations¹⁰

| | |
|------------------------------|---------|
| City of Colorado Springs | 416,427 |
| City of Fountain | 25,846 |
| City of Manitou Springs | 4,992 |
| Town of Palmer Lake | 2,420 |
| Town of Monument | 5,530 |
| Town of Calhan | 780 |
| Town of Green Mountain Falls | 640 |
| Town of Ramah | 123 |

The eastern-facing foothills have become heavily populated, due to their natural beauty and sweeping views. However, these slope-side communities, with heavy fuel loading of Ponderosa pine and Gambel oak, are highly vulnerable to fire. Many neighborhoods are accessed by only one narrow road, which makes it difficult to simultaneously evacuate residents and provide ingress to first responders. Fire,

smoke, or traffic congestion can block these single escape paths, endangering both residents and first responders.

Private ownership

Most of the unincorporated County is privately owned, in parcels that range in size from small lots to large ranches. Land use on small lots is primarily residential, including small home-based businesses. Large holdings are primarily used for cattle ranching and dry-land farming. Farm land enrolled in the U.S. Department of Agriculture’s Conservation Reserve Program (CRP) has been planted to resource-conserving vegetative covers.

Public lands

Pike National Forest

The largest area of public land in El Paso County is the Pike National Forest, which forms the county’s mountainous western edge. Many communities border the Pike, and a few small communities are surrounded by it.

Military installations

El Paso County is home to five major military installations:

- **Cheyenne Mountain Air Force Station** is the site of the subterranean Cheyenne Mountain Complex of the North American Aerospace Defense Command (NORAD). The installation consists of rugged mountain terrain, bounded by the Pike National Forest and the city of Colorado Springs.
- **Peterson Air Force Base** is located within the city limits of Colorado Springs, in short-grass prairie at the eastern edge of the city's suburban neighborhoods.
- **Schriever Air Force Base** sits several miles east of Peterson, surrounded by unincorporated prairie land.
- **The United States Air Force Academy** is Colorado Springs' immediate neighbor to the north, and also shares boundaries with three fire protection districts and the Pike National Forest. Its rolling wooded foothills, and sudden transition to steep mountainsides, are typical of the Foothills sub-unit.
- **Fort Carson**, the U.S. Army base at the southern edge of Colorado Springs, is also a neighbor to the city of Fountain and four fire protection districts. Most of its 137,000 acres are in El Paso County, with some of its area extending into Pueblo and Fremont Counties. Fort Carson's soldiers use most of this large area for mission-critical live-fire artillery and small arms training. This activity occasionally starts fires, some of which have extended beyond the base boundary.

All of these installations are located near to civilian neighborhoods, and three of them are located in traditional forested wildland-urban interface conditions: Fort Carson, Cheyenne Mountain Air Force Station, and the U.S. Air Force Academy. A fire that starts on one of these installations could potentially threaten residential neighborhoods, and vice-versa.

Some military infrastructure and activities also extend beyond the main base boundaries. For example, Fort Carson's railway spur runs through nearby neighborhoods in the Stratmoor Hills Fire Protection District. Weed control and other fire mitigation on those parcels remains the responsibility of Fort Carson, which prohibits public access to those areas.

State Trust Lands

The State Board of Land Commissioners (also known as the State Land Board) was established in 1876 to manage more than 3 million acres of land and 4 million acres of mineral rights that the federal government gave to Colorado to generate revenue for public education and some of the state's institutions.

The State Land Board generates revenue for its trust beneficiaries, by leasing State Trust Land for grazing, farming, or mineral development. El Paso County has 184,798.88¹¹ acres of State Trust Land, most of which is located in the eastern half of the County.

County-owned land

County parks represent the County's largest land holdings. County government does not own a significant portion of the overall area of the County, but the management of these areas is highly visible and can serve as demonstration projects.

Municipal lands

Municipally-owned lands in the County consist mostly of parks in the cities of Colorado Springs and Fountain. A few of the larger municipal parks include significant areas of natural terrain, such as Garden of the Gods and Cheyenne Canon, both in Colorado Springs.

Colorado Springs Utilities

Colorado Springs Utilities (CSU) is an enterprise, owned by the City of Colorado Springs, that provides electricity, natural gas, water and wastewater services to city residents.

Since the late 1800s, the City of Colorado Springs has acquired large tracts of land on Pikes Peak, to support the goal of ensuring a reliable supply of clean water. These lands – 13,000 acres in 2010 – have been set aside by City Ordinance to be held in trust as watershed reserves. Colorado Springs Utilities manages these lands to protect the water supply, water infrastructure, and forest resources.¹²

Mitigation challenges and constraints

Private ownership

Individual landowners are responsible for wildfire mitigation on their own properties. This is consistent with our current understanding of fire behavior in the wildland-urban interface (WUI). As research scientist Jack D. Cohen explains:

“The congruence of research findings from different analytical methods suggests that home ignitability is the principal cause of home losses during wildland fires. ... Home ignitability also dictates that effective mitigating actions focus on the home and its immediate surroundings rather than on extensive wildland fuel management. Because homeowners typically assert their authority for the home and its immediate surroundings, the responsibility for effectively

¹¹ Trust Land Ownership by County (as of June 2010), 25 October 25, 2010
<http://trustlands.state.co.us/MapsandData/Documents/county_acres1_060310.pdf>

¹² Naomi J. Marcus, *Pikes Peak Watershed Forest Management Plan* (Colorado State Forest Service, 2010) 3.

reducing home ignitability can only reside with the property owner rather than wildland agencies.”¹³

Many homeowners in El Paso County have embraced this principle, and have done substantial work to make their homes and properties more fire-resistant and defensible.

However, others have declined to manage vegetation, for a wide range of reasons. Owners of small lots value the visual privacy that thick brush provides. Others are discouraged by the large amount of work and expense required to mitigate their properties, and take the fatalistic attitude that “it’s insured.”

Economic factors

The cost of forestry work also creates a barrier to mitigation for many residents, even those with small lots. Those who are physically incapable of this work often have lower incomes. These residents cannot afford to hire contractors to create survivable (defensible) space or trim branches, even when they agree with the need to do so.

Owners of large forested holdings also face economic challenges, as these large parcels can be very expensive to thin. Standing timber in the County is generally too small or too inaccessible for commercial use, and there has been little commercial demand for small diameter wood or slash.

However, this economic picture may be changing. At this writing, some local industries are making plans to adapt their heating and power-generation systems to use woody biomass as fuel. Colorado Springs Utilities has redesigned one unit of its Martin Drake Power Plant to burn a mixture of ground wood and coal, and is seeking grants to fund the new systems to process the wood materials and inject them into the fuel stream.¹⁴

Home Owners’ Associations and covenants

A Home Owners’ Association (HOA) has the authority to dictate what changes homeowners may make to the exterior of their homes, such as paint color, landscaping style, or roof material. Some HOA rules and procedures have discouraged homeowners from removing vegetation to create defensible space. According to Colorado law, an HOA cannot prohibit homeowners from removing vegetation for fire mitigation purposes. However, homeowners are still required to submit their mitigation plans for HOA approval.¹⁵

Some county HOAs in WUI areas originally required wood shake roofs. Since then, El Paso County¹⁶ building regulations require the use of Class A

roofing materials when wood shake roofs are replaced on homes in the WUI. Colorado law also prohibits an HOA from requiring the use of cedar shakes or other flammable roofing materials.¹⁷ However, the process of replacing these roofs is slow and gradual, and these roofs will exist for many more years.

Fuel hazards in El Paso County

Why structures burn

In the context of a CWPP, a fuel is a hazard if it can ignite a structure. A burning structure, in turn, can create a hazard to other structures. According to wildfire researcher Jack Cohen, there are three principal ways that wildfires cause structural ignitions:¹⁸

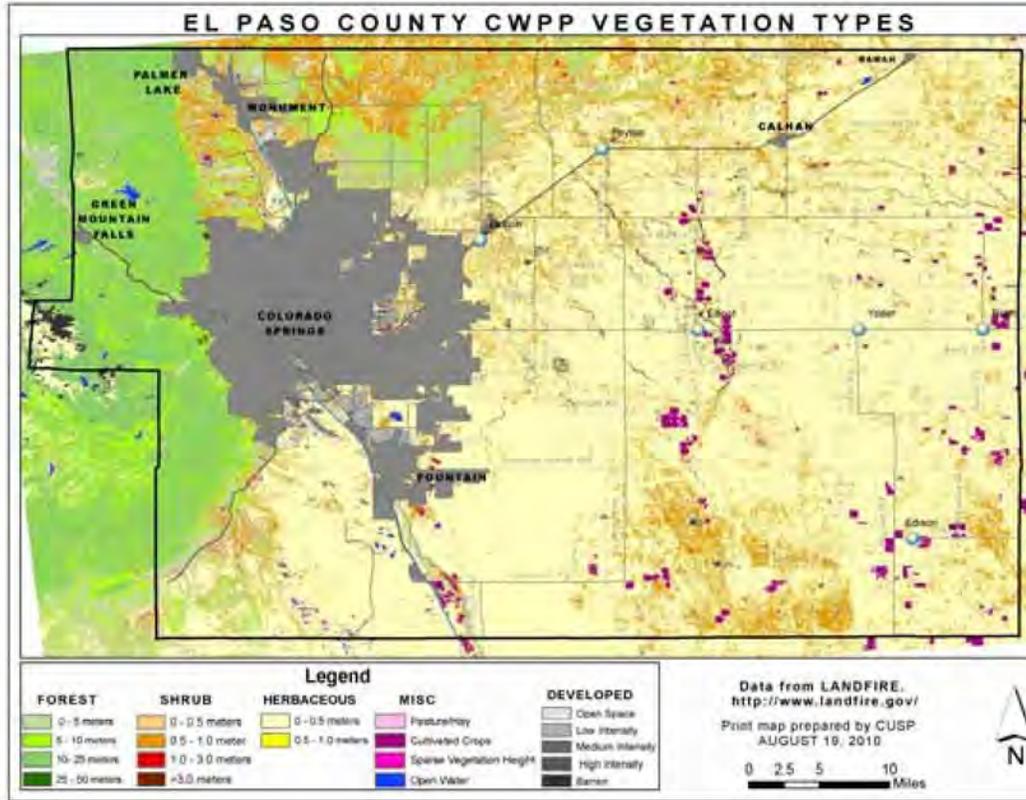

- **Flame impingement** means that flame has contacted the structure long enough to ignite it. This can range from small flames creeping through ground fuels, to large plumes of flame from nearby trees.
- **Firebrands (falling embers)** can blow through heat-broken windows, accumulate on dry decks or wood shake roofs, or be blown into stacks of firewood or piles of yard debris that are close to the structure. These small embers can gradually transfer enough heat to create small spot fires that may grow to destroy a home long after the main flame front has passed. Even a low-intensity fire can generate enough small embers to pose a risk to unprepared homes.
- **Radiant heat** from nearby fuels can ignite the outside of a structure, or break window glass to allow firebrands to enter. The effect of radiant heat on a structure depends on a variety of factors, including the intensity of the heat, the amount of the structure exposed to the heat, and the length of time the structure is exposed to the heat.

Two types of fuel hazards: Grasslands and Forest

As you can see in the *El Paso County CWPP Vegetation Types* map, the County's fuel types follow its topography: In the eastern half, with its relatively flat terrain, herbaceous vegetation (mostly grasses) and shrubs predominate. In the western portion, where foothills rise steeply to the Rampart Range, thick coniferous forests, often mixed with Gambel oak (*Quercus gambelii*), are typical.

¹⁷ Colo. Rev. Stat. § 38-33.3-106.5 (Mitchie 2011)

¹⁸ Cohen, J. D. and Butler, B. W., *Modeling Potential Structure Ignitions from Flame Radiation Exposure*, 1 January 2011 <http://www.firewise.org/resources/wui_hir.htm>

Both of these fuel types carry wildfire, but they do so in different ways and with different intensities. Both types pose risks to structures, residents and firefighters, but for different reasons.

Fire behavior in grasslands

Firefighters describe grasses and small shrubs as “light, flashy fuels.” Fires in these fuels can ignite explosively, and travel quickly, especially when driven by wind. When the wind changes direction, a grass fire will also change course suddenly, potentially putting firefighters and the public at risk. The high speed of wind-driven grass fires often leaves little or no time for public warning or orderly evacuation.

Grassland fires threaten homes from direct flame impingement on the home itself, or by igniting flammable items near or attached to the home. For example, fire will first ignite a fence, deck, trash pile, or stack of firewood, and those things will then ignite the home. Grass fires rarely generate enough heat for long enough to directly ignite structures through radiant heat alone.

Grass fires can also create embers that can roll along the ground with the wind, or be thrown into the air. During the Cross Plains fire in North Texas,¹⁹ many homes burned when embers from grass and shrubs fell onto wood decks, or entered unscreened vents in attics, eaves, or soffits. The vegetation of Cross

¹⁹Rich Gray, et. al., *Cross Plains, Texas Wildland Fire Case Study* (Texas Forest Service – Urban Wildland Interface Division, 2007)

Plains, Texas – fine grasses with shrubs – is similar to many areas of eastern El Paso County.

On the positive side, the low fuel density of grass and low shrubs supports short-duration fires that pass quickly. This type of fire generates relatively low levels of heat, and does not damage the organic material in topsoil.

Fire behavior in forests

Fires in heavy timber typically do not move and change direction as quickly as wind-driven grass fires, though under the right conditions they can move at great speed. During the peak of the 2002 Hayman Fire, the running crown fire traveled approximately one-half mile in four minutes, or more than seven miles per hour.²⁰ Thus, even though timber wildfires usually do not travel as quickly as grassland fires, a wind-driven crown fire can still travel quickly enough to make public notification and evacuation difficult.

These dense fuel loads also support long-lasting fires that can create intense levels of radiant heat for long periods of time, and often generate heavy loads of large firebrands that can be thrown far ahead of the flame front.

The dense forests of the western County provide the heavy fuel loads that can sustain these intense fires. Thousands of homes are located in these forests, often on steep slopes, accessed by narrow roads.

High-severity wildfires also represent one of the greatest potential threats to site productivity, soil resources, and aquatic ecosystems in the Colorado Front Range.²¹ The intense heat of a high-severity wildfire in timber can burn hot enough to consume all organic matter in the upper soil layer. Heavily-burned soils repel water, which not only interferes with germination of new vegetation, but also significantly increases runoff after rains.²² In the first few years after a severe fire, this increased runoff and erosion can create flooding hazards and ecological damage in areas downstream of heavily-burned areas.

Fire in El Paso County

Fire history

It is difficult to quantify the fire history of El Paso County, because responsibility for wildfire suppression and documentation is divided among many different jurisdictions. Most fires are small local incidents that a local jurisdiction usually manages with its own resources, and occasional help from its closest mutual aid partners. There is no central repository that collects data about all wildfires in the County.

The *Recorded Wildfires in El Paso County* table combines incident data recorded by the El Paso County Sheriff's Office Wildland Fire Crew, and researched by the Colorado Springs Office of Emergency Management.

| Recorded wildfires in El Paso County | | |
|---|--|--------------------------|
| Date | Name and description | Estimated acreage |
| 1854 | The Big Burn ²³ <i>Began on Cheyenne Mountain, and eventually extended to Wilkerson Pass.</i> | |
| 1890 | Cheyenne Mountain Burn ²² | |

<<http://www.thedenverchannel.com/news/17066840/detail.html>>

But it is safe to say that any vegetation in El Paso County has probably burned, and will eventually do so again. Many local vegetation species, particularly Ponderosa pine and aspen, are so well adapted to fire that it is necessary to forest health.²⁸

The return interval of wildfire depends on many factors.²⁹ Before the early twentieth century, Ponderosa pine forests were typically burned by frequent, low-intensity ground fires every five to thirty years. These fires maintained the Ponderosa forests as open pine savannahs. Today's dense Ponderosa stands have developed only after fire suppression became standard practice.

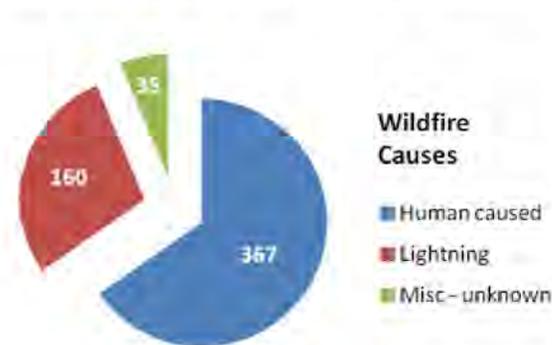

The high fuel density of these forests supports fires that are hotter and more extreme than the ground fires that these species evolved to survive. As a result, a high-intensity crown fire in a Ponderosa pine forest may eliminate entire stands, reducing the chance of a similar fire for many years.³⁰

Higher elevation forests, such as lodgepole pine and spruce, have a longer fire return interval, often as much as 300 years. Infrequent fires are more intense, and usually eliminate forest stands over a large area.

One analysis of available local data on significant wildfires estimates the probability of a significant wildfire occurring in any given year is 27%, or once every 3.5 years.³¹ Smaller fires, in lighter fuels, occur many times per year.

Fire season

The local fire season generally runs from spring through autumn. However, wildfires can and do occur during winter months, especially during mild, dry winters. Even during winters with normal precipitation, Chinook winds can reduce snow cover, dry fuels and create high fire danger.

Fire causes

The Wildfire Causes diagram summarizes thirty years of data from the USDA Forest Service, Pikes Peak Ranger District,³² demonstrating that people cause 57% of wildland fires. Thus, it is expected that areas of higher wildfire risk coincide with areas of higher population.

²⁸ Stephen A. Fitzgerald, *Fire Ecology of Ponderosa Pine and the Rebuilding of Fire-Resilient Ponderosa Pine Ecosystems* (USDA Forest Service, 2005)

³² Brent Botts, District Ranger, USDA Forest Service Pikes Peak District, email communication, August 2010.

Definition of wildland-urban interface (WUI)

When asked to describe the wildland-urban interface, most people tend to describe neighborhoods nestled in dense timber or heavy brush, “where the leaves meet the eaves.” In El Paso County, this description is certainly true.

That doesn’t mean that grassland fires are not a concern. Burning grass produces less overall heat than burning timber, but it can ignite unprepared structures. In August 2008, a wind-driven grass fire near Ellicott burned approximately 13 square miles in one afternoon, destroying three occupied homes, along with four unoccupied houses and ten outbuildings.³³

If both of these perspectives are true, then how should we define the wildland-urban interface of El Paso County?

In the term “Community Wildfire Protection Plan,” the key word is *community*. A CWPP is created by a community, and is intended to identify areas in which organized community action is required to protect community values.

In areas where people settle in areas of continuous dense timbered fuels, effective wildfire mitigation often requires significant reduction of fuels over a broad area. Those large-scale projects require cooperative action among groups of neighbors, and sometimes between neighborhoods and government.

In contrast, many homes in grassland areas can be protected by individual protective measures such as mowing, firebreaks, and structural features. Less organized community action is needed to increase the safety of these homes. However, this plan respects the fact that grassland wildfires pose great risks to unprepared homes, and will discuss the actions that individual homeowners can take to reduce the ignitability of structures in the grassland.

WUI = High fuel hazard + structures

Traditional small-area CWPPs typically define wildland-urban interface by outlining a community with a boundary that includes a generous buffer zone. That approach didn’t make sense for a broad foundation plan such as this one, so the steering team stepped back to consider the fundamental purpose of a CWPP.

A CWPP is concerned about the effect of wildfire on the things that a community values. Next to life itself, people value the things they have worked and invested to build: homes and workplaces, schools and community buildings, and shared infrastructure.

Thus, the WUI is a place where human values need protection from wildfire. If people live in a place with little to no fire risk, that place is not WUI. Likewise, if a place has a high fire risk, but no structures, that’s also not WUI.

In this spirit, this plan defines the wildland-urban interface of El Paso County as the areas of high fuel hazard that include human-built structures. To create a map of the County’s WUI, we used geographic information systems to

³³ *El Paso County Fire Destroys Three Homes*, 25 October 2010, <<http://www.thedenverchannel.com/news/17066840/detail.html>>

combine data layers that describe fire risk with those that show residential and commercial land development.

Where are the highest fuel hazards?

To define areas of high fuel hazard, we used data from the Colorado State Forest Service's Wildland Fire Susceptibility Index (WFSI), which was produced as part of its 2008 Colorado Wildfire Risk Assessment. The WFSI is a measure of wildfire threat that represents the probability that a wildfire will occur³⁴ at a given location.

The WFSI model combines the following datasets to derive wildfire threat:

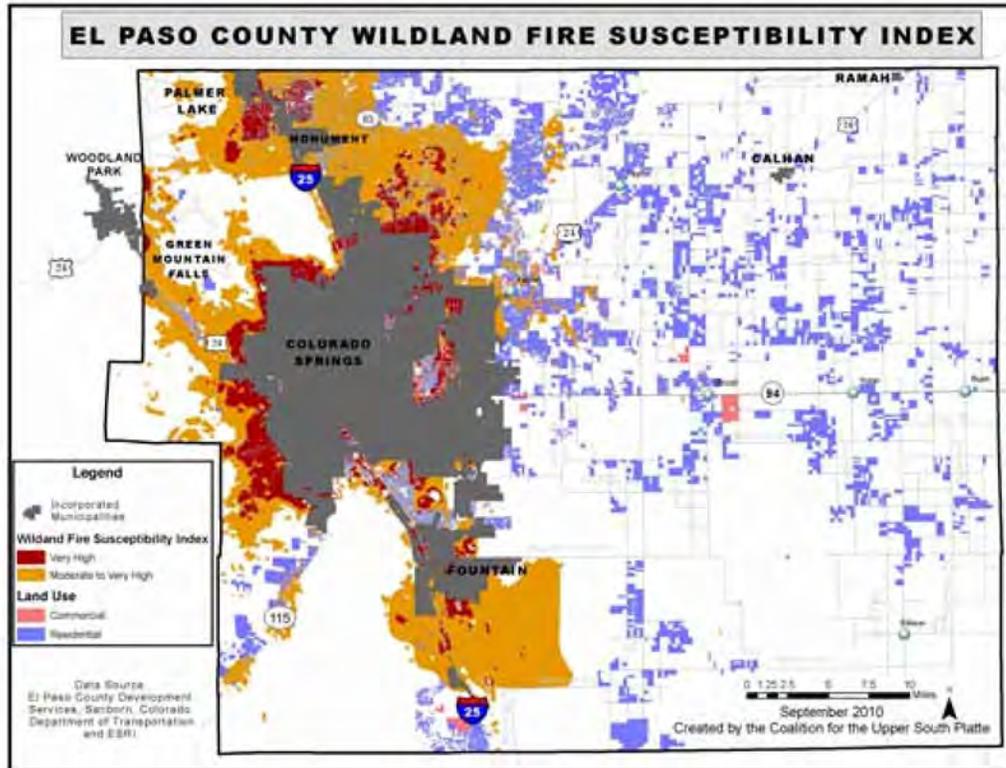

- Landscape characteristics, such as surface fuels, canopy characteristics and topography
- Historical weather observations
- Historical fire ignition locations
- Historical fire report data that reflects suppression effectiveness

The map *El Paso County Wildland Fire Susceptibility Index* shows areas in which the WFSI was rated at Moderate, High, or Very High. These ratings confirm that the County's greatest fuel hazards occur in areas of timber and heavy brush, typically on the east-facing slopes of the mountains, the Palmer Divide, and the Fountain Valley.

Where are the structures?

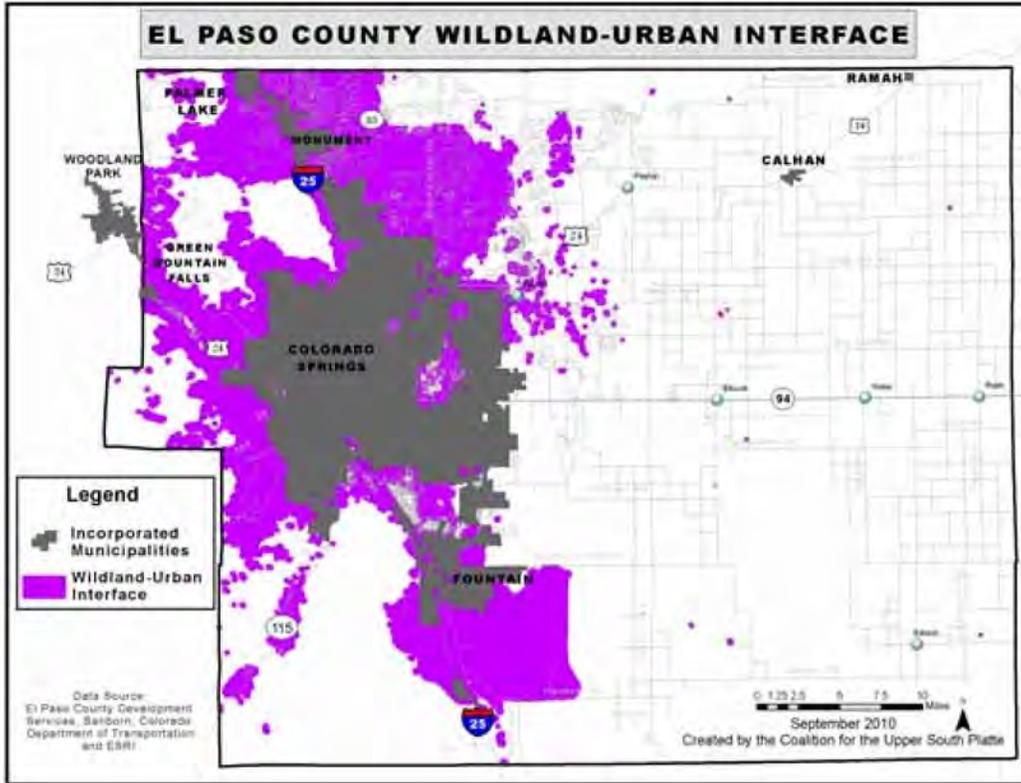

This map also shows land parcels that are currently used for either residential or commercial purposes. We judged that these land uses were most likely to be associated with human-built structures.

³⁴ Joe Duda, Skip Edel, et. al., *Colorado Statewide Forest Resource Assessment: Appendix B. Data Sources and Methods*
< <http://csfs.colostate.edu/pages/statewide-forest-assessment.html> >

The Wildland-Urban Interface Map

To create the *El Paso County Wildland-Urban Interface* map, the commercial and residential land use layer was combined with areas with a WFSI of Moderate or higher. A 100-foot buffer was then added around the resulting combination.

Because population tends to cluster in the more wooded western areas of the county, the WUI in this map coincides with the Moderate, High, or Very High areas of the WFSI map. While the overall potential for wildfire is relatively lower in areas rated Moderate, a fire that does occur there could threaten a large number of structures.

Community values to be protected

Lives and livelihoods

The planners assumed that lives and homes are people's highest values. Citizen surveys asked people to identify other values that they wanted to protect.

Locally important structures

Through surveys, and in community meetings, citizens indicated their concern for the following types of structures:

- Schools and day care centers
- Public buildings (police or fire stations, town halls)
- Historical sites
- Community gathering places (churches, cafes, meeting halls)
- Medical facilities

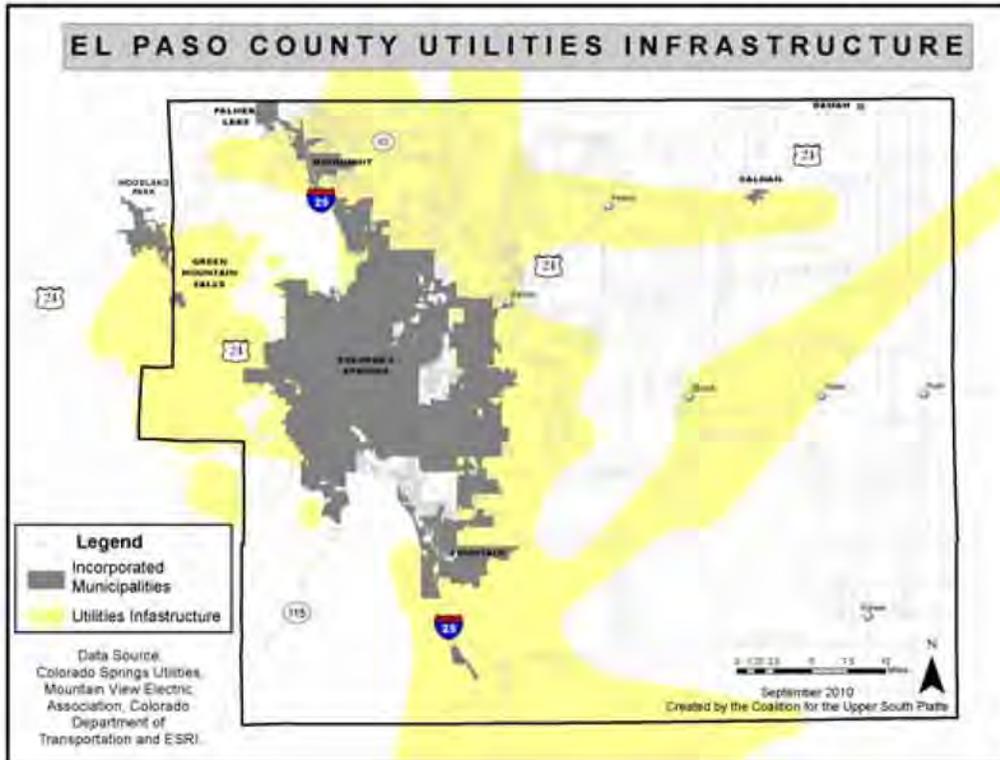

Protecting these individual sites will require local action that should be addressed in local CWPPs.

Infrastructure and lifelines

Citizens also want to protect elements of community infrastructure – those structures and systems that provide essential functions such as water, electricity, or communication.

El Paso County's wildland urban interface is mostly residential. All of the County's major medical facilities, the commercial airport, and most governmental facilities are located in municipal areas. However, the unincorporated wildland urban interface does contain some important critical infrastructure and community lifelines:

- **Electrical distribution facilities** are most vulnerable in local neighborhoods, where power lines are often hung at treetop height and supported by wooden poles.

The *El Paso County Utilities Infrastructure* map indicates areas that contain significant utilities infrastructure. This map intentionally omits details, to respect the security concerns of participating utilities.

As the *El Paso County Utilities Infrastructure* map shows, utilities infrastructure goes where the people are, and typically follows major roadways. However, some inter-regional systems follow separate corridors apart from the highway system.

- **Communication**, such as telephone cabling, is often installed on the same poles as electrical distribution wiring. Wireless communication (telephone, radio, and TV) relies on antenna towers, often located on high points that wildfire naturally seeks.
- **Watersheds and water distribution systems** are threatened by the flooding that commonly follows large fires. After large areas of vegetation have burned away, rain that would have been taken up by plants instead runs off, causing severe erosion. This runoff can be particularly heavy after high-severity fires that consume all organic material in the soil, and create a hydrophobic layer several inches below the soil surface.³⁵ Large amounts of ash, topsoil and debris can wash into streams, and clog reservoirs, pipelines, or treatment facilities, requiring costly rehabilitation and ongoing

³⁵ Jan Cipra, et. al., *Hayman Fire Case Study: Soil Properties, Erosion, and Implications for Rehabilitation and Aquatic Ecosystems* (USDA Forest Service, 2003) 206-207.

maintenance of these systems.³⁶ Water delivery systems that rely on surface water sources are most vulnerable to wildfire damage. According to Colorado Springs Utilities, “Catastrophic wildfire poses one of the greatest threats to water quality and collection system infrastructure.”³⁷

- **Roads and highways** provide evacuation routes for citizens leaving a wildfire-threatened area, and access for first responders attempting to enter. During a wildfire, transportation can be interrupted by smoke, flame from closely encroaching fuels, or falling debris. After a fire, mud and debris runoff can block roads, and flash flooding can wash out bridges and paving. However, when rights-of-way are kept clear of heavy vegetation, roads can serve as fire breaks that reduce the risk of wildfire spread, and as anchor points for firefighting operations.

Natural values

Citizens also expressed concern for natural amenities: parks, forests, and wildlife habitat.

County parks

The El Paso County Parks Department currently owns or manages more than 7,000 acres of park land³⁸, 85 miles of trail, and approximately 1,700 acres of conservation easements.

Most of the parks managed by the Parks Department are regional parks³⁹ that are typically 400 acres or larger. Regional parks are predominantly natural in character, but small portions of each park (usually around 20%) are developed with facilities for active recreation such as playfields, playgrounds, picnic shelters and asphalt play areas.

In 2010 the County began developing two Forestry Management Plans, for Black Forest Regional Park and the Pinerias Open Space.⁴⁰

The Department also manages neighborhood parks, trails, recreational areas, and the County Fair and Event Complex in Calhan. The neighborhood parks were acquired before the county limited its role to the provision of larger, regional parks and trails.

Cheyenne Mountain State Park

Cheyenne Mountain State Park adjoins the southern edge of Colorado Springs, the Cheyenne Mountain Air Force Station, and the Southwestern Hwy. 115 Fire Protection District. Located on the southeastern aspect of its namesake mountain, the park consists of 1,680 acres of foothills and steep terrain that is available for public use. Another 1,021 acres, on the mountain’s flanks and top,

³⁹ *El Paso County Parks and Leisure Services Department Master Plan*, September 2005

⁴⁰ Jerry Westling, El Paso County Parks Manager, E-mail communication, 19 August, 2010

was recently added to the park, and the public use of that land is in the planning stages. Both the main park and the expansion land have written fire mitigation plans.⁴¹

Wildlife habitats

Several areas of the County are owned by the State Land Board, and managed as natural areas or wildlife preserves by The Nature Conservancy.

- **Aiken Canyon Preserve**⁴², located about 16 miles south of Colorado Springs off Colorado Hwy. 115, includes the largest intact foothills ecosystem known from the Front Range. The 1,621-acre area contains one woodland and two foothills shrubland plant communities of special concern.
- **Chico Basin Ranch**⁴³ is a working cattle ranch that derives its income from grazing and running cattle.
- **Bohart Ranch**⁴⁴ is a large, unfragmented example of high-quality sandsage prairie. Like Chico Basin, Bohart is a working cattle ranch. The Nature Conservancy and the ranch manager jointly maintain the ranch's prairie ecosystem and manage its agricultural activities.
- **Hurricane Canyon** is a 520-acre site on the slopes of Pikes Peak. It includes two canyons, cut by the North and South Forks of French Creek.⁴⁵

Due to its great diversity of elevation, vegetation and climate, El Paso County is home to many animal and plant species that are listed as Threatened or Endangered under the Endangered Species Act of 1973, as amended. Among them are the following:

- Arkansas darter (*Etheostoma cragini*) - Candidate
- Greenback cutthroat trout (*Oncorhynchus clarki stomias*) - Threatened
- Gunnison's prairie dog (*Cynomys gunnisoni*) - Candidate
- Mexican spotted owl (*Strix occidentalis lucida*) - Threatened
- Preble's meadow jumping mouse (*Zapus hudsonius preblei*) - Threatened
- Ute ladies' tresses orchid (*Spiranthes diluvialis*) - Threatened

A map that shows individual wildlife habitats would be too detailed for this high-level plan. Important habitat areas occur across the county and may overlap each other. Thus, the *El Paso County Threatened and Endangered Species* map⁴⁶ has

⁴¹ Dave Root, CSFS Assistant District Forester, written comments, 23 March 2011.

⁴⁶ *El Paso County Threatened and Endangered Species*, Leslie Ellwood, Wildlife Biologist. US Fish and Wildlife Service, Ecological Services, Colorado Field Office. 2011

combined the actual or probable habitats of all of these species into a single area of concern. Much of this combined wildlife habitat area overlaps the County's wildland-urban interface, so wildfire mitigation projects must keep wildlife habitat in mind.

Mitigation projects are not necessarily prohibited in wildlife habitat areas. Some areas may be adversely affected by human activity, while other areas and associated species would benefit from fuel modification activities. However, if a mitigation project is proposed in or near an important habitat, the U.S. Fish and Wildlife Service should be consulted.

Wilderness

As of 2011, there are no wilderness areas designated in El Paso County. However the Beaver Creek Wilderness Study Area, on the south slope of Pikes Peak, is under study as a proposed wilderness area. The Study Area consists of 26,150 acres of public land in El Paso, Fremont, and Teller Counties, in granite canyons that are valued as wildlife and fish habitat. A 13,734 acre portion of the WSA is within an Area of Critical Environmental Concern (ACEC).⁴⁷

⁴⁷ Bureau of Land Management: Wilderness, 21 Sept. 2010
<<http://www.blm.gov/co/st/en/fo/rgfo/wilderness.html>>

Recommended methods to reduce structural ignitability

For purposes of this plan, zones one and two surrounding each home in the wildland-urban interface will be considered a polygon that is a high priority area for homeowner mitigation.

To reduce the chance that a structure will burn, two interrelated actions are recommended:

- Reducing or removing vegetation around the structure, to reduce both the radiant heat from burning vegetation, and the chance of direct flame contact to the structure.
- Reducing the flammability of the structure itself, by using fire-resistant building techniques and materials that reduce the chance of ignition from wind-borne embers.

Thinning to create survivable (defensible) space

Survivable space in timbered areas

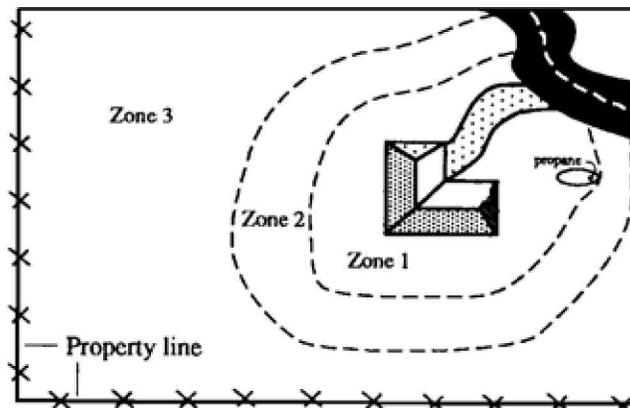

Survivable space (often called defensible space) is a series of reduced-fuels zones designed to protect structures from the heat of wildfires. This space can be natural or human-made. As fire advances through a survivable space toward a structure, the gradual reduction of fuel load causes a corresponding reduction in the speed and intensity of the fire.

According to *Creating Wildfire-Defensible Zones*,⁴⁸ a well-designed survivable space consists of three concentric zones:

Zone One is the space that immediately surrounds a structure; it extends 15 feet from the outermost edge of a structure, including any decks. The goal is to reduce or eliminate most large trees or shrubs within this zone, so that they cannot produce intense flames and heat capable of igniting the structure. A

few tall trees may be left in zone one if the lowest branches are pruned so that they are well above a fire resistant roof.

Zone Two surrounds Zone One. The width of Zone Two depends on the slope angle around the house, particularly on the side that slopes downhill. On the

⁴⁸ F.C. Dennis, *Creating Wildfire-Defensible Zones - no. 6.302*, Colorado State University Cooperative Extension, May 2003; reviewed January 2006.

downhill side of the house, if the average slope angle is less than 5%, Zone Two extends out 55 feet from the outer edge of Zone One. If the slope is more than 5%, Zone Two extends 85 feet from the outer edge of Zone One on the downhill side of the house. On all other sides of the house, the width of Zone Two is 55 feet from the outer edge of Zone One.

The main fuels reduction guideline for Zone Two is to thin the trees so that there is an average of ten feet of space between all tree crowns. All ladder fuels under trees should be removed. The branches of dominant trees should be pruned to a height of 8 feet above ground; small trees should have at least two-thirds of the green needles remaining.

Zone 3 is an area of traditional forest management and is of no particular size. It extends from the edge of the survivable space to the property boundaries.

Survivable space in grassland areas

Survivable space in grassland areas follows the same principles that apply to timbered areas. Homeowners should first remove all flammable vegetation within fifteen feet of the structure.⁴⁹ The survivable space should then be extended outward to a minimum of 70 feet around the home (on flat sites), by mowing grasses to a height of six inches⁵⁰ or less, thinning trees and brush, and removing dead vegetation.

Fire-resistant building practices

The survivability of a structure can be improved through the use of fire-resistant building materials, or by design features that limit the ability of embers to accumulate. Even existing structures can become more survivable when homeowners consider fire protection when upgrading a home or doing routine maintenance:

- When a combustible roof is ready for replacement, choose a non-combustible covering such as metal or tile.
- Cover all open vents with metal window screening, to prevent embers from entering the structure.
- Enclose soffits with solid coverings, to prevent hot gases from rising into the roof structure.
- Replace single-pane windows with double-pane windows.

The specific choice of building materials or design features depends on the vegetation and terrain surrounding the structure. The booklet *Firewise Construction: Design and Materials*⁵¹ offers a wealth of detail to guide homeowners.

What El Paso County government is already doing

Regulation of new development

The *El Paso County Land Development Code*⁵² regulates new development in unincorporated areas that are forested, or have been otherwise identified as being at risk of wildland fire, according to the Colorado Vegetation Classification Project.⁵³ The County maintains a map to identify the forested areas where the wildland fire standards of the Code apply. This map, *Wildfire Hazards Based on CVCP Indicators*,⁵⁴ appears below.

Before a permit is issued for building in these areas, a builder must commit to take actions to reduce the ignitability of new structures, and to support wildfire suppression activities. Examples of these actions include, but are not limited to:

- Provision of adequate routes for ingress, egress, and evacuation

⁵² *El Paso County Land Development Code, Chapter 6, Section 3.3: Fire Protection and Wildfire Mitigation*, 1 January 2011

<http://adm.elpasoco.com/Development%20Services/Documents/Land%20Development%20Code/ldc_chapter_6.pdf> 6-68

⁵³ *Colorado Vegetation Classification Project*, 23 March, 2011 <<http://ndis.nrel.colostate.edu/coveg/>>

⁵⁴ *Wildfire Hazards Based on CVCP Indicators*, 2 February, 2011

<<http://adm.elpasoco.com/Development%20Services/Documents/FireHazards.pdf>>

- Wildland fuels modification
- Provision of water supplies for firefighting
- Wildfire-resistant building design and construction
- Location of structures relative to wildland fuels and terrain

Developers are also required to have new projects approved by the local fire department, which may impose local regulations that are more stringent than those in the Land Development Code.

Support of local mitigation and suppression

Recycling yard waste and tree slash

The El Paso County Environmental Services Department, through its Solid Waste Management Division, and Forestry and Noxious Weeds Division, encourages individual mitigation efforts by providing free disposal⁵⁵ of forest slash, tree trimmings and vegetative yard waste. These programs also reduce the volume of slash sent to local landfills.

- **The Black Forest Slash-Mulch Program**⁵⁶ is highly successful slash recycling site made possible by interagency cooperation and local support. The site itself is owned by the State Land Board, which leases the land to El Paso County at nominal cost. Volunteers manage the site and offer information about mitigation and forest health. County funds pay for a large grinder that converts the slash into mulch, which is then given away.
- **The Yard Waste Recycling Program** is a cooperative effort between the County and private enterprise. A landscape supply business provides a site for free disposal of tree slash and vegetative waste, which it then converts into mulch for sale and use in its landscape projects.

El Paso County Sheriff's Office - Deputy Fire Marshal's Office

According to Colorado statute⁵⁷, the El Paso County Sheriff's Office is responsible for wildfire suppression in unincorporated areas. To fulfill this mandate, the office of the Deputy Fire Marshal manages and supports the El Paso County Sheriff's Office Wildland Fire Crew, an all-volunteer organization.

The Deputy Fire Marshal's office also supports small rural fire departments by facilitating interagency cooperation through both formal agreements and informal interaction. Wildfire suppression training is offered to county fire departments by the Wildland Fire Crew.

⁵⁵ *Recycling Programs*, 1 January 2011

<<http://adm.elpasoco.com/Environmental%20Division/Recycling%20Information/Pages/default.aspx>>

⁵⁶ *Black Forest Slash Mulch Program*, 1 January 2011 <<http://www.bfslash.org/index.php>>

⁵⁷ Colo. Rev. Stat. § 30-10-512 (Mitchie 2010)

In the spirit of more effective wildfire suppression, the Deputy Fire Marshal's office also supports wildfire mitigation and prevention whenever possible. By seeking and administering grant funding, the office has launched and managed mitigation projects that exceed the resources of rural fire departments. In 2010, the office received grants to reduce fuels in the following areas:

- Evacuation routes in the Southwest Highway 115 Fire Protection District
- Black Forest Regional Park in the Black Forest Fire/Rescue Protection District
- Fox Run Regional Park in the Donald Wescott Fire Protection District
- Fountain Creek Regional Park, adjacent to the Security Fire Protection District and the community of Widefield

During 2011, the El Paso County Deputy Fire Marshal's Office trained and sponsored a team of AmeriCorps volunteers to reduce dense fuels in several county parks. The team received training in basic wildland firefighting, and were available to assist the El Paso County Sheriff's Office Wildland Fire Crew with initial attack.

AmeriCorps National Civilian Community Corps (NCCC)

What the Forest Service is already doing

The USDA Forest Service, Pikes Peak District, performs approximately 2,000 acres of fuel mitigation projects annually, concentrating on wildland-urban interface areas.⁵⁸ Cooperation with fire education groups such as Pikes Peak Wildfire Prevention Partners (PPWPP), has resulted in mitigation projects around the Cheyenne Mountain Zoo, as well as other public areas in El Paso County.

What local communities are already doing

International Fire Codes

Some fire protection districts have adopted the *International Fire Code with Local Amendments*,⁵⁹ which requires certain building features and vegetation mitigation for new construction in wildland-urban interface areas defined by each local jurisdiction.

As explained in the Local Amendments, the regulations are "...consistent with nationally recognized good practice for the safeguarding of life and property within the designated urban-wildland interface area." They include

⁵⁸ Brent Botts, District Ranger, email communication, April 2011.

⁵⁹ *International Fire Code® Local Amendments: Falcon Fire Protection District; Tri-Lakes Monument Fire Rescue Authority; Black Forest Fire Rescue Protection District; Wescott Fire Protection District; Cimarron Hills Fire Protection District* (International Code Council, 2003) 50.

actions such as maintenance of defensible space, creation of adequate road access for fire apparatus, and installation of Class A roofing materials.

Public Education

As we have discussed, approximately 57% of all wildland fires are caused by human activity. Therefore, many fires could be prevented by education that changes human behaviors. Fire departments and local community groups are ideally positioned to educate their neighbors about wildfire prevention and safe outdoor fire use.

To support these efforts, high-quality educational materials are available for free download from the web sites of many organizations, such as the Colorado State Forest Service, the USDA Forest Service, the National Fire Administration, the National Wildfire Coordinating Group, and Firewise. This information can be directly delivered by firefighters and community leaders, or provided by linking to these sources from fire department web sites.

The nationwide Firewise program focuses on teaching homeowners how to build and landscape their homes to improve wildfire survivability. Firewise programs have been implemented in several fire protection districts and neighborhoods, to offer homeowner education and home risk assessments. Some programs also organize community mitigation projects, and encourage individual mitigation by providing neighborhood slash disposal.

At this writing, three neighborhoods in unincorporated El Paso County have been officially designated as Firewise Communities: Woodmoor, Ute Pass, and Wissler Ranch. Other small communities are working to earn this national recognition.

Colorado Springs development codes and mitigation programs

Much of the wildland-urban interface of the City of Colorado Springs consists of neighborhoods built in the steep mountain foothills of the city's west side. A line drawn on a map is all that separates these city neighborhoods from the rest of the Foothills Sub-Unit. So while Colorado Springs is not officially included in this CWPP, its mitigation actions in this area have important implications for adjacent unincorporated communities.

Colorado Springs requires new construction in its hillside neighborhoods to comply with its *Hillside Development Design Manual*. Along with best practices for safe and aesthetic development on steep terrain, the Manual mandates three types of actions to reduce wildfire risk: management of fuels and defensible space, fire detection and protection systems, and Class A roofing materials.⁶⁰

The Colorado Springs Fire Department's Wildfire Mitigation section works to build neighborhood awareness of wildfire risk, and guides individual neighborhoods through the process of organizing their own Firewise programs

⁶⁰ Paul Tice II, Brett Veltman, Bonnie Olson, Larry Larsen, *City of Colorado Springs Hillside Development Design Manual* (City of Colorado Springs, 1996) 42.

and mitigation projects. These activities also benefit the unincorporated County, as many residents of unincorporated areas are exposed to these messages and see these projects as they work and do business in Colorado Springs.

Military bases

El Paso County's five military installations encompass very large areas of both developed and undeveloped land. All of them have environmental management programs that align with the environmental stewardship priorities of the Department of Defense.

The U.S. Air Force Academy, located in the northern end of the Foothills Sub Unit, provides a good example of wildfire mitigation that both supports the installation's mission and benefits neighboring communities.

The Air Force Academy uses both prescribed burning and mechanical fuels reduction to improve wildlife habitat, reduce fuel loads, and to modify fuel models to reduce potential flame length and rates of flame spread. Gambel oak reduction along the Academy's northern and southern boundaries is also intended to hinder the spread of fire across the Academy grounds, and to reduce the chance of fire traveling between the Academy and nearby neighborhoods.⁶¹

Fort Carson, in the Southeast sub unit, maintains a fuel break along its perimeter, to reduce the chance that fire will extend across this boundary. The base also conducts an aggressive fuels reduction program to maintain vegetation health and reduce the danger of fire spread.

The base's rolling terrain and scrub vegetation, with few structures, allows more prescribed burning than is possible in other areas. The Fort Carson Fire Department often allows its mutual aid partners to participate in managing these prescribed burns, which improves interagency cooperation and provides valuable training opportunities to area firefighters.

⁶¹ U.S. Air Force Academy Natural Resources Department, U.S. Air Force Academy Fire and Emergency Services, USDA Forest Service, *Wildland Fire Management Plan for the U.S. Air Force Academy, Colorado* (U.S. Air Force Academy, 2008) 24.

Colorado Springs Utilities

Because of the large potential for a major fire to damage water resources, Colorado Springs Utilities conducts landscape-scale mitigation projects. When possible, these projects are designed to also improve the safety of nearby communities.

In the Ridge Road prescribed fire, October 2010, Colorado Springs Utilities reduced fuels on 114 acres on the slope of Pikes Peak, between North Catamount and South Catamount Reservoirs. Photo by Eric Howell, Colorado Springs Utilities

Until recently, most of these fuels-reduction projects used hand crews and mechanical techniques, but agency mitigation goals include the increased use of prescribed fire. In October 2010, Colorado Springs Utilities conducted a successful prescribed burn of 114 acres of the Pike National Forest on the North Slope of Pikes Peak.

Community preparedness to respond to wildfire

Jurisdictions that provide “full service” first response

Fire response in El Paso County is provided by a multi-layered patchwork of jurisdictions. A few areas of the county are not officially included in any of the following jurisdictions, while some areas are served by overlapping jurisdictions.

These “full-service” fire departments respond to both structure and wildland fires, provide emergency medical care, and offer rescue services and initial response to hazardous materials emergencies. They use a variety of staffing models: all-career, all-volunteer, or a combination of career and volunteer members.

Municipalities

All-career departments are typical in larger municipalities, while all-volunteer or combination departments (mix of volunteer and career staffing) are common in small towns and surrounding rural areas. For all-volunteer and combination fire departments, most of whose members work at day jobs, wildfire response time varies according to the day of the week and the time of day.

Fire Protection Districts

A fire protection district is a type of Colorado special district formed to provide firefighting, emergency medical services, ambulance services, rescue, or diving and grappling.⁶²

Most of the unincorporated area of El Paso County is served by 21 different fire protection districts (FPDs). Several of these FPDs extend past the border of El Paso County, to serve areas in two or more counties.

Most FPDs provide fire protection by operating their own fire departments. However, some FPDs provide all of their fire protection, or supplement their own fire department’s capacity, by contracting with a neighboring fire department to respond to emergencies within their jurisdictions.

Metropolitan Districts

Metropolitan districts are special districts that provide a wide range of community services, such as streets, drainage, water distribution, or fire protection. To provide fire protection, some metropolitan districts contract with neighboring fire departments, while others form and operate their own fire departments.

⁶² Colo. Rev. Stat. § 32-1-1002(1)(c) (Mitchie 2010)

Military installations

Each of the County's military installations is protected by its own all-career fire department. These military fire departments maintain strong mutual-aid relationships with their neighboring communities.

Specialized wildland fire teams

In addition to the full-service fire departments, some areas of the County are served by specialized wildland fire teams. Some of these teams respond to fires all over the County, while others concentrate on specific areas.

El Paso County Sheriff's Office Wildland Fire Crew

The El Paso County Sheriff's Office Wildland Fire Crew provides primary response to unincorporated areas that are not part of a fire protection district, all BLM and US Forest Service land within the County, and all State lands within the County. The Crew also helps County fire departments suppress fires in their jurisdictions, by providing firefighters and apparatus.

The Crew supports mitigation projects, such as neighborhood thinning and chipping programs, and prescribed burning operations.

Colorado Springs Utilities: Catamount Wildland Fire Team

As part of its mission to provide a dependable supply of clean drinking water to the City of Colorado Springs, Colorado Springs Utilities has gradually acquired large tracts of land on Pikes Peak⁶³. To protect its watersheds, CSU cross-trains some of its staff as a wildland fire team. The Catamount Team routinely responds to fires on CSU-owned lands, performs mitigation work, and manages prescribed fires in those areas.

Cheyenne Mountain State Park

This Colorado state park, in the southwestern foothills of the County, trains and equips its staff to respond to fires inside the park.

USDA Forest Service

Most of the County's mountainous western portion is part of the Pike National Forest. The Pikes Peak District is home to the Pike Hotshots and Pike Helitack, based near Monument, as well as two engines based in neighboring Teller County. Forest Service teams respond to any fire on National Forest lands, as well as fires within one mile of a National Forest boundary that might threaten National Forest lands.

The Forest Service also maintains multiple first response agreements with local jurisdictions, and participates in interagency training with fire protection districts. The Pueblo Interagency Dispatch Center coordinates air operations for all of southeastern Colorado, including El Paso County.

⁶³ Naomi J. Marcus, *Pikes Peak Watershed Forest Management Plan* (Colorado State Forest Service, 2010) 3.

Inter-jurisdictional cooperation

First responders and community leaders recognize that wildland fire does not respect jurisdictional boundaries, and that large fires can only be managed by pooling resources. As a result, El Paso County enjoys generally good cooperation among its many firefighting entities.

Standardized command and control

All County fire departments use the Incident Command System (ICS)⁶⁴ as a tool to manage interagency response operations. ICS clarifies roles and responsibilities in many common situations, such as when one fire department arrives first at a fire in a neighboring district, when one area belongs to two overlapping jurisdictions, or when an area is not part of any fire protection jurisdiction.

Shared radio communications

Most fire protection districts and municipal fire departments use a common digital radio system that allows them to directly communicate with each other, as well as with Sheriff's deputies or other first responders.

On an Incident Commander's request, the Sheriff's Office can provide enhanced radio communication support, additional command staff members, and a mobile command post for extended field operations.

Mutual and automatic aid

County fire departments have executed several agreements to provide mutual aid to each other upon request.⁶⁵ Groups of neighboring departments have also set up local automatic aid agreements, so that all departments in that group are dispatched to any fire in any of their jurisdictions.

The El Paso County Sheriff's Office participates in the *Annual Wildfire Operating Plan for El Paso County, Colorado*. The Plan, updated annually, describes how County agencies coordinate wildfire suppression activities with those of the Colorado State Forest Service, the Forest Service, and the Bureau of Land Management. It outlines rules and procedures for requesting mutual aid, ordering out-of-county resources, radio communications, and air operations.

An expanding hierarchy of resources

The responsibility for wildfire suppression initially rests with the jurisdiction where the wildfire starts.⁶⁶ The El Paso County Sheriff is responsible for suppression of wildfires that occur on unincorporated, non-federal land that is outside a fire protection district.

⁶⁴ < <http://www.fema.gov/emergency/nims/IncidentCommandSystem.shtm> >

⁶⁵ Civilian fire chiefs have signed the "Intergovernmental Memorandum of Understanding for Mutual Aid Between Fire Departments".

⁶⁶ Colo. Rev. Stat. § 29-22.5-103(1)(a)

If a wildland fire grows beyond a local fire protection district's ability to control, the Sheriff may appoint an incident management team to provide command and control over the fire response. At that point, the Sheriff also may assume financial responsibility for firefighting expenses, on behalf of El Paso County.⁶⁷

If the fire exceeds the County's capability to control, the Sheriff can request assistance from the Colorado State Forest Service, under the terms of the Emergency Fire Fund (EFF) Agreement.⁶⁸ When EFF is implemented, CSFS assumes responsibility and authority for all suppression activity until the fire has been controlled and management of the fire has been returned to the county.⁶⁹

County support to wildfire responses

El Paso County has a mature system for mobilizing County and community resources to support a wildfire response.

Public notification and warning

The Sheriff's Office has several methods to notify and warn people who are threatened by an approaching wildfire:

- Automated telephone notification
- Local news media announcements
- When possible, door-to-door warnings

Evacuation and sheltering

An Incident Commander may request evacuation of specified neighborhoods, or closure of certain roads; the actual evacuation is the responsibility of the Sheriff.

The El Paso County Emergency Operations Center coordinates evacuation and sheltering for displaced persons, as well as their service animals, pets, and livestock.

⁶⁷ Colo. Rev. Stat. § 29-22.5-103(2)(a)

⁶⁸ Colo. Rev. Stat. § 29-22.5-103(2)(c)

⁶⁹ Colorado State Forest Service; El Paso County Sheriff; Board of County Commissioners, El Paso County, Colorado; Forest Service, USDA; Bureau of Land Management, USDI, *Annual Wildfire Operating Plan for El Paso County, Colorado* (2011) 3 May, 2011 <http://csfs.colostate.edu/pdfs/2011_El-Paso-County_AOP_Final.pdf> 20.

Implementation Priorities

This Community Wildfire Protection Plan is a broad overview of El Paso County's vulnerability to and preparedness for wildfire, and is not appropriate for specific project planning. Even large "landscape scale" projects only make sense when viewed at close range, in the context of a fire protection district, a community, or a town.

The priorities listed below are, as a result, general recommendations for ways that El Paso County can help its residents to understand and reduce the risk of catastrophic wildland fire.

During the draft review process, survey participants ranked these recommendations in the following order of importance:

| Recommendation | Priority |
|---|-----------------|
| Encourage County land managers and planners to take steps to reduce wildfire risk while achieving other land management goals. Consider wildfire risk, mitigation, and response when codes are revised for areas in the wildland-urban interface. | 1 |
| Promote cross-boundary mitigation planning and prioritization with public land managers, military installations, municipalities, utilities, fire protection districts, and unincorporated communities. | 2 |
| Maintain cooperation among wildfire first responders by supporting interagency planning and training. | 3 |
| Share information about mitigation funding opportunities with local communities, Firewise committees, and fire protection districts. | 4 |
| Encourage the creation of neighborhood Firewise committees to coordinate education and mitigation in local communities. | 5 |
| Encourage fire protection districts to support wildfire prevention activities. | 6 |
| Encourage small communities to create their own Community Wildfire Protection Plans (CWPPs). | 7 |
| Advise county managers of opportunities to support the goals of local CWPPs, through normal maintenance of county-owned lands and rights of way. | 8 |
| Encourage the development of new industrial uses for small woody biomass. | 9 |
| Promote collaborative discussions about fuel reduction along boundaries of US Forest Service lands, including fire protection districts, municipalities, and public utilities. | 10 |
| Encourage mitigation projects undertaken by municipalities, military installations, and utilities, especially where adjacent to unincorporated areas. | 11 |
