SKETCH PLAN LAND USE

DRAINAGE MAP

1. General Location and Description

1.A. Location

The proposed Lorson Ranch Development is located portions of the north half of Section 23, the north half of Section 24, the south half of Section 13, the south half of Section 14 and the northeast quarter of Section 22 east of the county road known as Marksheffel Road, except any portion of said northeast quarter within the north lot of Brownsville Subdivision No.2 as recorded in plat book H-6 at page 81 of the County of El Paso, State of Colorado Records. The site consists of 1,400 acres, more or less, all in Township 15 South, Range 65 West of the 6th P.M., County of El Paso, State of Colorado.

As shown on the Vicinity Map included in Appendix A, the property is situated on both sides of Jimmy Camp Creek and its East Tributary, which run from north to south through the property. The property is bounded on the west by Marksheffel Road, and on the east by existing ranch land and the future Meridian Road. On the north the property is bounded by Banning Lewis Ranch, an undeveloped rural area within the City of Colorado Springs, and on the south by Peaceful Valley Estates, a residential subdivision and vacant golf course within El Paso County.

1.B. Description of Property

The site consists of developed, undeveloped areas, as well as land uses for agriculture and ranching. Jimmy Camp Creek flows from north to south near the western boundary. The East Tributary of Jimmy Camp Creek (which will be hereafter referred to as the East Tributary) enters the site at the center of the northern boundary, flowing south. In the southern part of the site, it turns west, turning south again before it reaches the main channel of Jimmy Camp Creek south of Lorson Ranch in the vacant golf course. The majority of the land between the two drainageways has been developed as part of Lorson Ranch. The land west of Jimmy Camp Creek is fairly flat, with slopes less than 2%. The land east and south of the East Tributary consists of hilly terrain with slopes up to 12%.

The owner plans to construct residential development, varying from low to high density, including schools and parks on the site. One commercial center is planned to be located at the west end of the site near Marksheffel Road. The electrical easement with transmission towers in it running through the eastern portion of the site will be set aside as open space and detention ponds. Fontaine Boulevard will be extended through the site as a major roadway. Local and collector roads will be constructed for access throughout the site. Please see the Drainage Plan located in the back folder of this report for an overview of the site plan.

2. Drainage Basins and Sub-Basins

2.A. Major Basin Description

The majority of the property is located in the Jimmy Camp Creek Basin. The majority of the site drains either to Jimmy Camp Creek or to the East Tributary, which both flow south/southwest towards the southwest corner of the property. A small portion of the southwest corner of the site drains away from Jimmy Camp Creek off of the property, where it drains into a small drainageway that returns to Jimmy Camp Creek further south. A portion of the southeast corner of the property drains to the southeast and is tributary to Williams Creek. The Jimmy Camp Creek Drainage Planning Study prepared by Kiowa Engineering will be used as a criteria reference for this design since it assumes full spectrum detention ponds in the developed conditions flow which should be adopted by El Paso County in January, 2015. The original 100-year floodplain boundary for the property is shown on map number 08041C0957-F of the FEMA Flood Insurance Rate Map for El Paso County, Colorado dated March 17, 1997 shown in Appendix B. In addition, Lorson Ranch has submitted and has received approval for two LOMR's on Lorson Ranch. The revised floodplain is shown on an exhibit in Appendix B. The floodplain limits are shown on the Drainage Plan included with this report. All proposed building envelopes for the subdivision will be located out of the post-development floodplain.

2.B. Sub-Basin Description

The existing topography consists of areas with slopes varying from 0.5% to up to 12%.

The development of this site will maintain the existing drainage patterns to the extent possible. Storm runoff will be directed to Jimmy Camp Creek and the East Tributary via overland flow, street and pipe flow, and open channel flow. Any channels or swales will be designed with erosion protection as necessary.

3. Drainage Design Criteria

3.A. Regulations

Drainage facilities have been analyzed in accordance with the *El Paso County Drainage Criteria Manual*, El Paso County, Colorado (The Criteria) for the 5-year and 100-year storms.

3.B. Development Criteria Reference and Constraints

The following reports and plans were reviewed in the process of preparing this drainage sketch plan:

1. *"Drainage Report for Sketch Plan Submittal for Lorson Ranch," prepared by Drexel, Barrell & Co, dated January 27, 2004.*
2. *"City of Colorado Springs/El Paso County Drainage Criteria Manual", prepared by City of Colorado Springs, El Paso County, dated October 1987, revised 1991.*
3. *Jimmy Camp Creek Drainage Planning Study, prepared by Kiowa Engineering Corporation for Banning Lewis Ranch, dated January, 2009.*

3.C. Hydrological Criteria

The design rainfall listed in the Criteria is the 5-year rainfall event for the minor storm and the 100-year rainfall event for the major storm. Per El Paso County criteria, the Rational Method was utilized to calculate runoff for basins less than 100 acres. This study did not calculate flows in either Jimmy Camp or the East Tributary but will use the flows calculated by Kiowa Engineering DBPS for JCC. The Soil Conservation Service (SCS) Hydrograph Procedure as described in the Criteria used to calculate runoff for basins in excess of 100 acres was not used since the DBPS runoff rates are used.

A hydrologic analysis for Lorson Ranch was performed utilizing Hydraflow Hydrographs software to determine the 5-year and 100-year runoff flows before and after development.

Undeveloped basins consist of native grass that has been grazed. There are a few trees on the undeveloped portions of the site and are mainly located next to the East Tributary. Developed portions of this site consist of typical urban development and one townhome development.

Basin A1

Basin A1 consists of existing lots developed as Meadows Filing No. 2&2a, Fontaine Boulevard, and Old Glory Drive. Runoff flows south in curb/gutter and storm sewer to existing Pond A1 where runoff is detained and treated for water quality. The total developed flow from this 57acre basin entering Pond A1 is 115cfs/238cfs for the 5/100-year storm event.

Basin A2

Basin A2 consists of existing lots developed as Ponderosa Filing No. 1 & 2 and Fontaine Boulevard. Runoff flows southwest in curb/gutter and storm sewer to existing Pond A2 where it is detained prior to entering storm sewer which flows to Pond A1. The total developed flow from this 21.6acre basin entering Pond A2 is 42.7cfs/88.6cfs for the 5/100-year storm event. This existing pond does not include water quality which is provided in existing Pond A1.

Basin A3

Basin A3 consists of existing lots developed as Ponderosa Filing No. 1, a vacant parcel (assumed to be developed), and Old Glory Drive. Runoff flows southwest overland and in curb/gutter and storm sewer to Future Pond A3. At Design Point A3 existing storm sewer picks up the runoff and conveys it southwest to Pond A1 where runoff is detained and treated for water quality. The total developed flow from this 15.8acre basin is 30cfs/76cfs for the 5/100-year storm event. This flow does not include outflow from Pond A4. The future pond A3 will need to be sized so the existing storm does not exceed the capacity of the existing storm sewer system in Old Glory Drive when the vacant lot is developed.

Basin A4

Basin A4 consists of existing lots developed as Pioneer Landing Filing No. 1 & 1a and a portion of Townhomes at Lorson Ranch. Runoff flows south in curb/gutter and storm sewer to existing Pond A4 where runoff is detained and treated for water quality. The total developed flow from this 21.2acre basin entering Pond A4 is 39.5cfs/82cfs for the 5/100-year storm event.

Basin A5

Basin A5 consists of existing lots developed as Buffalo Crossing Filing 1 & 2 and a portion of Townhomes at Lorson Ranch. Runoff flows southwest in curb/gutter and storm sewer to existing Pond A5 where runoff is detained and treated for water quality. The total developed flow from this 31acre basin entering Pond A5 is 60cfs/123cfs for the 5/100-year storm event.

Basin B1

Basin B1 consists of existing lots developed as Pioneer Landing Filing 1a, the future Pioneer Landing Filing No. 2 (assumed to be developed), Old Glory Drive, and Fontaine Boulevard. Runoff flows southeast in curb/gutter and storm sewer to existing Pond B1 where runoff is detained and treated for water quality. The total developed flow from this 52.5acre basin entering Pond B1 is 98.4cfs/204.2cfs for the 5/100-year storm event. Existing Pond B1 will need to be modified when Pioneer Landing Filing No. 2 is developed to meet the discharge conditions set in the approved MDDP1 for Lorson Ranch.

Basin B2

Basin B2 consists of existing lots developed as Meadows Filing No. 3. Runoff flows southeast in curb/gutter and storm sewer to existing Pond B2 where runoff is detained and treated for water quality. The total developed flow from this 38.3acre basin entering Pond B2 is 87.9cfs/195.5cfs for the 5/100-year storm event.

Basin B3

Basin B3 consists of vacant land. Runoff flows south overland to the East Tributary of Jimmy Camp Creek. The total undeveloped flow from this 6.8acre basin is 7.9cfs/18.7cfs for the 5/100-year storm event. When this basin is developed it will be required to detain developed flow to existing amounts including water quality.

Basin C1

Basin C1 consists of existing lots developed as Meadows Filing No. 4, Allegiant, and a portion of Meadows Filing No. 1. Runoff flows south in curb/gutter and storm sewer to existing Pond C1 where runoff is detained and treated for water quality. The undeveloped portions of this basin adjacent to the East Tributary are assumed to be developed since Pond C1 is designed to accept that flow. The total developed flow from this 110.5acre basin entering Pond C1 is 210cfs/435cfs for the 5/100-year storm event.

Basin C3

Basin C3 consists of lots developed as Meadows Filing No. 4. Runoff flows south in curb/gutter and storm sewer to Pond C3 where runoff is detained and treated for water quality prior to discharging to Jimmy Camp Creek. The total developed flow from this 14.8acre basin entering Pond C3 is 30.9cfs/64.1cfs for the 5/100-year storm event.

Basin C4

Basin C4 consists of vacant land adjacent to the East Tributary. Runoff flows south overland to the East Tributary of Jimmy Camp Creek. The total undeveloped flow from this 21.5acre basin is 21.3cfs/50.4cfs for the 5/100-year storm event. When this basin is developed it will be required to detain developed flow to existing amounts including water quality.

Basin D

Basin D consists of runoff from Carriage Meadows which was approved but hasn't been built yet. Runoff flows southeast via curb/gutter and storm sewer to a proposed detention pond and to the existing FMIC drainage ditch diversion. The drainage ditch diversion was constructed in 2006 and includes a storm sewer outfall for Carriage Meadows. Refer to the approved drainage report for Carriage Meadows. The total flow from this 27.5acre basin is 41.4cfs/86.8cfs for the 5/100-year storm event.

Basin F

Basin F consists of vacant land. Runoff flows west overland to the East Tributary of Jimmy Camp Creek. The total undeveloped flow from this 466acre basin is xcfs/xxcfs for the 5/100-year storm event. When this basin is developed it will be required to detain developed flow to existing amounts prior to entering the East Tributary of Jimmy Camp Creek.

Basin G

Basin G consists of vacant land. Runoff flows west overland to the East Tributary of Jimmy Camp Creek. The total undeveloped flow from this 92.1acre basin is 65.2cfs/158.8cfs for the 5/100-year storm event. When this basin is developed it will be required to detain developed flow to existing amounts prior to entering the East Tributary of Jimmy Camp Creek.

Basin H

Basin H consists of vacant land. Runoff flows northwest overland to the East Tributary of Jimmy Camp Creek. The total undeveloped flow from this 181.7acre basin is xcfs/xxcfs for the 5/100-year storm event. When this basin is developed it will be required to detain developed flow to existing amounts prior to entering the East Tributary of Jimmy Camp Creek.

Basin J

Basin J consists of vacant land on Lorson Ranch and existing residential developments in the City of Fountain, and the existing large lot rural subdivision in El Paso County. Runoff flows north overland to the East Tributary of Jimmy Camp Creek. The total flow from this 58.2acre basin is 99cfs/219.1cfs for the 5/100-year storm event. When this basin is developed it will be required to detain developed flow from Lorson Ranch only and the offsite flow to existing amounts prior to entering the East Tributary of Jimmy Camp Creek.

Basin K

Basin K consists of vacant land in the northeast corner of Lorson Ranch. Runoff flows northwest overland and drains offsite to the north. The total undeveloped flow from this 16.1acre basin is 17.6cfs/41.7cfs for the 5/100-year storm event. When this basin is developed it will be required to detain developed flows to existing amounts prior to discharging to the north including water quality.

Basin L

Basin L consists of vacant land in the east end of Lorson Ranch. Runoff flows east overland and drains offsite to the east. The total undeveloped flow from this 40.5acre basin is 36.9cfs/87.4cfs for the 5/100-year storm event. When this basin is developed it will be required to detain developed flows to existing amounts prior to discharging to the east including water quality.

Basin M

Basin M consists of vacant land in the southeast corner of Lorson Ranch. Runoff flows south overland and drains offsite to the south. The total undeveloped flow from this 14.4acre basin is 16cfs/38.1cfs for

the 5/100-year storm event. When this basin is developed it will be required to detain developed flow to existing amounts prior to discharging to the south including water quality.

Basin N

Basin N consists of vacant land in the southeast corner of Lorson Ranch. Runoff flows south overland and drains offsite to the south. The total undeveloped flow from this 26acre basin is 26.8cfs/64.7cfs for the 5/100-year storm event. When this basin is developed it will be required to detain developed flow to existing amounts prior to discharging to the south including water quality.

Basin OS-1

Basin OS-1 is an offsite basin consisting of Cottonwood Meadows Filing No. 1 and 2 and Marksheffel Road. This basin was studied in great detail in the FDR for Marksheffel Road 280 lot subdivision. Runoff flows east via curb/gutter and storm sewer to an existing detention pond adjacent to the FMIC Irrigation Channel. The pond discharge enters the FMIC Channel and flows east picking up additional flow from Marksheffel Road and continues east. The flow reaches the future Carriage Meadows Drive where the *stormwater is diverted from the channel into Jimmy Camp Creek via an existing diversion structure. See Design Point O1 for flow amounts.*

Basin OS-2

Basin OS-2 is an offsite basin consisting of the future Peaceful Ridge subdivision and Marksheffel Road. This basin was studied in great detail in the FDR for Peaceful Ridge at Fountain Valley subdivision prepared by Kiowa Engineering. Runoff flows east via curb/gutter and storm sewer to a proposed detention pond adjacent to Marksheffel Road. The pond discharge enters the Marksheffel Road ditch and flows east under the road and enters Carriage Meadows on Lorson Ranch. Carriage Meadows is required to convey the flow east to Jimmy Camp Creek. See Design Point O2 and O3 for flow amounts.

Basin P

Basin P consists of vacant land west of Jimmy Camp Creek. Runoff flows south overland and drains to Jimmy Camp Creek. The total undeveloped flow from this 87.3acre basin is 55.1cfs/130.6cfs for the 5/100-year storm event. When this basin is developed it will be required to detain developed flow to existing amounts prior to discharging to Jimmy Camp Creek including water quality.

Basin Q

Basin Q consists of vacant land in the southwest corner of Lorson Ranch. Runoff flows southwest overland and drains offsite to the south. The total undeveloped flow from this 27.1acre basin is 16.5cfs/39.2cfs for the 5/100-year storm event. When this basin is developed it will be required to detain developed flow to existing amounts prior to discharging to the south including water quality.

4. Drainage Facility Design

4.A. General Concept

The Jimmy Camp Creek Drainage Planning Study by Kiowa Engineering evaluated sub-regional detention and full spectrum detention ponds within the DBPS boundaries and concluded that the full spectrum detention pond alternative was more feasible. El Paso County is currently going through the process of adopting the full spectrum detention which should be approved by the board in January 27, 2015. Future detention ponds in Lorson Ranch should implement full spectrum detention ponds which will restrict developed runoff to existing runoff rates flowing into Jimmy Camp Creek and the East Tributary. The middle portions of Lorson Ranch have already been constructed using conventional detention ponds which will be allowed to remain as constructed with no modifications including Carriage Meadows. Water quality Best Management Practices (BMP's) will be implemented at the time of development.

The general drainage concept for the proposed Lorson Ranch subdivision is to direct storm water runoff utilizing swales, curb and gutter and storm sewer to detention ponds that discharge either to Jimmy Camp Creek or to its East Tributary. Offsite flows enters the project site as shown on the Offsite Basin Map in Appendix D. Any tributary offsite flow will be routed through the Lorson Ranch property to their respective drainageways in properly designed swales, channels, storm sewer, or sheet flow as the drainage and site design progresses beyond the Sketch Plan level.

Runoff that is not tributary to these two drainageways will be maintained at historic levels using detention ponds to regulate flows. The existing Fontaine Boulevard currently crosses Jimmy Camp Creek via a bridge. Fontaine Boulevard will cross the East Tributary via box culverts. All runoff from Jimmy Camp Creek and its East Tributary 100 year events will flow under these drainage structures. Jimmy Camp Creek has been channelized through Lorson Ranch and the followup LOMR has been approved by FEMA. The East Tributary has been partially channelized and a LOMR has been approved by FEMA. The remaining portions of the East Tributary will remain but may require selective channel armoring on the outside bends which will be studied in future drainage reports as the adjacent subdivisions are developed.

4.B. Specific Details

Several on-site and off-site drainage basins have been identified as shown on the Drainage Plan in the back cover of this report. Offsite basins are shown on the map in an exhibit located in Appendix D. Runoff calculations are included in the Appendix. The appendix also contains the Future Land Use Maps for the area, which was utilized to determine runoff coefficients for developed flows.

The runoff calculations and design points for the on-site basins do not include the baseflow in Jimmy Camp Creek or the East Tributary. The existing runoff is calculated for on-site drainage areas at design points which have been strategically placed where proposed detention ponds will be located. This will allow the ponds to be sized to discharge developed runoff at existing rates.

The calculated existing flows from the JCC DBPS have been included in this report and are taken directly from the Kiowa Engineering DBPS for JCC. By limiting each on-site design point to existing rates the flow in JCC should remain the same throughout development of Lorson Ranch.

Design Point A1

Design Point A1 is located on Jimmy Camp Creek and is the discharge point for Pond A1. Tributary areas for this pond are fully developed and the pond does not need to be modified in the future. The total discharge at this design point is 47.5cfs/110.6cfs for the 5/100-year storm event.

Design Point A2

Design Point A2 is located within Ponderosa Filing No. 1 and is the discharge point for Pond A2. Tributary areas for this pond are fully developed and the pond does not need to be modified in the future. The total discharge at this design point is 15.8cfs/45.6cfs for the 5/100-year storm event.

Design Point A3

Design Point A3 is located within Ponderosa Filing No. 1 on a vacant lot and is the discharge point for a future Pond A3. Tributary areas for this pond are almost fully developed and the pond will not need to be full spectrum when it is built. The total discharge at this design point is 12.0cfs/43.6cfs for the 5/100-year storm event.

Design Point A4

Design Point A4 is located within Pioneer Landing Filing No. 1 and is the discharge point for Pond A4. Tributary areas for this pond are fully developed and the pond is constructed for the developed area. The total discharge at this design point is 3.3cfs/22cfs for the 5/100-year storm event.

Design Point A5

Design Point A5 is located within Buffalo Crossing and is the discharge point for Pond A5. Tributary areas for this pond are fully developed and the pond is constructed for the developed area. The total discharge at this design point is 9.5cfs/75cfs for the 5/100-year storm event.

Design Point B1

Design Point B1 is located within the future Pioneer Landing Filing No. 2 and is the discharge point for existing Pond B1. Tributary areas for this pond are assumed to be fully developed and the pond should be constructed for the developed area. It is possible to retrofit this pond to be full spectrum. There is an existing pond in this location but the bottom and outlet structure will need to be modified when Pioneer Landing 2 is developed. The total discharge at this design point is 4cfs/9cfs for the 5/100-year storm event.

Design Point B2

Design Point B2 is located within Meadows Filing No. 3 and is the discharge point for existing Pond B2. Tributary areas for this pond are fully developed and the pond has been constructed for the developed area. The total discharge at this design point is 9cfs/27.2cfs for the 5/100-year storm event.

Design Point C1

Design Point C1 is located south of Meadows Filing No. 4 and is the discharge point for existing Pond C1. Tributary areas for this pond are almost fully developed and the pond has been constructed for the developed area. The total discharge at this design point is 19.5cfs/75.5cfs for the 5/100-year storm event.

Design Point C3

Design Point C3 is located within Meadows Filing No. 4 and is the discharge point for existing Pond C3. Tributary areas for this pond are to be fully developed and the pond will be constructed for the developed area. The total discharge at this design point is 3cfs/28.2cfs for the 5/100-year storm event.

Design Point D1

Design Point D1 is located within Carriage Meadows and is the discharge point for Pond D1. Tributary areas for this pond are to be fully developed and the pond will be constructed for the developed area. Full spectrum will not be implemented in this pond due to the limited area available. The total discharge at this design point is 17.3cfs/28.4cfs for the 5/100-year storm event.

Design Point O1

Design Point O1 is located within Carriage Meadows and is in the FMIC irrigation channel. Tributary areas for this pond are fully developed and include base flows from the FMIC irrigation channel as outlined in the FDR for the 280 Lot intersection Plan for Marksheffel Road. The total discharge at this design point is 113cfs/214cfs for the 5/100-year storm event. The storm runoff is diverted from the irrigation baseflow just to the east of this design point at Carriage Meadows drive where a diversion structure is located.

Design Point O2

Design Point O2 is located within the Peaceful Ridge at Fountain Valley subdivision. Tributary areas for this pond will fully developed as outlined in the FDR for the Peaceful Ridge Subdivision. The total discharge at this design point is from the proposed pond and is 31cfs/79cfs for the 5/100-year storm event. The discharge enters an existing culvert under Marksheffel Road where Carriage Meadows will be required to convey the flow east to Jimmy Camp Creek.

Design Point O3

Design Point O3 is located within the Peaceful Ridge at Fountain Valley subdivision. Tributary areas for this pond will fully developed as outlined in the FDR for the Peaceful Ridge Subdivision. The total discharge at this design point is 41cfs/104cfs for the 5/100-year storm event. The discharge enters a

proposed culvert under Marksheffel Road (by Peaceful Ridge) where Carriage Meadows will be required to convey the flow east to Jimmy Camp Creek.

5. Conclusions

5.A. Compliance with Standards

The drainage design for the proposed Lorson Ranch residential subdivision has been performed in conformance with the *City of Colorado Springs/El Paso County Drainage Criteria Manual*, *Jimmy Camp Creek Drainage Planning Study*, and the *Urban Drainage and Flood Control District Drainage Criteria Manual*.

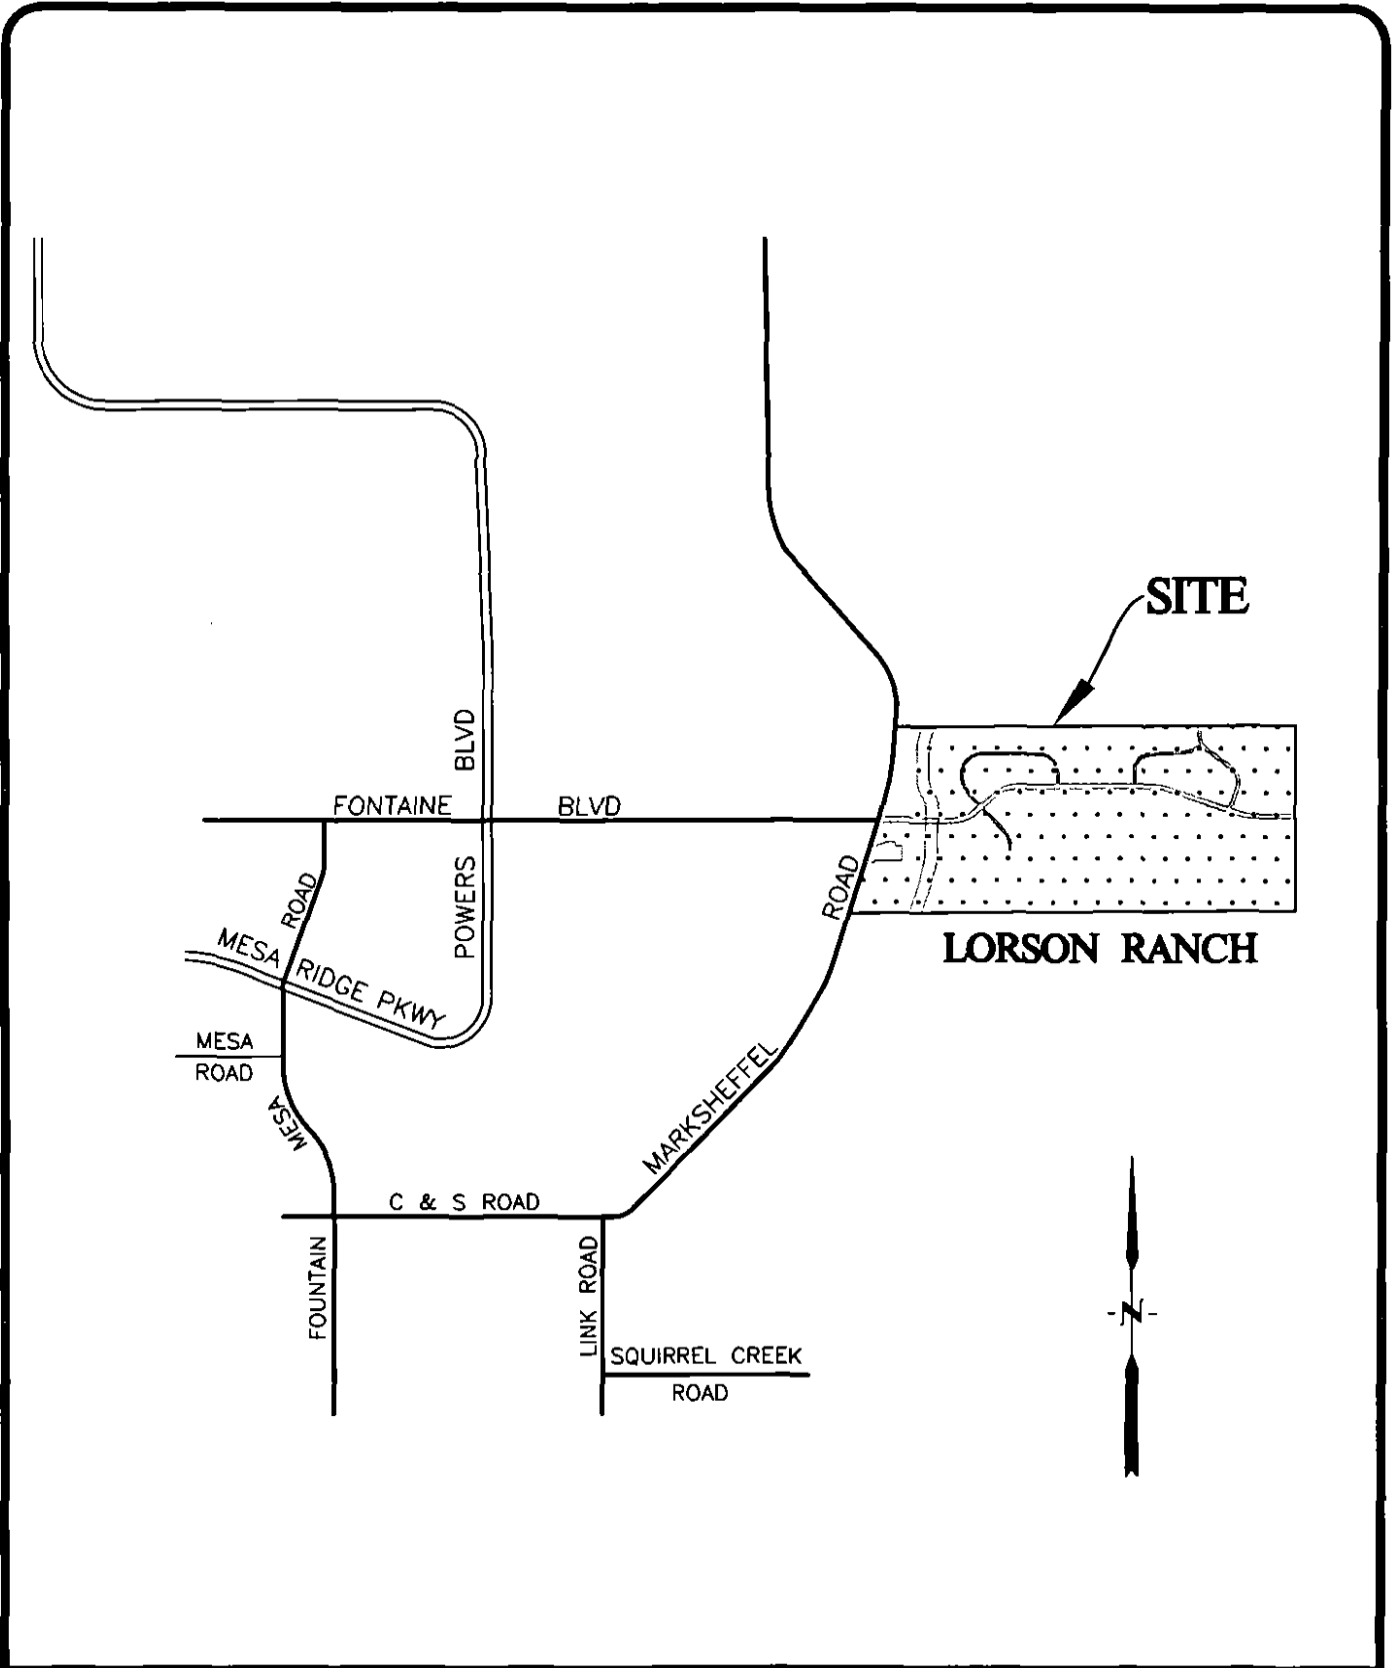

5.B. Drainage Concept

The overall design concept for the proposed residential subdivision, Lorson Ranch, will be designed to protect structures from the 100-year flood event. Existing drainage patterns will be maintained as much as possible following natural drainage corridors to the greatest extent possible. Drainage improvements will be provided to accommodate both the 5-year and 100-year storm events. A more complete, detailed analysis, including a Master Development Drainage Plan (MDDP), for this site will be submitted with the preliminary design phases for the remaining areas to be developed.
