# Final Drainage Report Terra Ridge North

Colorado Springs, Colorado 80908

Prepared for: El Paso County, CO

On Behalf of: Phillip S. and Jennifer Miles PO Box 88461 Colorado Springs, CO 80908 719-352-8886

Prepared by: Lodestar Engineering, LLC PO Box 88461 Colorado Springs, CO 80908 Phillip Shay Miles, PE 719-352-8886

> September 10, 2022 PCD File #XXXXX:

#### **ENGINEER'S STATEMENT:**

The attached drainage plan and report were prepared under my direction and supervision and are correct to the best of my knowledge and belief. Said drainage report has been prepared according to the criteria established by the County for drainage reports and said report is in conformity with the master plan of the drainage basin. I accept responsibility for any liability caused by any negligent acts, errors, or omissions on my part in preparing this report.

Signature: Date:

Phillip Shay Miles, PE Registered Professional Engineer State of Colorado No.40462

#### **DEVELOPER'S STATEMENT:**

I, the owner/developer, have read and will comply with all of the requirements specified in this drainage report and plan.

Name of Owner/Developer: Phillip S. Miles

Authorized Signature: \_\_\_\_\_\_Date: \_\_\_\_\_

Title: Owner

Address: 15630 Fox Creek Lane, Colorado Springs, CO 80908

#### **EL PASO COUNTY:**

Filed in accordance with the requirements of the Drainage Criteria Manual, Volumes 1 and 2, El Paso County Engineering Criteria Manual and Land Development Code as amended.

County Engineer / ECM Administrator

# Custom Soil Resource Report for El Paso County Area, Colorado

fox creek subdivision

# Preface

Soil surveys contain information that affects land use planning in survey areas. They highlight soil limitations that affect various land uses and provide information about the properties of the soils in the survey areas. Soil surveys are designed for many different users, including farmers, ranchers, foresters, agronomists, urban planners, community officials, engineers, developers, builders, and home buyers. Also, conservationists, teachers, students, and specialists in recreation, waste disposal, and pollution control can use the surveys to help them understand, protect, or enhance the environment.

Various land use regulations of Federal, State, and local governments may impose special restrictions on land use or land treatment. Soil surveys identify soil properties that are used in making various land use or land treatment decisions. The information is intended to help the land users identify and reduce the effects of soil limitations on various land uses. The landowner or user is responsible for identifying and complying with existing laws and regulations.

Although soil survey information can be used for general farm, local, and wider area planning, onsite investigation is needed to supplement this information in some cases. Examples include soil quality assessments (http://www.nrcs.usda.gov/wps/portal/nrcs/main/soils/health/) and certain conservation and engineering applications. For more detailed information, contact your local USDA Service Center (https://offices.sc.egov.usda.gov/locator/app?agency=nrcs) or your NRCS State Soil Scientist (http://www.nrcs.usda.gov/wps/portal/nrcs/detail/soils/contactus/? cid=nrcs142p2\_053951).

Great differences in soil properties can occur within short distances. Some soils are seasonally wet or subject to flooding. Some are too unstable to be used as a foundation for buildings or roads. Clayey or wet soils are poorly suited to use as septic tank absorption fields. A high water table makes a soil poorly suited to basements or underground installations.

The National Cooperative Soil Survey is a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local agencies. The Natural Resources Conservation Service (NRCS) has leadership for the Federal part of the National Cooperative Soil Survey.

Information about soils is updated periodically. Updated information is available through the NRCS Web Soil Survey, the site for official soil survey information.

The U.S. Department of Agriculture (USDA) prohibits discrimination in all its programs and activities on the basis of race, color, national origin, age, disability, and where applicable, sex, marital status, familial status, parental status, religion, sexual orientation, genetic information, political beliefs, reprisal, or because all or a part of an individual's income is derived from any public assistance program. (Not all prohibited bases apply to all programs.) Persons with disabilities who require

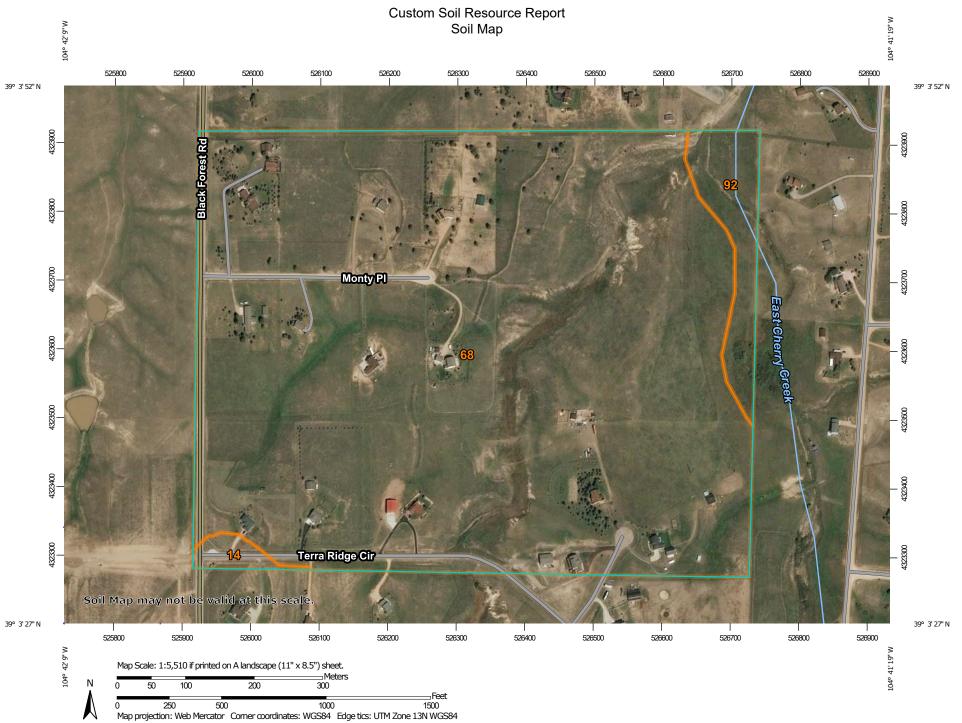

alternative means for communication of program information (Braille, large print, audiotape, etc.) should contact USDA's TARGET Center at (202) 720-2600 (voice and TDD). To file a complaint of discrimination, write to USDA, Director, Office of Civil Rights, 1400 Independence Avenue, S.W., Washington, D.C. 20250-9410 or call (800) 795-3272 (voice) or (202) 720-6382 (TDD). USDA is an equal opportunity provider and employer.

# Soil Map

The soil map section includes the soil map for the defined area of interest, a list of soil map units on the map and extent of each map unit, and cartographic symbols displayed on the map. Also presented are various metadata about data used to produce the map, and a description of each soil map unit.

# Map Unit Descriptions

The map units delineated on the detailed soil maps in a soil survey represent the soils or miscellaneous areas in the survey area. The map unit descriptions, along with the maps, can be used to determine the composition and properties of a unit.

A map unit delineation on a soil map represents an area dominated by one or more major kinds of soil or miscellaneous areas. A map unit is identified and named according to the taxonomic classification of the dominant soils. Within a taxonomic class there are precisely defined limits for the properties of the soils. On the landscape, however, the soils are natural phenomena, and they have the characteristic variability of all natural phenomena. Thus, the range of some observed properties may extend beyond the limits defined for a taxonomic class. Areas of soils of a single taxonomic class rarely, if ever, can be mapped without including areas of other taxonomic classes. Consequently, every map unit is made up of the soils or miscellaneous areas for which it is named and some minor components that belong to taxonomic classes other than those of the major soils.

Most minor soils have properties similar to those of the dominant soil or soils in the map unit, and thus they do not affect use and management. These are called noncontrasting, or similar, components. They may or may not be mentioned in a particular map unit description. Other minor components, however, have properties and behavioral characteristics divergent enough to affect use or to require different management. These are called contrasting, or dissimilar, components. They generally are in small areas and could not be mapped separately because of the scale used. Some small areas of strongly contrasting soils or miscellaneous areas are identified by a special symbol on the maps. If included in the database for a given area, the contrasting minor components are identified in the map unit descriptions along with some characteristics of each. A few areas of minor components may not have been observed, and consequently they are not mentioned in the descriptions, especially where the pattern was so complex that it was impractical to make enough observations to identify all the soils and miscellaneous areas on the landscape.

The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The objective of mapping is not to delineate pure taxonomic classes but rather to separate the landscape into landforms or

landform segments that have similar use and management requirements. The delineation of such segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, however, onsite investigation is needed to define and locate the soils and miscellaneous areas.

An identifying symbol precedes the map unit name in the map unit descriptions. Each description includes general facts about the unit and gives important soil properties and qualities.

Soils that have profiles that are almost alike make up a *soil series*. Except for differences in texture of the surface layer, all the soils of a series have major horizons that are similar in composition, thickness, and arrangement.

Soils of one series can differ in texture of the surface layer, slope, stoniness, salinity, degree of erosion, and other characteristics that affect their use. On the basis of such differences, a soil series is divided into *soil phases*. Most of the areas shown on the detailed soil maps are phases of soil series. The name of a soil phase commonly indicates a feature that affects use or management. For example, Alpha silt loam, 0 to 2 percent slopes, is a phase of the Alpha series.

Some map units are made up of two or more major soils or miscellaneous areas. These map units are complexes, associations, or undifferentiated groups.

A *complex* consists of two or more soils or miscellaneous areas in such an intricate pattern or in such small areas that they cannot be shown separately on the maps. The pattern and proportion of the soils or miscellaneous areas are somewhat similar in all areas. Alpha-Beta complex, 0 to 6 percent slopes, is an example.

An *association* is made up of two or more geographically associated soils or miscellaneous areas that are shown as one unit on the maps. Because of present or anticipated uses of the map units in the survey area, it was not considered practical or necessary to map the soils or miscellaneous areas separately. The pattern and relative proportion of the soils or miscellaneous areas are somewhat similar. Alpha-Beta association, 0 to 2 percent slopes, is an example.

An *undifferentiated group* is made up of two or more soils or miscellaneous areas that could be mapped individually but are mapped as one unit because similar interpretations can be made for use and management. The pattern and proportion of the soils or miscellaneous areas in a mapped area are not uniform. An area can be made up of only one of the major soils or miscellaneous areas, or it can be made up of all of them. Alpha and Beta soils, 0 to 2 percent slopes, is an example.

Some surveys include *miscellaneous areas*. Such areas have little or no soil material and support little or no vegetation. Rock outcrop is an example.

# El Paso County Area, Colorado

#### 14—Brussett loam, 1 to 3 percent slopes

#### Map Unit Setting

National map unit symbol: 367j Elevation: 7,200 to 7,500 feet Frost-free period: 115 to 125 days Farmland classification: Prime farmland if irrigated

#### Map Unit Composition

*Brussett and similar soils:* 85 percent *Estimates are based on observations, descriptions, and transects of the mapunit.* 

#### **Description of Brussett**

#### Setting

Landform: Flats Landform position (three-dimensional): Talf Down-slope shape: Linear Across-slope shape: Linear Parent material: Eolian deposits

#### **Typical profile**

A - 0 to 8 inches: loam BA - 8 to 12 inches: loam Bt - 12 to 26 inches: clay loam Bk - 26 to 60 inches: silt loam

#### **Properties and qualities**

Slope: 1 to 3 percent
Depth to restrictive feature: More than 80 inches
Natural drainage class: Well drained
Runoff class: Low
Capacity of the most limiting layer to transmit water (Ksat): Moderately high (0.20 to 0.60 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Calcium carbonate, maximum in profile: 5 percent
Salinity, maximum in profile: Nonsaline to very slightly saline (0.0 to 2.0 mmhos/cm)
Available water storage in profile: High (about 9.1 inches)

# National Flood Hazard Layer FIRMette

### Legend

Appendix B Calculations

# 1. Purpose

The purpose of this Final Drainage Report for Terra Ridge North is to quantify and evaluate the impacts of stormwater runoff generated by this Project and to provide adequate water quality/detention treatment.

# 2. General Description

The Terra Ridge North property (Project) is a 39.72-acre single-family development consisting of 11 lots and a public street (Fox Creek Lane) located within Black Forest, Colorado in El Paso County. The project will consist of a public street, detention pond, and new home construction and associated site elements typical of single-family residential development (e.g. – driveways, patios, landscaping, etc.). The property is bounded by Ridgeview Acres to the north, Whispering Hills Estates to the west Wildwood Village to the east, and Terra Ridge Estates to the south. All lots surrounding the subject property are all zoned RR-5. The entire 39.72-acre parcel lies within unincorporated El Paso County and is currently zoned RR-2.5.

This project is located in the Town of Black Forest, El Paso County, Colorado. Access to the site is from Fox Creek Lane. It is located in Section 29, Township 11 south, Range 65 west of the 6<sup>th</sup> principal meridian. A vicinity map is provided below in Figure 1.

Figure 1 – Vicinity Map

The existing site is covered with native grasses with a few randomly located ponderosa pines. The topography of the site is rolling hills with two drainage ways extending from south to north through the property. A 100-foot-wide electric easement extends north to south along the eastern portion of the site.

# 3. Soils Conditions

The proposed development is 39.72 acres. Ground cover primarily consists of existing vegetation primarily consisting of native grass and shrubs.

The general topography of the land slopes to the south at slopes in the range of 2% to 30%. According to the Natural Resources Conservation Service (NRCS), the soils in this area consist of Peyton-Pring Complex and Tomah-Crowfoot loamy sands, and can be classified as a Hydrologic Soil Group (HSG) Types B. A soil map and map unit (soils type) descriptions describing the HSG and other soils properties are provided in Appendix A. For the purposes of this report an HSG type B soil has been used to define rational method runoff coefficients.

Generally speaking, stormwater runoff from this project flows to the north and will initially enter an unnamed drainageway which ultimately discharges into East Cherry Creek.

# 4. Drainage Criteria

The hydrologic and hydraulic analysis performed in this report utilizes The City of Colorado Springs and El Paso County Drainage Criteria Manual (Vol 1, 1991) (Vol 2, 2002), The City of Colorado Springs (Chpt. 6, 2014, and the MHFD USDCM (Urban Storm Drainage Criteria Manual) Volumes 1 & 2. Stormwater runoff was determined using the Rational Method and was calculated for existing and proposed conditions for the 5-yr (minor) and 100-yr (major) recurrences. 1-hour rainfall depths were derived from NOAA Atlas 14, Volume 8, Version 2 specific to the Project location.

The following MHFD hydrologic and hydraulic software were used in this report:

- UD-Culvert v3.05 –Culvert and Erosion Protection Calculations
- MHFD-Detention v4.03 Water Quality and Detention Calculations

# 5. Existing and Proposed Drainage Conditions

# 5.1 Drainage Patterns and Hydraulic Routing

# Existing

Stormwater runoff from this Project generally flows to the north and will initially enter an unnamed tributary ultimately discharging to East Cherry Creek. The imperviousness value of undeveloped land is  $\sim 2\%$  in accordance with DCM Table 6-6.

Design Point EX flows are generated from a naturally vegetated field in combination with the developed flows from the existing Terra Ridge subdivision. The  $Q_{100}$  flow is 433.2cfs.

#### Proposed

Proposed roadway construction and associated grading will create five (5) on-site basins and two (2) off-site basins. Refer to the drainage plan in Appendix C.

Design Point 1 flows are generated from basin B. Basin B consists of public roadway improvements to include pavement, and roadside ditches. Unconcentrated sheet flow across the pavement is collected in the adjacent ditch and is routed north to the proposed 18" storm culvert. At this location, runoff will be conveyed under the proposed roadway to the ditch on the east side. Runoff is then conveyed under the proposed maintenance access road via a 24" storm culvert with flow ultimately discharging into the proposed water quality/detention pond facility.

Design Point 2 flows are generated from basins A and B. Basin A consists of public roadway improvements to include pavement, and roadside ditches. Unconcentrated sheet flow across the pavement is collected in the adjacent ditch and combines with basin B runoff and is routed north to design point 2. At this location, runoff will be conveyed in a riprap rundown channel to the forebay of the proposed water quality/detention pond facility. Riprap will be provided with a d50 of 9" and a thickness of 18" to prevent erosion prior to entering the concrete forebay. The proposed forebay will be ~80cf in volume. Flows into a 1.5' wide concrete trickle channel will be conveyed to the outlet structure micropool. Refer to the forebay and detention pond calculations located in Appendix B. The emergency overflow route is over a 4' wide proposed spillway which has been designed to pass the peak flow from the 100yr flow event.

Drainage map DP2 shows this as 369cfs. Also clarify that this is for the 100yr event.

Design Point 3: The JR report shows flows entering the project site with a value of 366cfs (JR DP5). To route this flow to Fox Creek Design Point 3, this flow value (366cfs) and the time of concentration (Tc) for Design Point 5 from the JR report (0.765hrs = 45.9minutes) was held and a corresponding CA equivalent (rational method input) was calculated for routing to Design Point 4. The Tc for the JR flow (45.9) was added to the additional Tc (9.2 minutes) to route thru the site to Design Point 4, yielding a higher Tc (55.1) for Design Point 5 report data and the 371 tributary acres with a resultant flow of 366cfs yields ~1.01cfs/acre. Our addition of off-site basin OS1 and onsite basin D (total 45acres) yielded a peak flow at Design Point 4 of 431.8cfs. Therefore, our project site had flows of ~0.96cfs/acre which is close to the 1.01cfs/acre value determined by JR.

Design Point 4 flows are generated from off-site basins OS1 and OS2, Design Point 3 as well as on-site basin D. Basin OS1 and OS2 consist of large lot single family subdivision development improvements with homes, driveways, sheds, and various outbuildings. Runoff flows down the side slope and directly into the adjacent drainageway. Basin D consists of a naturally vegetated field which will have some minor impervious area additions from the proposed home sites. Runoff from basin D is routed directly into the drainageway and then to the north to design point 4. To enable the flows at this location to pass under the proposed driveway, three 48" culverts are proposed. Energy dissipation will be provided at the outfall to minimize the potential for erosion/local scour.

> Also discuss the areas of soil disturbance (discussed in my comment on DP2 map) in Basin D that are not tributary to the pond. Discuss how WQ treatment will be provided for those areas and/or which exclusion(s) apply. State the excluded acreage.

Basin E flows are generated from a naturally vegetated field and a short segment of driveway pavement. This basin runoff is not being treated in the proposed water quality/detention pond because of the topographical constraints on site. Basin E flows are routed in the existing drainageway to the northeast combining with another drainageway to the east near the northeastern lot corner.

Basin F flows are generated from a naturally vegetated field which will have home site construction. Basin E flows are routed in an existing drainageway on the east side of the property which combines with the aforementioned drainageway within basin E near the northeastern lot corner.

Basic C is not used.

Discuss WQ treatment exclusions for this basin: Excluded per ECM Appendix I.7.1.B.5 for Large Lot Single Family Sites.

Basins D, E & F are excluded from permanent water quality per ECM Appendix I Section I.7.1.B.5 since these contain large lot single family sites (greater than 2.5 ac) and will expected soil and vegetation conditions which are suitable for infiltration/filtration.

Design Point 5 is the ultimate outflow outfall located at the northeast corner of the subdivision and is a combination of flows from DP4, basin E, and the pond outfall. The  $Q_{100}$  flow is 445.6cfs.

The developed 100-year flow at design point 5 is 12.4cfs higher than the historic 100-year flow at the same location (445.6 and 433.2 respectively). This yields only a 2.9% increase in flows from the proposed subdivision which is negligible and will not negatively impact downstream properties. In the Proposed Drainage section above, also add a

In the Proposed Drainage section above, also add a paragraph or two for the proposed roadway improvements for this project (Fox Creek Lane) that are South of this project (Terra Ridge North) in Terra Ridge F1.

# 5.2 Site Improvements

Utilities that exist within the project area are overhead electric lines running north to south across the east half of the project. There are no other known public utilities in the area. The existing electric lines are contained within an easement.

# 5.3 Hydraulic Calculations

# Culverts

The calculations for the 18" culvert and 24" culvert which routes ditch flows from basin B to basin A under the proposed driveway and under the proposed maintenance access road were performed using 2022 Civil3D design software and are contained in Appendix B. The double 48" storm culverts routing the drainageway under the proposed driveway are also contained in Appendix B.

# Ditch Capacities

The hydraulic analysis for the Fox Creek Lane roadway ditches was performed using 2022 Civil3D design software and are contained in Appendix B.

### 5.4 On-site Detention Requirements

A full spectrum water quality/detention pond is proposed for this site to provide water quality for developed flows as a result of this development. In addition to water quality, detention is

provided in the pond design. Refer to section 7 in this report for additional information regarding water quality capture volume (WQCV) and detention (peak flow attenuation) flow requirements for this project.

The Terra Ridge North HOA will own and maintain the water quality/detention pond.

### 5.5 Compliance with Other Studies

The only studies related to this project are the Terra Ridge Filing No 1 and 2 reports (see references). The basins that are common to this project (Terra Ridge – basin 12 and 17) have only been modified slightly to account for the proposed roadway construction. Flows as determined in the Terra Ridge reports for the natural drainageway have been used and supplemented with the additional flows from the Terra Ridge North watershed to determine the on-site flow at the proposed driveway crossing.

### 5.6 Four Step Process

#### Step 1 – Runoff Reduction Practices

This development address Low Impact Development strategies primarily through the utilization of roadway ditches. Runoff from the pavement sheet flows across the grass lined ditch side slopes which provides some level of water quality treatment.

#### Step 2 - Stabilize Drainageways

Portions of the existing conditions runoff currently enter the on-site natural drainageway via overland flow across the vacant lots and via the proposed full-spectrum detention pond. Due to the minor anticipated extent of land disturbance and improvements on these large lots coupled with on-site detention; the amount of runoff entering the drainageways remains basically the same. Predevelopment levels of release of the Excess Urban Runoff Volume (EURV) help the drainageway maintain its current morphology by mimicking the natural historic runoff rates over a longer period by peak flow attenuation.

<u>Step 3 –Implement BMPs that Provide a Water Quality Capture Volume with Slow Release</u> On-site flow is directed to the on-site private proposed full-spectrum detention/water quality facility. The extended detention basin provides Water Quality Capture Volume (WQCV) required for this site and attenuates the peak flows releasing them at approximate historic runoff rates over a longer period by releasing Excess Urban Runoff Volume (EURV).

#### <u>Step 4 – Consider Need for Industrial and Commercial BMPs</u> No industrial and commercial development exist onsite.

### 6. Water Quality

Stormwater that is generated from this Project is either discharged offsite in the form of unconcentrated sheet flow or is collected in roadside ditches and routed thru the proposed water quality/detention facility outfalling via an 18" storm sewer pipe.

The proposed on-site imperviousness of the area contributing to the pond is 25.9%. Basin C is not used in this report.

The proposed full spectrum extended detention basin (EDB) has been analyzed in this study based on the proposed site conditions as shown on the Drainage Plan. The pond facility provides 0.060 acre-ft of water quality capture volume, 0.137 acre-ft of excess urban runoff volume and 0.235 acre-ft of detention storage. The proposed EDB will release a peak flow 5.6cfs during the 100-year storm event. Outflows from the proposed EDB are released via a proposed 18" storm sewer pipe with a restrictor plate located within the outlet structure box. The outlet structure will have an orifice plate designed to drain the EURV over a period of 72 hours. The orifice plate will have 3 rows of holes. The lowest will be 15/16" in diameter, and the second and third rows will be 7/16" in diameter. The EDB will have a rip rap emergency overflow spillway that will drain the 100yr peak flows (7.8cfs) in the event the outlet structure becomes entirely clogged or the pond is already full. The spillway will be constructed of rip rap with a  $d50 = 9^{\circ}$ , 18" thick, a crest length of 4.0' with 3:1 side slopes. Flow depth over the crest of the spillway during the 100yr event storm will be 0.60' with 1.0' of freeboard. The outfall pipe will need to have a 3'x5' riprap pad (see appendix B calculations) downstream which necessitates the extension of spillway a distance of 5' to the north. A 10ft maintenance road has been provided extending from the private driveway to the bottom of the pond. The pond will be maintained using a skid loader. Refer to the design calculations in Appendix B for additional information.

### 7. Erosion Control Plan

see comments on CDs about pond access road criteria.

Pre-development grading is requested with the preliminary plan application and a predevelopment GEC and SWMP has been submitted separately as a stand-alone construction drawing. Refer to plans titled Terra Ridge North – Grading, Erosion and Stormwater Quality Control Plans, prepared by Lodestar Engineering, dated September 2022.

### 8. Floodplain Statement

According to the Federal Emergency Management Agency (FEMA) Flood Insurance Rate Map (FIRM) numbers 08041C0305G and 08041C0315G dated December 7, 2018 this project is <u>not</u> located within a FEMA designated 100yr floodplain. Therefore, no map revisions will be necessary as a result of this project. A copy of the FIRM maps is provided in Appendix A.

# 9. Drainage and Bridge Fees

The drainage basin is located within the East Cherry Creek Drainage Basin.

The project is not located within a fee (drainage) basin and bridge fees are not required. Therefore, no drainage or bridge fees are required for this development.

Item	Unit	Quantity	Unit Price	Extended Cost
18" Storm Pipe	LF	40	\$65	\$2,600
24" Storm Pipe	LF	20	\$75	\$1,500
48" Storm Pipe	LF	150	\$120	\$18,000
Outlet Structure	EA	1	\$10,000	\$10,000

### **10. Construction Cost Opinion**

Forebay	EA	1	\$5,000	\$5,000
Trickle Channel	Frickle Channel   LS		\$2,500	\$2,500
			Sub-total	\$39,600
			Contingency 10%	\$3,960
			TOTAL	\$43,560

All storm system elements for this project are private and therefore there will be no reimbursement from El Paso County.

### 11. Summary

The Final Drainage Report for Terra Ridge North was prepared using the El Paso County Engineering Criteria Manual, City of Colorado Springs Drainage Criteria Manuals, and Mile High Flood Control District Manuals. Stormwater quality and detention is provided by a proposed facility located on-site. No adverse downstream impacts are anticipated as a result of the proposed site improvements.
