# FINAL DRAINAGE REPORT for LATIGO TRAILS FILING No. 10 & ADDENDUM TO MDDP/PRELIMINARY PLAN LATIGO TRAILS

El Paso County, Colorado

#### 1.0 CERTIFICATION STATEMENTS

#### **ENGINEER'S STATEMENT**

Tim D. McConnell, P.E.

The attached drainage plan and report were prepared under my direction and supervision and are correct to the best of my knowledge and belief. Said drainage report has been prepared according to the criteria established by El Paso County for drainage reports, and said report is in conformity with the master plan of the drainage basin. I accept responsibility for any liability caused by any negligent acts, errors or omission on my part in preparing this report.

Date

	Behalf of Drexel, Barrell & Co.	
<u>DEVELOPER</u>	R'S STATEMENT	
	loper have read and will comply witeport and plan.	h all the requirements specified in this

# FINAL DRAINAGE REPORT for LATIGO TRAILS FILING No. 10 & ADDENDUM TO MDDP/PRELIMINARY PLAN LATIGO TRAILS

El Paso County, Colorado

#### 2.0 PURPOSE

This report is prepared by Drexel, Barrel & Co in support of the Latigo Trails Filing No. 10 project. The purpose of this report is to identify onsite and offsite drainage patterns, size drainage facilities and to safely route developed storm water runoff to adequate outfall facilities.

#### 3.0 GENERAL SITE DESCRIPTION

#### Location

The Latigo Trails Development is located within portions of Sections 8,9,16 & 17, Township 12 South, Range 64 West of the 6<sup>th</sup> Principal Meridian, El Paso County, Colorado. Latigo Trails Filing 10 is bound by Latigo Trails Filing 9 to the west, Latigo Trails Filings 11 & 12 to the north, unplatted land to the east and Falcon Regional Park to the south. A vicinity map is presented in the appendix.

#### **Existing Site Conditions**

The overall Latigo Trails Development contains approximately 497 acres and at full build-out will be comprised of 179, 2.5-acre or larger lots. Latigo Trails Filing 10 consists of 125.6 acres and covers 43 proposed lots. Filing No. 10 is currently undeveloped, with open grassland and sparse vegetation covering the ground. Latigo Trails Filings 2, 7, 8 & 9 are currently developed and as studied as part of the 2001 MDDP for Latigo Trails by URS and amended by subsequent drainage reports, will remain unchanged.

The Latigo Trails subdivision as a whole, is split by a major drainage basin boundary. In the ultimate full-build out condition approximately 263 acres will drain to the Gieck Ranch basin, while the remaining 234 acres will drain to the Upper Black Squirrel basin. In general, the Upper Black Squirrel basin drains from southwest to northeast across the site, while the Gieck Ranch basin flows from northwest to southeast. Latigo Trails Filing 10 sits at the southeast corner of the overall development, almost entirely within the Gieck Ranch Basin.

#### Soils

According to the Soil Survey of El Paso County Area, Colorado, prepared by the U.S. Department of Agriculture Soil Conservation Service, the site is entirely underlain by Stapleton Sandy Loam (Soil No. 83). This soil is type 'B' hydrological soil group. See appendix for map.

#### Floodplain Statement

According to the Federal Emergency Management Agency (FEMA) Flood Insurance Rate Map (FIRM) Panels 08041C0339G and 08041C0552G (December 7, 2018), no portion of Filing 10 lies within a designated 100-year floodplain.

#### 4.0 MAJOR DRAINAGE BASINS & APPROVED REPORTS

As mentioned above, the subdivision as a whole lies within two major drainage basins: the Gieck Ranch Drainage Basin and the Upper Black Squirrel Drainage basins. A Master Development Drainage Plan (MDDP) was approved for Latigo Trails and is titled "Master Development/Preliminary Drainage Plan for Latigo Trails," by URS, dated October 2001; it is referenced and used as a Master Plan for the project.

The following reports have also been reviewed and referenced for the preparation of this report:

"Final Drainage Report for The Trails Filing No. 7 Subdivision," by URS, dated March 07, 2005.

"Final Drainage Report for Latigo Trails Filing No. 9 and Addendum to Master Development/Preliminary Drainage Plan," by JR Engineering, March 29, 2023.

Excerpts from referenced reports are presented in the appendix.

#### 5.0 ADDENDUM TO MDDP/PRELIMINARY DRAINAGE PLAN

For Latigo Trails Filing No. 10, The Master Development/Preliminary Drainage Plan for Latigo Trails, by URS will be amended as follows:

- 1. The potential detention areas shown in the MDDP on the north side of Conestoga Trail are eliminated and instead flows are to be conveyed via roadside ditch and cross culverts to the proposed detention basin G14b (Location corresponds with MDDP Design Point G14b).
- 2. Proposed detention facilities G14b, G18 and G19 have been sized to meet current El Paso County Drainage Criteria. The existing South Pond sizing was established by the Filing 9 FDR/MDD Amendment and has been analyzed to confirm no modifications are necessary as part of this Filing 10 development.

#### 6.0 MAJOR BASIN IMPROVEMENTS

#### Gieck Ranch Drainage Basin

This report proposes that the drainage system for Filing 10 will be compromised of swales, culverts, and detention ponds. The proposed drainage design is in conformance with the approved "Master Development/Preliminary Drainage Plan for Latigo Trails" report as runoff flows within the Gieck Ranch Basin generally follow the historic drainage pattern to the south and east.

#### **Upper Black Squirrel Basin**

A small portion of Filing 10 is currently located within the Upper Black Squirrel Basin. Flows from Basin A28 (NW corner of Lot 43) will follow the historic drainage pattern and discharge to the northwest into future Filing 11 and or 12. This area will be analyzed as an offsite basin in the design for Filings 11 and 12, with flows likely routed to the proposed Black Squirrel pond at the northeast corner of the Latigo Trails subdivision.

#### 7.0 DRAINAGE CRITERIA

The drainage analysis has been prepared in accordance with the current El Paso County Drainage Criteria Manual and the current Mile High Flood District Drainage Criteria Manual. Calculations were performed to determine runoff quantities during the 5-year and 100-year frequency storms for historic and developed conditions utilizing the Rational Method.

Mile High Flood District's UD-Detention, Version 4.06 workbook was used for pond sizing, with required detention volumes and allowable release rates designed per El Paso County criteria. Pond sizing spreadsheets are presented in the appendix.

The Federal Highway Administration's HY-8 program (Volume 8) was used to analyze the proposed culverts within the Latigo Trails development. Major cross culverts were sized as to not overtop the road in the 100 year storm event, driveway culverts were sized as to not exceed 6" overtopping of the driveway during the 100-year storm event. Culvert design sheets are presented in the appendix.

Autodesk Inc.'s Hydraflow Express Extension (Volume 10.5) was used for roadside ditch and conveyance ditch design. For the purposes of this FDR/MDDP, the maximum roadside ditch size was determined based on peak 100-year flows and maximum roadway slopes within each basin. Swales were checked for velocity per the EPC DCM Chapter 10, Table 10-4. Swale cross sections with a 100-year velocity greater than 5 ft/ will be lined with turf reinforcing mat and native grasses, or another approved method of stabilization, to limit erosive potential. Swale design sheets are presented in the appendix.

#### 8.0 EXISTING CONDITION

The existing project condition considers the adjacent filings in their current developed condition (2.5-acre residential subdivision). The undeveloped area is covered with native vegetation that consists mostly of grasses as well as some shrubs. The site generally slopes at approximately 1-15% to the east and to the south, where the flows leave the project site onto the adjacent properties. The site lies primarily within the Geick Ranch Drainage Basin, with a very small portion at the northwest corner lying within the Upper Black Squirrel Basin. See Existing Conditions Map in Appendix.

<u>A-group basins</u> represent flows for basins that are part of Filing 10, and offsite developed flows from adjacent filings. <u>B-group basins</u> represent offsite flows for tributary basins that are part of future Filing 12.

#### **RATIONAL METHOD RUNOFF SUMMARY**

		Area		
BASIN	DP	(Ac.)	Q <sub>5</sub> (cfs)	Q <sub>100</sub> (cfs)

**Basin OSA1** is an offsite basin covering 3.68 acres of Conestoga Trail South to the west of the project site. Flows generated by this basin ( $Q_5=3.7$  cfs and  $Q_{100}=8.0$  cfs) travel via roadside ditch to the south and east before entering Filing 10 at **Design Point DPOSA1**.

**Basin OSA2** is an offsite basin covering 92.80 acres of Filing 9 to the north of Conestoga Trail South. Flows generated by this basin ( $Q_5$ =33.1 cfs and  $Q_{100}$ =128.7 cfs) ultimately travel via roadside ditch to the south and east before entering Filing 10 at **Design Point DPOSA2** 

**Basin OSA3** is an offsite basin covering 69.15 acres of Filing 2-B to the northwest of Filing 10. Flows generated by this basin ( $Q_5=29.3$  cfs and  $Q_{100}=113.6$  cfs) travel via roadside ditch and

cross lot drainage ditch to the southeast before entering Filing 10 at **Design Point DPOSA3**. **Basin OSA4** is an offsite basin covering 32.65 acres of Filing 7-A to the northwest of Filing 10. Flows generated by this basin ( $Q_5=16.0$  cfs and  $Q_{100}=60.5$  cfs) travel via roadside ditch and cross lot drainage ditch to the southeast before entering Filing 10 at **Design Point DPOSA4**.

**Basin OSA5** is an offsite basin covering 11.33 acres of Filing 7-A to the north of Filing 10. Flows generated by this basin ( $Q_5$ =7.3 cfs and  $Q_{100}$ =28.1 cfs) travel via roadside ditch and cross lot drainage ditch to the south before entering Filing 10 at **Design Point DPOSA5**.

**Existing Basin A1** is located at the southwest corner of the site. Flows generated by this basin ( $Q_5=1.8$  cfs and  $Q_{100}=12.2$  cfs) are directed southeast to **Design Point DP1** along the southern boundary of Filing 10.

**Basin B1** is located at the northwest corner of future Filing 12. Flows generated by this basin ( $Q_5$ =0.9 cfs and  $Q_{100}$ =6.2 cfs) are directed south before entering Filing 10 at **Design Point DPB1**.

**Existing Basin A2** is located in the southwest portion of the site. Flows generated by this basin ( $Q_5$ =5.1 cfs and  $Q_{100}$ =34.4 cfs) combine with those from offsite basins OSA1-OSA5 and B1 and are directed southeast to the existing South Pond at **Design Point DP2**.

**Design Point DP2** is located at the bottom of the existing South Pond that was constructed previously and modified with the development of Filing 9. This design point represents the combining of flows of Basins OSA1-OSA5, B1 and A2.

**Basin B2** is located along the south edge of future Filing 12. Flows generated by this basin ( $Q_5=0.2$  cfs and  $Q_{100}=1.3$  cfs) are directed south before entering Filing 10 at **Design Point DPB2**.

**Existing Basin A3** is located in the southwest portion of the site, just east of Basin A2. Flows generated by this basin ( $Q_5$ =2.9 cfs and  $Q_{100}$ =19.9 cfs) combine with those from Basin B2 and are directed south to **Design Point DP3** along the southern boundary of Filing 10.

**Existing Basin A4** is located in the middle portion of the site, along the southern boundary. Flows generated by this basin ( $Q_5=1.1$  cfs and  $Q_{100}=7.6$  cfs) are directed south to **Design Point DP4**, along the south boundary of Filing 10.

**Basin B3** is located in the middle portion of the site. Flows generated by this basin ( $Q_5=1.2$  cfs and  $Q_{100}=8.4$  cfs) are directed to the south before entering Filing 10 at **Design Point DPB3**.

**Existing Basin A5** is located in the middle portion of the site. Flows generated by this basin ( $Q_5=2.6$  cfs and  $Q_{100}=17.7$  cfs) combine with flows from Basin B3 and are directed south to **Design Point DP5**, along the southern boundary.

**Existing Basin A6** is located in the middle portion of the site, along the southern boundary. Flows generated by this basin ( $Q_5=1.9$  cfs and  $Q_{100}=12.9$  cfs) are directed south to **Design Point DP6**, along the southern boundary.

**Basin B4** is located in the middle portion of the future Filing 12 site. Flows generated by this basin ( $Q_5=1.9$  cfs and  $Q_{100}=12.9$  cfs) are directed east before entering Filing 10 at **Design Point DPB4.** 

**Existing Basin A7** is located in the eastern portion of the site, along the southern boundary. Flows generated by this basin ( $Q_5$ =2.9 cfs and  $Q_{100}$ =19.3 cfs) combine with those from Basin B4 and are directed south to **Design Point DP7**, along the southern boundary.

**Existing Basin A8** is located in the southeast corner of the site, along the southern boundary. Flows generated by this basin ( $Q_5$ =0.6 cfs and  $Q_{100}$ =4.4 cfs) are directed south to **Design Point DP8**, along the southern boundary.

**Existing Basin A9** is located in the southeast corner of the site, along the eastern boundary. Flows generated by this basin ( $Q_5$ =0.6 cfs and  $Q_{100}$ =4.4 cfs) are directed east to **Design Point DP9** before discharging into the roadside ditch along Eastonville Road and continuing south.

**Existing Basin A10** is located in the middle portion of the site, along the eastern boundary. Flows generated by this basin ( $Q_5$ =1.9 cfs and  $Q_{100}$ =13.1 cfs) are directed east to **Design Point DP10** before discharging into the roadside ditch along Eastonville Road. Flows continue in the roadside ditch until ultimately reaching an existing 30"x42" HECMP cross culvert to the south.

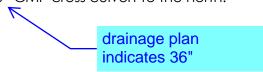

**Existing Basin A11** is located in the middle portion of the site, along the eastern boundary. Flows generated by this basin ( $Q_5$ =1.8 cfs and  $Q_{100}$ =12.2 cfs) are directed east to **Design Point DP11** before discharging into the roadside ditch along Eastonville Road. Flows continue in the roadside ditch until ultimately reaching an existing 30"x42" HECMP cross culvert to the south.

**Basin B5** is located in the middle portion of the future Filing 11 site. Flows generated by this basin ( $Q_5$ =0.5 cfs and  $Q_{100}$ =3.3 cfs) are directed east before entering Filing 10 at **Design Point DPB5**.

**Existing Basin A12** is located in the middle portion of the site, along the eastern boundary. Flows generated by this basin ( $Q_5$ =2.1 cfs and  $Q_{100}$ =14.3 cfs) combine with those from basin B5 and are directed east to **Design Point DP12** before discharging into the roadside ditch along Eastonville Road. Flows continue in the roadside ditch until ultimately reaching an existing 30"x42" HECMP cross culvert to the south.

**Basin B6** is located in the middle portion of the future Filing 11 site. Flows generated by this basin ( $Q_5=2.9$  cfs and  $Q_{100}=19.9$  cfs) are directed northeast before entering Filing 10 at **Design Point DPB6**.

**Existing Basin A13** is located in the middle portion of the site, along the eastern boundary. Flows generated by this basin ( $Q_5$ =3.4 cfs and  $Q_{100}$ =22.7 cfs) combine with those from basin 86 and are directed east to **Design Point DP13** before discharging into the roadside ditch along Eastonville Road. Flows continue in the roadside ditch ultimately reach an existing 30" CMP cross culvert to the north.

**Existing Basin A14** is located at the northeast corner of the site, along the eastern boundary. Flows generated by this basin ( $Q_5$ =2.0 cfs and  $Q_{100}$ =13.4 cfs) are directed east to **Design Point DP14** along the eastern boundary of Filing 10, before discharging into the roadside ditch along Eastonville Road. Flows ultimately reach an existing 30" CMP cross culvert to the south.

**Basin OSA6** is the offsite basin just north of Basin A14. Flows generated by this basin ( $Q_5=10.3$  cfs and  $Q_{100}=18.5$  cfs) are directed east to **Design Point DPOSA6**, along the eastern boundary of Filing 10, before discharging into the roadside ditch along Eastonville Road.

**Existing Basin A15** covers a small 0.61-acre area at the northwestern corner of Filing 10. This basin sits within the Upper Black Squirrel drainage basin. Flows generated by this basin ( $Q_5$ =0.2 cfs and  $Q_{100}$ =1.2 cfs) follow natural drainage paths to the northwest into the adjacent future Filing 12.

#### 9.0 DEVELOPED CONDITION

In the developed condition, as with the adjacent filings, the majority of the generated flows are designed to be collected in roadside ditches and conveyed to the proposed detention areas. However, basins along the south side of Conestoga Trail South and the east side of Irish Hunter Trail cover lot areas outside of the roadway, that are intended to follow historic drainage patterns to the south and east, without detention or treatment for water quality. See further discussion and applicable exclusions for these basins below.

Roadside and conveyance ditches have been designed in accordance with County criteria and sized to accommodate developed flows with 1' of freeboard above the water surface elevation. Ditches with flowrates greater than 5fps will be reinforced with SC250 Vmax TRM (Turf Reinforcement Mat), or equivalent.

Cross culverts at Conestoga Trail South and Irish Hunter Trail have been designed to not overtop the roadway during the 100-year storm event. The inlets and outlets of the proposed culverts will be protected with riprap to aid in erosion control. Future driveway culverts have been sized with an overtopping allowance of 6" during the 100-year storm event, and sizing requirements are tabulated in the appendix. Future engineered site plans for the individual lots will provide final details for the driveway locations and culverts that will be constructed by others. Detailed swale, culvert and riprap calculations, sections and TRM specifications are included in the appendix.

For the purposes of site specific analysis, the project site has been divided into several grouped drainage basins as shown on the proposed drainage plan. **A-group basins** represent flows for basins that are part of Filing 10, along with offsite basins from adjacent filings and **B-group basins** represent flows for basins that are part of future Filing 11. These basins are considered in their anticipated future developed condition for the purposes of this analysis. Development of Filing 11 will require confirmation that the actual developed condition does not adversely affect the downstream drainage design presented in this report.

#### Rational Method Runoff Summary

BASIN	DP	Area (Ac.)	Q₅ (CFS)	Q <sub>100</sub> (CFS)

**Basin OSA1** is an offsite basin covering 3.68 acres of Conestoga Trail South to the west of the project site. Flows generated by this basin ( $Q_5$ =3.6 cfs and  $Q_{100}$ =7.9 cfs) travel via roadside ditch to the south and east before entering Filing 10 at **Design Point DPOSA1**. The roadside ditch from this point is proposed as a triangular section with a minimum of 2' depth to accommodate flows and provide for 1' freeboard.

Basin OSA2 is an offsite basin covering 96.30 acres of Filing 9 to the north of Conestoga Trail

South. Flows generated by this basin ( $Q_5$ =29.4 cfs and  $Q_{100}$ =127.3 cfs) ultimately travel via roadside ditch to the south and east before entering Filing 10 at **Design Point DPOSA2**. The roadside ditch from this point is proposed as a triangular section with a minimum of 3' depth to accommodate flows and provide for 1' freeboard. As the velocity exceeds 5fps, this section will be reinforced with TRM as described above.

**Basin OSA3** is an offsite basin covering 69.15 acres of Filing 2-B to the northwest of Filing 10. Flows generated by this basin ( $Q_5$ =29.3 cfs and  $Q_{100}$ =113.4 cfs) travel via roadside ditch and cross lot drainage ditch to the southeast before entering Filing 10 at **Design Point DPOSA3**. Flows continue on from this point via a redefined trapezoidal ditch with a 10' bottom width and 4:1 side slopes to the southeast. This stretch of ditch through will be reinforced with TRM as described above.

**Basin OSA4** is an offsite basin covering 32.65 acres of Filing 7-A to the northwest of Filing 10. Flows generated by this basin ( $Q_5=16.0$  cfs and  $Q_{100}=60.5$  cfs) travel via roadside ditch and cross lot drainage ditch to the southeast before entering Filing 10 at **Design Point DPOSA4**. Flows continue on from this point via a redefined trapezoidal ditch with a 6' bottom width and 4:1 side slopes to the south. This stretch of ditch through will be reinforced with TRM as described above.

**Basin OSA5** is an offsite basin covering 11.33 acres of Filing 7-A to the north of Filing 10. Flows generated by this basin ( $Q_5$ =7.3 cfs and  $Q_{100}$ =28.1 cfs) travel via roadside ditch and cross lot drainage ditch to the south before entering Filing 10 at **Design Point DPOSA5**.

**Basin B1** is a 3.20-acres offsite basin located in future Filing 12. This basin is considered in its developed condition in order to adequately size the downstream facilities. Flows generated by this basin ( $Q_5=1.9$  cfs and  $Q_{100}=8.0$  cfs) follow natural drainage patterns to the southwest before entering Filing 10 at **Design Point DPB1**.

**Basin A1** is a 13.55-acre onsite basin covering the majority of proposed Lots 22 through 26, north of Conestoga Trail South. Flows generated by this basin ( $Q_5$ =7.2 cfs and  $Q_{100}$ =29.0 cfs) combine with those from offsite basins OS2-OS5 and Basin B1 and generally follow natural drainage patterns, some redefined, to the south towards **Design Point DP1**. The roadside ditch along the southern boundary of this basin is proposed as a triangular section with a minimum of 4' depth to accommodate flows and provide for 1' freeboard. As the velocity exceeds 5fps, this section will be reinforced with TRM as described above.

**Design Point DP1** represents the combined flows of Basins OSA3-OS5, B1 and A1. Flows continue from this point via the proposed 4-36" culverts that crosses under Conestoga Trail South. From there, a redefined trapezoidal ditch with a 10' bottom width and 4:1 side slopes will direct flows towards the existing South Pond detention facility. This stretch of ditch through Lot 2 will be reinforced with TRM as described above. The existing low-tailwater drop structure is sufficient to accommodate these flows.

**Basin A2** (7.24-acres) covers Lot 18 and a portion of proposed Lot 19, south of Conestoga Trail South, along with the South Pond detention facility. Flows generated by this basin ( $Q_5$ =3.9 cfs and  $Q_{100}$ =14.8 cfs) are directed to the South Pond at **Design Point DP2.** 

**Design Point DP2** is located at the bottom of the South Pond and represents the flows from

as the increase in flows are indicated as minor, please address the downstream and provide a statement that the minor

Basil increase in flows will not adversely impact the downstream. for for This applies to other basins with minor increases provided they

er discussion below

do not adversely affect the downstream.

**Basin A3** (6.46-acres) covers Lors 20 & 21 and a pornion of Lor 17, south of Conestoga Trail South. Flows generated by this basin  $Q_5$ =2.9 cfs and  $Q_{100}$ =12.8 cfs) follow natural drainage patterns to the south and **Design Point DP3**. This basin covers an area proposed as large lot single family sites (2.5-acre lots with imperviousness less than 10%). ECM I.7.1.B.5 considers this as an applicable exclusion from post-construction stormwater management requirements. A comparison of flows exiting the site at DP3 versus existing DP1 indicates that this area would experience the following increases in flows in the developed condition:  $Q_5$ =1.1 cfs and  $Q_{100}$ =0.6 cfs. As these flows are minor, no detention is proposed for this area, and flows will continue to follow the natural drainage path to the southeast.

**Basin B2** is a 0.78-acre offsite basin located in future Filing 12 to the north of Filing 10. This basin is considered in its developed condition in order to adequately size the downstream facilities. Flows generated by this basin ( $Q_5=0.5$  cfs and  $Q_{100}=2.1$  cfs) follow natural drainage patterns to the south and **Design Point DPB2**.

**Basin A4** (6.03-acres) covers the majority of Lots 27 & 28, north of Conestoga Trail South. Flows generated by this basin ( $Q_5$ =3.3 cfs and  $Q_{100}$ =13.0 cfs) combine with those from upstream basin B2 and follow natural drainage paths to the south where they are captured by the roadside ditch and carried east to **Design Point DP4**.

Design Point DP4 represents the combined flows of Basins A4 and B2. Flows continue from this point via roadside ditch to the east. The roadside ditch from this point is proposed as a triangular section with a minimum of 2' depth to accommodate flows and provide for 1' freeboard.

Please address the stock pond within this basin. Is it intended to stay or will it be breached? Contact the state.

**Basin B3** is a 5.24-acre offsite basin located in future Filing 12 to the north of Filing 10. This basin is considered in its developed condition in order to adequately size the downstream facilities. Flows generated by this basin ( $Q_5=2.9$  cfs and  $Q_{100}=12.5$  cfs) follow natural drainage patterns to the southeast and **Design Point DPB3**.

**Basin A5** (8.02-acres) covers the majority of Lots 29-31, north of Conestoga Trail South. Flows generated by this basin ( $Q_5$ =4.3 cfs and  $Q_{100}$ =17.5 cfs) combine with those from basin B3 and follow natural drainage paths to the south where they are captured by the roadside ditch and carried east to **Design Point DP5**.

**Design Point DP5** represents the combined flows of Basins A5 and B3.

**Design Point DP5A** is located where the flows leave Basin A5 and represents the combined flows from DP4 and DP5. Flows continue from this point via roadside ditch to the east. The roadside ditch from this point is proposed as a triangular section with a minimum of 2.5' depth to accommodate flows and provide for 1' freeboard.

**Basin A6** (4.02-acres) covers the majority of Lot 32 and portions of Lots 31 & 33, north of Conestoga Trail South. Flows generated by this basin ( $Q_5$ =2.1 cfs and  $Q_{100}$ =7.9 cfs) are directed south where they are captured by the roadside ditch and carried east to **Design Point DP6**.

Design Point DP6A is located where the flows leave Basin A6 and represents the combined flows of DP5A and DP6. Flows continue from this point via roadside ditch to the east. The roadside ditch from this point is proposed as a triangular section with a minimum of 2.5' depth to accommodate flows and provide for 1' freeboard. As the velocity exceeds 5fps, this section will be reinforced with TRM as described above.

Basin A7 (0.63-acres) covers the eastern side of Irish Hunter Trail just north of Conestoga Trail South. Flows generated by this basin ( $Q_5=0.7$  cfs and  $Q_{100}=2.0$  cfs) follow the roadside ditch to the south where they are intercepted by a proposed public 18" culvert at **Design Point DP7.** Flows continue to the west via the culvert towards Basin A8. The roadside ditch along the west side of this basin is proposed as a triangular section with a minimum of 1.5' depth to accommodate flows and provide for 1' freeboard. As the velocity exceeds 5fps, this section will be reinforced with TRM as described above.

Basin A8 (7.21-acres) covers the majority of Lots 34 & 35 and portions of Lots 32 & 33, at the northwest intersection of Conestoga Trail South & Irish Hunter Trail. Flows generated by this basin ( $Q_5$ =3.2 cfs and  $Q_{100}$ =12.8 cfs) follow natural drainage paths to the south & east where they are captured by the roadside ditches and carried to the southeast corner and **Design** Point DP8. The roadside ditch along the southern edge of this basin is proposed as a triangular section with a minimum of 3' depth to accommodate flows and provide for 1' freeboard. As the velocity exceeds 5fps, this section will be reinforced with TRM as described above.

Design Point DP8A represents the combined flows of DP 6A, 7 and 8. Flows continue southeast from this point via proposed public 36" culvert to ultimately reach the proposed G14b detention facility.

**Basin A9** (3.23-acres) covers the southern half of Conestoga Trail and northern portion of Lots 12 through 17. Flows generated by this basin ( $Q_5$ =4.3 cfs and  $Q_{100}$ =9.7 cfs) are directed to the roadside ditch and carried east towards a proposed Type D area inlet and low point at Design Point DP9. The roadside ditch along this basin is proposed as a triangular section with a minimum of 2' depth to accommodate flows and provide for 1' freeboard.

Basin A10 covers a portion of Lots 11 & 12, south of Conestoga Trail South, and proposed detention facility G14b. Flows generated by this basin (Q5=0.1 cfs and Q100=1.1 cfs) are directed to the proposed G14b detention facility at Design Point DP10.

Design Point DP10 is located at the bottom of Pond G14b and represents the flows from DP8A, 9 and 10. See further discussion below for facility design and discharge rates.

Basin A10A covers the portion of Lots 11 & 12, that will not drain to the G14b detention facility. Flows generated by this basin (Q5=0.8 cfs and Q100=3.4 cfs) will follow natural drainage patterns to the south towards Design Point 10A along the southern boundary of Filing 10, where they will combine with the discharge flows from G14b detention facility  $(Q_5=0.2 \text{ cfs} \text{ and } Q_{100}=66.9 \text{ cfs})$ . This basin covers an area proposed as large lot single family site (2.5-acre lots with imperviousness less than 10%). ECM I.7.1.B.5 considers this as an applicable exclusion from post-construction stormwater management requirements. In order to address the detention requirement, the been

The combined flows at this location are much greater than predevelopment conditions please revise accordingly to be at or

below historic.

oversized to include a basin area and imperviousness equivalent to Basin A10A.

**Basin B5** is a 1.59-acre offsite basin located in future Filing 12 to the west of Filing 10. This basin is considered in its developed condition in order to adequately size the downstream facilities. Flows generated by this basin ( $Q_5=1.0$  cfs and  $Q_{100}=4.2$  cfs) follow natural drainage paths to the southeast and **Design Point DPB5**.

**Basin A11** (3.61-acres) covers the majority of Lot 38 and a portion of Lot 39, west of Irish Hunter Trail. Flows generated by this basin ( $Q_5=1.9$  cfs and  $Q_{100}=7.9$  cfs) combine with those from upstream Basin B5 and follow natural drainage paths to the west where they are intercepted by the roadside ditch and carried to the south to **Design Point DP11**. The roadside ditch from this point is proposed as a triangular section with a minimum of 2' depth to accommodate flows and provide for 1' freeboard.

**Design Point DP11** is located where the flows leave Basin A11 and represents the combined flows of Basins A11 and B5.

**Basin A12** (2.36-acres) covers the majority of Lot 37 and a portion of Lot 36, west of Irish Hunter Trail. Flows generated by this basin ( $Q_5=1.4$  cfs and  $Q_{100}=5.5$  cfs) are directed east where they are captured by the roadside ditch and carried to the south to **Design Point DP12**. The roadside ditch along this basin is proposed as a triangular section with a minimum of 2' depth to accommodate flows and provide for 1' freeboard.

**Design Point DP12A** is located where the flows leave Basin A12 and represents the combined flows of DP11 and DP12.

**Basin B4** is a 7.14-acre offsite basin located in future Filing 12 to the west of Filing 10. This basin is considered in its developed condition in order to adequately size the downstream facilities. Flows generated by this basin ( $Q_5=5.0$  cfs and  $Q_{100}=18.9$  cfs) will follow natural drainage patterns to the southeast and **Design Point DPB4.** The future development of Filing 12 currently proposed a cul-de-sac and redefined drainage channel for Basin B4. Future design of Filing 12 will need to be analyzed at that time to confirm compatibility with this Filing 10.

**Basin A13** covers the majority of Lot 36 and a portion of Lots 35 & 37, west of Irish Hunter Trail. Flows generated by this basin ( $Q_5=1.8$  cfs and  $Q_{100}=7.3$  cfs) combine with those from Basin B4 and are directed east via redefined drainage channel where they are captured by the roadside ditch and carried to **Design Point DP13**. The roadside ditch along this basin is proposed as a triangular section with a minimum of 2.5' depth to accommodate flows and provide for 1' freeboard. As the velocity exceeds 5fps, this section will be reinforced with TRM as described above. The redefined drainage ditch through this area has been designed as a trapezoidal ditch with a 3' bottom width and 4:1 side slopes.

**Design Point DP13A** is located where the flows leave Basin A13 at a 36" culvert that crosses under Irish Hunter Trail to the east and represents the combined flows of DPB4, 12A and 13.

**Basin A14** covers the eastern half of Irish Hunter Trail and the western portion of Lots 5-8. Flows generated by this basin ( $Q_5$ =2.2 cfs and  $Q_{100}$ =4.9 cfs) are directed to the roadside ditch and carried to the south towards **Design Point DP14**. The roadside ditch from this

point is proposed as a triangular section with a minimum of 2' depth to accommodate

flows and provide for 1' freeboard.

Design Point DP14A is located where the flows leave Basin A14 ar historic flows. Please revise combined flows from DP13A and 14. Flows continue on from this poir the design accordingly to be trapezoidal ditch with a 3' bottom width and 4:1 side slopes, and will dit at or below historic. the proposed G18 detention facility. This stretch of ditch through will be re as described above. A low-tailwater drop structure with receive th Also, please indicate where discharge into the proposed detention facility.

Basin A15 covers Lots 6 through 8 and a portion of Lots 9 & 10, east of/Irish ditch. Will it be conveyed to with the proposed detention facility G18. Flows generated by this basi the existing 30x42" culvert Q<sub>100</sub>=7.8 cfs) follow natural drainage paths that carry the flows to **besign** crossing Eastonville? Is the

**Design Point DP15** is located at the bottom of Pond G18 and represe DP14A and Basin A15.

The flows at this design point are greater than

this flow will be conveyed once entering the roadside existing culvert deficient or adequate? Please analyze and address.

**Basin A15A** covers the portion of Lots 6, 8, 9 & 10, that will not drain to the G18 detention facility. Flows generated by this basin (Q<sub>5</sub>=1.1 cfs and  $\sqrt{Q_{100}}$ =4.6 cfs) will follow natural drainage patterns to the east towards Design Point 15A along the eastern boundary of Filing 10, where they will combine with the discharge flows from G18 detention facility (Q<sub>5</sub>=0.1 cfs and Q<sub>100</sub>=27,1 cfs). This basin covers an area proposed as a large lot single family site (2.5-acre lots with imperviousness less than 10%). ECM I.7.1.B.5 considers this as an applicable exclusion from post-construction stormwater management requirements. In order to address the detention requirement, the adjacent detention facility G18 has been oversized to include a basin area and imperviousness equivalent to Basin A15A.

31.5 cfs per pond calc.

Basin A16 covers the majority of Lots 16 & 17, south of Conestaga Trail South. Flows generated by this basin ( $Q_5=1.9$  cfs and  $Q_{100}=8.2$  cfs) follow natural drainage patterns to the south and Design Point DP16 along the southern boundary of Filing 10. This basin covers an area proposed as large lot single family sites (2.5-acre lots with imperviousness less than 10%). ECM I.7.1.B.5 considers this as an applicable exclusion from post-construction stormwater management requirements. A comparison of flows exiting the site at DP16 versus existing DP3 indicates a significant reduction in flows in the developed condition:  $Q_5$ =0.8 cfs and  $Q_{100}$ =9.9 cfs. As the developed flows are less than existing in this location, no detention is proposed for this area, and flows will continue to follow the natural drainage path to the south.

Basin A17 covers the majority of Lots 14 & 15, south of Conestaga Trail South. Flows generated by this basin ( $Q_5=2.1$  cfs and  $Q_{100}=8.9$  cfs) are directed south to **Design Point DP17** along the southern boundary of Filing 10. This basin covers an area proposed as large lot single family sites (2.5-acre lots with imperviousness less than 10%). ECM I.7.1.B.5 considers this as an applicable exclusion from post-construction stormwater management requirements. A comparison of flows exiting the site at DP17 versus existing DP4 indicates that this area would experience the following increases in flows in the developed condition:  $Q_5=0.8$  cfs and  $Q_{100}=0.7$  cfs. As these flows are minor, no detention is proposed for this area, and flows will continue to follow the natural drainage path to the southeast.

Basin A18 covers a portion of Lots 13 & 14, south of Conestoga Trail South. Flows generated

by this basin ( $Q_5$ =0.9 cfs and  $Q_{100}$ =4.1 cfs) are directed south to **Design Point DP18** along the southern boundary of Filing 10. This basin covers an area proposed as large lot single family sites (2.5-acre lots with imperviousness less than 10%). ECM I.7.1.B.5 considers this as an applicable exclusion from post-construction stormwater management requirements. A comparison of flows exiting the site at DP18 versus existing DP5 indicates a significant reduction in flows in the developed condition:  $Q_5$ =2.3 cfs and  $Q_{100}$ =17.6 cfs. As the developed flows are less than existing in this location, no detention is proposed for this area, and flows will continue to follow the natural drainage path to the south.

**Basin A19** covers a portion of Lots 12 & 13, south of Conestoga Trail South. Flows generated by this basin ( $Q_5$ =1.1 cfs and  $Q_{100}$ =4.7 cfs) are directed south to **Design Point DP19** along the southern boundary of Filing 10. This basin covers an area proposed as large lot single family sites (2.5-acre lots with imperviousness less than 10%). ECM I.7.1.B.5 considers this as an applicable exclusion from post-construction stormwater management requirements. A comparison of flows exiting the site at DP19 versus existing DP6 indicates a significant reduction in flows in the developed condition:  $Q_5$ =0.8 cfs and  $Q_{100}$ =8.2 cfs. As the developed flows are less than existing in this location, no detention is proposed for this area, and flows will continue to follow the natural drainage path to the south.

**Basin A20** covers a portion of Lots 9 & 10, north of Conestoga Trail South. Flows generated by this basin ( $Q_5$ =1.1 cfs and  $Q_{100}$ =4.8 cfs) are directed south where they are captured by the roadside ditch and carried east to **Design Point DP20** before discharging into the existing roadside ditch along Eastonville Road. The roadside ditch along this basin is proposed as a triangular section with a minimum of 2' depth to accommodate flows and provide for 1' freeboard. A 1.23-acre portion of this basin covers an area proposed as large lot single family sites (2.5-acre lots with imperviousness less than 10%). ECM I.7.1.B.5 considers this as an applicable exclusion from post-construction stormwater management requirements. In order to address the detention requirement, the adjacent detention facility G18 has been oversized to include a basin area and imperviousness equivalent to Basin A20.

**Basin A21** covers the southern half of Conestoga Trail and northern portion of Lot 11. Flows generated by this basin  $Q_5$ =0.7 cfs and  $Q_{100}$ =2.2 cfs) are directed to the roadside ditch and carried east to **Design Point DP21** before discharging into the existing roadside ditch along Eastonville Road. The roadside ditch along this basin is proposed as a triangular section with a minimum of 1.5 depth to accommodate flows and provide for 1' freeboard. In order to address the detention requirement, the adjacent detention facility G18 has been oversized to include a basin area and imperviousness equivalent to Basin A21.

The remaining 0.95-acre portion of basin A20 and the entirety of basin A21 (0.73-acres), cover an area that is not tributary to a control measure, due to the connection into the existing Eastonville Road. ECM 1.7.C.1.a considers up to 20% (not to exceed 1-acre), of the applicable development where it is not practicable to capture runoff from portions of the site that will not drain to control measures, as an applicable exclusion from post-construction stormwater management requirements. These areas combined (1.68-acres) cover 1.3% of the Filing 10 125.6-acres, which while greater than 1-acre, is significantly less than 20%. As mentioned above, in order to address the detention requirement, the adjacent detention facility G18 has been oversized to include a basin area and imperviousness equivalent to Basins A20 and A21.

please clarify where the flows from these basins are conveyed to after reaching Eastonville Road **Basin A22** covers the majority of Lot 11, south of Conestoga Trail South. Flows generated by this basin ( $Q_5=1.1$  cfs and  $Q_{100}=4.5$  cfs) follow natural drainage patterns south to **Design Point DP22** along the southern boundary of Filing 10. This basin covers an area proposed as a large lot single family site (2.5-acre lots with imperviousness less than 10%). ECM I.7.1.B.5 considers this as an applicable exclusion from post-construction stormwater management requirements. A comparison of flows exiting the site at DP22 versus existing DP8 indicates that this area would experience the following increases in flows in the developed condition:  $Q_5=0.4$  cfs and  $Q_{100}=0.2$  cfs. As these flows are minor, no detention is proposed for this area, and flows will continue to follow the natural drainage path to the southeast.

**Basin A23** covers a portion of Lot 11, south of Conestoga Trail South. Flows generated by this basin ( $Q_5$ =0.1 cfs and  $Q_{100}$ =0.9 cfs) are directed east to **Design Point DP23** before discharging into the existing roadside ditch along Eastonville Road. This basin covers a potion of Lot 11 along Eastonville Road that is encumbered by easements and setbacks, as such it can be considered to remain undeveloped. In order to address the detention requirement, the adjacent detention facility G18 has been oversized to include a basin area and imperviousness equivalent to Basin A23.

**Basin OSA6** is an offsite basin just north of Lot 43, west of Irish Hunter Trail at the north end of Filing 10. This basin is considered in its developed condition in order to adequately size the downstream facilities. Flows generated by this basin ( $Q_5$ =0.6 cfs and  $Q_{100}$ =2.3 cfs) follow natural drainage paths to the south and **Design Point DPOSA6**.

**Basin B6** is a 7.92-acre offsite basin located in future Filing 12 to the west of Filing 10. This basin is considered in its developed condition in order to adequately size the downstream facilities. Flows generated by this basin ( $Q_5$ =4.4 cfs and  $Q_{100}$ =19.0 cfs) are directed to **Design Point DPB6**.

**Basin A24** covers the majority of Lots 39 through 43, west of Irish Hunter Trail. Flows generated by this basin ( $Q_5$ =6.6 cfs and  $Q_{100}$ =26.3 cfs) combine with those from OSA6 and Basin B6 and follow natural drainage paths to the east where they are captured by the roadside ditch and carried south to a low point at **Design Point DP24**. The roadside ditch along this basin is proposed as a triangular section with a minimum of 2.5' depth to accommodate flows and provide for 1' freeboard. As the velocity exceeds 5fps, this section will be reinforced with TRM as described above.

**Design Point DP24A** is located where the flows leave Basin A24 via a 36" culvert that crosses under Irish Hunter Trail to the east and represents the combined flows of DPB6, DP24 and OSA2. Flows continue on from this point via a redefined trapezoidal ditch with a 3" bottom width and 4:1 side slopes, and will direct flows towards the proposed G19 detention facility. A low-tailwater drop structure with receive these flows before discharge into the proposed detention facility.

**Basin A25** covers the eastern half of Irish Hunter Trail and the western portion of Lots 1-4. Flows generated by this basin ( $Q_5$ =2.8cfs and  $Q_{100}$ =6.3 cfs) are directed to the roadside ditch and carried to a low point at **Design Point DP25**. The roadside ditch along this basin is proposed as a triangular section with a minimum of 2.5' depth to accommodate flows and provide for 1' freeboard.

basin description of A27 and DP27 is missing as well as basins A28, and A29, and there design points. Please provide.

Design Point DP25A is located where the flows leave Basin A25 via a redefined drainage ditch and represents the combined flows from DP24A and DP25.

Basin A26 covers Lots 1 through 4, east of Irish Hunter Trail. Flows gen are greater than historic flows. ( $Q_5=2.1$  cfs and  $Q_{100}=9.4$  cfs) are directed to **Design Point DP26.** 

**Design Point DP26** is located at the bottom of Pond G19 and repre historic. DP25A, OSA4 and Basin A26.

Basin A26A covers the portion of Lots 1-4, that will not drain to the G this flow will be conveyed Flows generated by this basin (Q5=0.6 cfs and Q100=2.6 efs) will follo once entering the roadside patterns to the east towards Design Point 26A along the eastern be ditch. Will it be conveyed to where they will combine with the discharge flows from G19 detentio the existing 36" culvert and Q<sub>100</sub>=37.8 cfs). This basin covers an area proposed as a large lot s crossing Eastonville? Is the acre lots with imperviousness less than 10%). ECM I.7.1.B.5 considers the exclusion from post-construction stormwater management require adequate? Please analyze address the detention requirement, the adjacent detention facility G1 and address. to include a basin area and imperviousness equivalent to Basin A26A.

The flows at this design point Please revise the design accordingly to be at or below

Also, please indicate where existing culvert deficient or

Basin OSA7 is an offsite basin just north of Lot 1, east of Irish Hunter Trail. Flows generated by this basin ( $Q_5=1.2$  cfs and  $Q_{100}=5.1$  cfs) follow natural drainage patterns to the east and Design Point DPOSA7. This basin is not being developed as part of Filing 10, but is considered due to the proximity of the major basin line to the north.

Basin A30 covers a small 0.61-acre area at the northwestern corner of Filing 10. This basin sits within the Upper Black Squirrel drainage basin. Flows generated by this basin (Q₅=0.3

cfs and Q<sub>100</sub>=1.3 cfs) will follow natural drainage paths to the Filing 12. This area will need to be analyzed as part of the Filin adequate sizing of downstream facilities.

This should be a combination of DP 21, 22, 24 comparing to DP 9. Please add as it appears to have been removed from version 1 of this report

See below for a comparison of flows at similar design points in detained and undetained condition:

	Existing			Developed	
DP	Q₅ (CFS)	Q <sub>100</sub> (CFS)	DP	Q <sub>5</sub> (CFS)	Q <sub>100</sub> (CFS)

#### 10.0 PROPOSED FULL-SPECTRUM DETENTION FACILITIES

#### **Existing South Pond**

Still above historic.

The existing South Pond was originally built with the development of Filing 7 and reanalyzed with the development of Filing 9 with modifications currently under construction. The Filing 9 analysis determined that an upstream watershed of 237.1-acres at 13.8% impervious was tributary to the South Pond, resulting in developed flows of  $Q_5$ =92 cfs and  $Q_{100}$ =347 cfs. This analysis accounts for the final design of this filing and results in a slightly lower imperviousness (13.3%) and subsequent flowrates ( $Q_5$ =74 cfs and  $Q_{100}$ =292 cfs). The MHFD spreadsheet with the modified imperviousness has been included in the appendix for reference, but as the impact to the detention facility is minor, no changes are proposed.

#### **Proposed Pond G14b**

The G14b facility is proposed as a private full-spectrum Extended Detention Basin (EDB). MHFD-Detention v4.06 calculations are provided in the appendix. Based on a watershed area of 40.57 acres, with an effective site imperviousness of 14.66%, the required pond volume for 100-yr detention is 1.77 acre-ft.

Flows enter the facility via 36" storm pipe and discharge directly into a concrete forebay. The forebay volume was calculated based on 3% of the WQCV volume. The forebay includes a dissipater as the flows enter, and a notch through which to exit to the trickle channel. In order to release the flows from the forebay at 2% of the peak 100-yr inflow the forebay has a minimum 6" wide notch. A 7' wide concrete trickle channel will run along the bottom of the pond from the forebay to the micropool.

The outlet structure will consist of a modified Type C outlet structure with an orifice plate and a grate on top. The orifice plate will have two 1.58 sq. inch orifices. The elevation of the grate is set at 7064.80, which is below the 100-year detention volume elevation. The outlet pipe has been set as a 36" private storm pipe that will release the 100-year flow at 100% of the predeveloped 100-year runoff rate, in accordance with drainage criteria. The outlet pipe discharges to the south following historic drainage patterns. A level spreader will be installed just downstream of the pipe outfall to mitigate the impact of the concentrated discharge point downstream. With these release rates the WQCV will drain in 40 hours, the EURV in 60 hours, and the 100-year storm volume in 67 hours. Given the smaller change in impervious coverage between the pre-developed and developed

condition, the WQCV drain time becomes the controlling factor for the orifice plate. The lowest orifice hole has been sized to release the WQCV within 40 hours, the second hole is sized accordingly and results in a 60 hour release rate for the EURV.

A 25' long spillway is located on the south side of the pond and is placed 1.90' below the crest of the pond to allow for 1' of freeboard above the spillway design flow depth. In the event that water overtops the spillway, it will discharge to the south following historic drainage patterns.

#### **Proposed Pond G18**

The G18 facility is proposed as a private full-spectrum Extended Detention Basin (EDB). MHFD-Detention v4.06 calculations are provided in the appendix. Based on a watershed area of 25.53 acres, with an effective site imperviousness of 13.12%, the required pond volume for 100-yr detention is 1.053 acre-ft.

Incoming swale flows will be received by a proposed Type L riprap rock chute (see appendix for calculations), before discharging into a proposed riprap low-tailwater basin (LTWB) at the base of the riprap rundown into the detention facility. This LTWB design was based on sizing guidance from MHFD Volume 2, Figures 9-37 and 9-39, equating the trapezoidal swale wetted perimeter as equivalent to a rectangular box culvert.

Pond G18	Top Width (ft)	Flow Depth + 1' freeboard (ft)
Trapezoidal Swale	11.8	2.1
Equivalent Box Culvert	12.0	2.5

From there, LTWB sizing was determined as D=1.5', W=12' and L=20', to be protected by Type L riprap. See appendix for calculations. The LTWB is proposed to discharge into a 7-ft wide concrete trickle channel along the bottom of the facility towards the proposed micropool and outlet structure.

The outlet structure will consist of a modified Type C outlet structure with an orifice plate and a grate on top. The orifice plate will have two 1.33 sq. inch orifices. The elevation of the grate is set at 7053.95, which is below the 100-year detention volume elevation. The outlet pipe has been set as a 30" private storm pipe that will release the 100-year flow at 100% of the predeveloped 100-year runoff rate, in accordance with drainage criteria. The outlet pipe discharges to the east into the roadside ditch along the west side of Eastonville Road following historic drainage patterns. With these release rates the WQCV will drain in 40 hours, the EURV in 6 hours, and the 100-year storm volume in 78 hours. Given the smaller change in impervious coverage between the pre-developed and developed condition, the WQCV drain time becomes the controlling factor for the orifice plate. The lowest orifice hole has been sized to release the WQCV within 40 hours, the second hole is sized accordingly and results in a 61 hour release rate for the EURV.

A 20' long spillway is located on the east side of the pond and is placed 2.15' below the crest of the pond to allow for 1' of freeboard above the spillway design flow depth. In the event that water overtops the spillway, it will discharge to the east following historic drainage patterns.

Maintenance access will be provided and is further outlined in the detention facility construction documents.

#### **Proposed Pond G19**

The G19 facility is proposed as a private full-spectrum Extended Detention Basin (EDB). MHFD-Detention v4.06 calculations are provided in the appendix. Based on a watershed area of 27.64 acres, with an effective site imperviousness of 12.62%, the required pond volume for 100-yr detention is 1.118 acre-ft.

Incoming swale flows will be received by a proposed Type L riprap rock chute (see appendix for calculations), before discharging into a proposed riprap low-tailwater basin (LTWB) at the base of the riprap rundown into the detention facility. This LTWB design was based on sizing guidance from MHFD Volume 2, Figures 9-37 and 9-39, equating the trapezoidal swale wetted perimeter as equivalent to a rectangular box culvert.

Pond G19	Top Width (ft)	Flow Depth + 1' freeboard (ft)
Trapezoidal Swale	11.8	2.1
Equivalent Box Culvert	12.0	2.5

From there, LTWB sizing was determined as D=1.5', W=12' and L=20', to be protected by Type L riprap. See appendix for calculations. The LTWB is proposed to discharge into a 6-ft wide concrete trickle channel along the bottom of the facility towards the proposed micropool and outlet structure.

The outlet structure will consist of a modified Type C outlet structure with an orifice plate and a grate on top. The orifice plate will have two 1.47 sq. inch orifices. The elevation of the grate is set at 7059.70, which is below the 100-year detention volume elevation. The outlet pipe has been set as a 30" private storm pipe that will release the 100-year flow at 100% of the predeveloped 100-year runoff rate, in accordance with drainage criteria. The outlet pipe discharges to the east into the roadside ditch along the west side of Eastonville Road following historic drainage patterns. With these release rates the WQCV will drain in 40 hours, the EURV in 61 hours, and the 100-year storm volume in 86 hours. Given the smaller change in impervious coverage between the pre-developed and developed condition, the WQCV drain time becomes the controlling factor for the orifice plate. The lowest orifice hole has been sized to release the WQCV within 40 hours, the second hole is sized accordingly and results in a 61 hour release rate for the EURV.

A 25' long spillway is located on the east side of the pond and is placed 2.25' below the crest of the pond to allow for 1' of freeboard above the spillway design flow depth. In the event that water overtops the spillway, it will discharge to the east following historic drainage patterns.

Maintenance access will be provided and is further outlined in the detention facility construction documents.

Include a cost estimate for each PBMP with line items for all components (ex: riprap, road base, forebay, trickle channel, outlet structure, outlet pipe, spillway, etc). Input the total value into the FAE form under "Permanent Pond/BMP (provide engineer's estimate)" in Section 1. The total should not include grading, which is a separate line item in Section 1: "Earthwork." The cost estimate should include labor costs (as a separate line item or added into the cost of each component).

#### 11.0 **FOUR-STEP PROCESS**

- 1. Employ Runoff Reduction Practices: The development of this project is proposed as single-family residential (2.5-acre). Roadways will utilize grass-lined roadside ditches to minimize directly connected impervious areas within the project site, while allowing for increased infiltration and reduced runoff volume.
- 2. Implement CM's that provide a Water Quality Capture Volume with slow release: The majority of runoff generated by this project will be treated through capture and slow release of the WQCV in one of four (3 proposed, 1 existing) permanent full spectrum extended detention facilities designed per current drainage criteria. The areas tributary to each of the detention facilities is described above.
- 3. Stabilize Drainage Ways: This site will utilize roadside ditches with culvert crossings throughout the site. The roadside ditches will direct developed flows to the detention facilities, to be released at or below historic rates. In reaches where velocities exceed 4fps, the ditches are proposed to be reinforced with turf reinforcement mats. narrative indicates 5fps
- 4. Implement Site Specific and other source control CM's: Standard residential source control will be utilized in order to minimize potential pollutants entering the drainage system. Site specific permanent and temporary source control BMPs will be established by the Stormwater Quality and Control Plan for the project to provide a conclusion summary protect receiving waters. and indicate whether this

Totals for Area of Interest			98.4	100.0%

#### **Description**

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

# VMax® TRMs

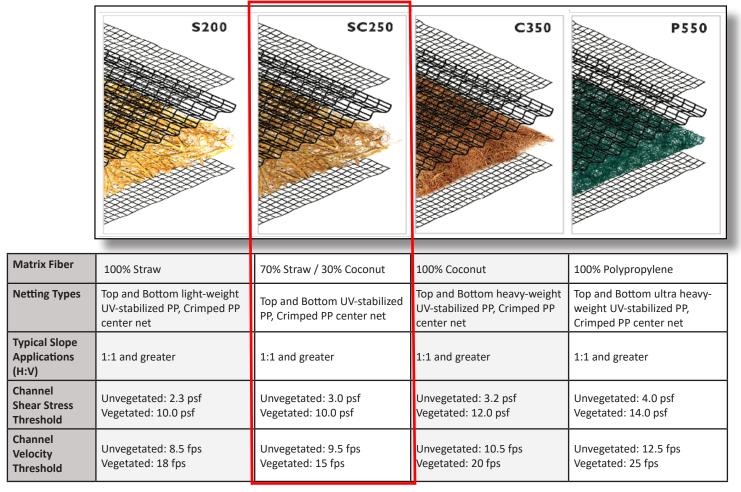

#### A Permanent Turf Reinforcement Mat Solution for Every Design

The VMax system of permanent TRMs are ideal for high-flow channels, streambanks, shorelines, and other areas needing permanent vegetation reinforcement and protection from water and wind. Our VMax TRMs combine a three-dimensional matting and a fiber matrix material for allout erosion protection, vegetation establishment and reinforcement. The VMax TRMs are available with various performance capabilities and support reinforced vegetative lining development from germination to maturity.

#### VMax® Unique Three-Dimensional Design

North American Green VMax TRMs are each designed to maximize performance through all development phases of a reinforced vegetative lining. The corrugated matting structure lends a true reinforcement zone for vegetation entanglement, especially compared to flat net mats. The unique design of the corrugated matting also helps to create a shear plane that deflects flowing water away from the soil surface. And the incorporation of a fiber matrix supplements the 3-D structure by creating a ground cover that blocks soil movement and aids in vegetation establishment.

#### Four VMax Turf Reinforcement Mats Designed for Every Level of Performance

Selected product that will work for all swales above 5 ft/s. Has maximum of 15 ft/s.

Copyright 2021.

North American Green, LLC. 4609 E. Boonville-New Harmony Rd., Evansville, IN (800) 772-2040 | www.nagreen.com

# VMax® TRMs cont.

#### Selecting the Right VMax TRM

Choosing the right VMax TRM can be made easy by utilizing our Erosion Control Materials Design Software (www.ecmds.com), which allows users to input project specific parameters for channels, slopes, spillways, and more and ensures proper evaluation, design, and product selection in return. Our four VMax TRMs offer varying performance values, fiber matrix longevities, and price points, to help you meet your project specific goals.

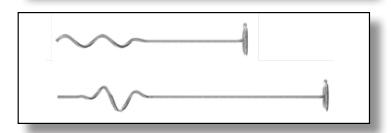

Utilizing the VMax TRMs in conjunction with Twist Pin fastener technology can result in an installed system that pushes TRM performance with increased factors of safety. The combined system has been shown to have superior pullout strength performance up to 200 lbs when compared to installation with traditional wire staples and pins. This is up to 10x the pullout resistance of wire staples and pins. Additionally, the use of the twist pins provides intimate contact between the TRM and the soil, and have been shown to be effective in a wide range of soil types. With a quick and easy installation using an electric drill and custom chuck, the TRM+Twist Pin system can eliminate time and labor costs from day 1 through project release.

VMax turf reinforcement mat being installed on a channel application (top right), twist pins installed with TRMs can have increased system performance and pullout resistance (middle right), twist pins are available in 8" and 12" lengths and two coil configurations designed for hard or soft soil types (lower right).

Comparison of common TRM fasteners based on pullout performance and typical application (below).

Fastener	Pullout Resistance (lb)	Comment
6" Round Top Pin	14	Best for hardened soils where other fasteners are damaged during installation.
6" Regular U-staple	42	Standard fastener that develops additional pullout as legs may deflect and add friction during installation.
12" Pin with Washer	35	Standard fastener good for soils where staples can be bent frequently and are too difficult to install.
18" Pin with Washer	27	Standard fastener good for soils where staples are frequently bent and 12" straight pins fail to provide sufficient pullout because surface soil is wet or loose.
Twist Pin	170	Upgraded fastener that provides high pullout and ideal for loose or soft soils.

#### DETENTION BASIN OUTLET STRUCTURE DESIGN

MHFD-Detention, Version 4.06 (July 2022)

Summary Stage-Area-Volume-Discharge Relationships
The user can create a summary S-A-V-D by entering the desired stage increments and the remainder of the table will populate automatically.
The user should graphically compare the summary S-A-V-D table to the full S-A-V-D table in the chart to confirm it captures all key transition points.

Stage - Storage Description	Stage [ft]	Area [ft²]	Area [acres]	Volume [ft <sup>3</sup> ]	Volume [ac-ft]	Total Outflow [cfs]	
							For best results, include the
							stages of all grade slope changes (e.g. ISV and Floor)
							from the S-A-V table on
							Sheet 'Basin'.
							Also include the inverts of all
							outlets (e.g. vertical orifice, overflow grate, and spillway,
							where applicable).

MHFD-Detention, Version 4.06 (July 2022)

Summary Stage-Area-Volume-Discharge Relationships
The user can create a summary S-A-V-D by entering the desired stage increments and the remainder of the table will populate automatically.
The user should graphically compare the summary S-A-V-D table to the full S-A-V-D table in the chart to confirm it captures all key transition points.

Stage - Storage Description	Stage [ft]	Area [ft²]	Area [acres]	Volume [ft <sup>3</sup> ]	Volume [ac-ft]	Total Outflow [cfs]	
							For best results, include the
							stages of all grade slope
							changes (e.g. ISV and Floor
							from the S-A-V table on
							Sheet 'Basin'.
							Also include the inverts of a
							outlets (e.g. vertical orifice
							overflow grate, and spillwa
							where applicable).

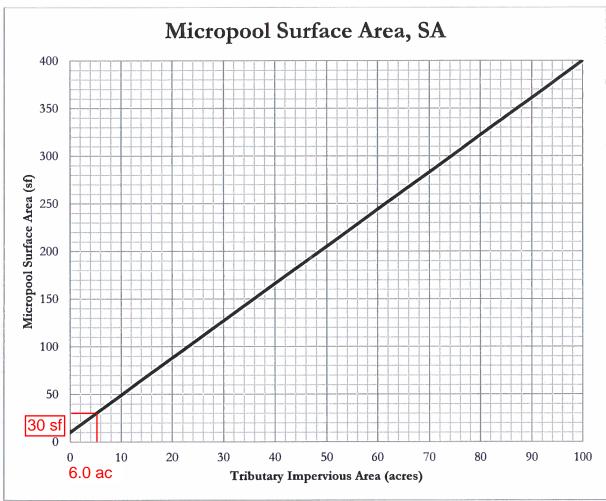

Figure 1 - Micropool surface area (SA) determination chart

The tributary impervious area is the effective number of impervious acres that will be treated by the extended detention basin (EDB). It is calculated by multiplying the tributary area to be treated by the impervious fraction of that area.

$$TIA = I \times A = (14.7/100) \times 40.57 \text{ ac} = 6.0 \text{ ac}$$
 $TIA = Tributary impervious area (acres)$ 
 $I = Imperviousness (fraction)$ 
 $I = Tributary catchment area upstream (acres)$ 

For EDBs with tributary impervious areas greater than 100 acres, the micropool surface area is 400 sf. The initial surcharge depth (ISD) is defined as the depth of the initial surcharge volume (ISV). The surface area determined using Figure 1 assumes an ISD of 4 inches. The initial surcharge volume is thus calculated by multiplying the micropool surface area by 4 inches.

$$ISV = SA \times 4 inches$$
  
 $ISV = SA \times 4 inches$   
 $SA = Surface area (from Figure 1, sf)$

MHFD-Detention, Version 4.06 (July 2022)

Summary Stage-Area-Volume-Discharge Relationships
The user can create a summary S-A-V-D by entering the desired stage increments and the remainder of the table will populate automatically.
The user should graphically compare the summary S-A-V-D table to the full S-A-V-D table in the chart to confirm it captures all key transition points.

Stage - Storage Description	Stage [ft]	Area [ft²]	Area [acres]	Volume [ft <sup>3</sup> ]	Volume [ac-ft]	Total Outflow [cfs]	
							For best results, include the
							stages of all grade slope
							changes (e.g. ISV and Floor
							from the S-A-V table on
							Sheet 'Basin'.
							Also include the inverts of a
							outlets (e.g. vertical orifice
							overflow grate, and spillwa
							where applicable).

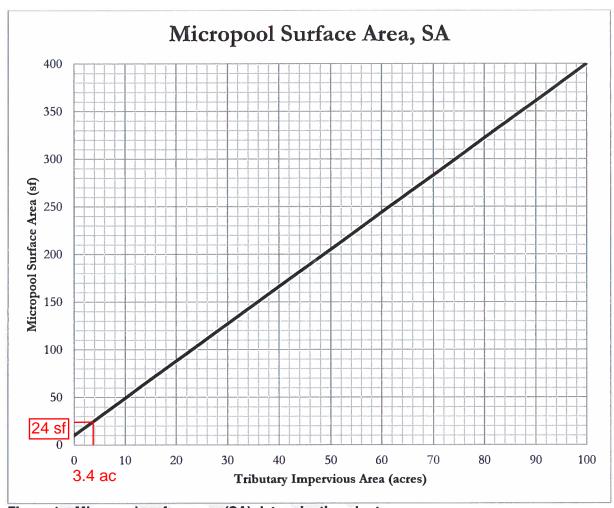

Figure 1 - Micropool surface area (SA) determination chart

The tributary impervious area is the effective number of impervious acres that will be treated by the extended detention basin (EDB). It is calculated by multiplying the tributary area to be treated by the impervious fraction of that area.

$$TIA = I \times A = (13.2/100) \times 25.53 \text{ ac} = 3.4 \text{ ac}$$
 $TIA = Tributary impervious area (acres)$ 
 $I = Imperviousness (fraction)$ 
 $I = Tributary catchment area upstream (acres)$ 

For EDBs with tributary impervious areas greater than 100 acres, the micropool surface area is 400 sf. The initial surcharge depth (ISD) is defined as the depth of the initial surcharge volume (ISV). The surface area determined using Figure 1 assumes an ISD of 4 inches. The initial surcharge volume is thus calculated by multiplying the micropool surface area by 4 inches.

$$ISV = SA \times 4 inches$$
  
 $ISV = Initial surcharge volume (cf)$   
 $SA = Surface area (from Figure 1, sf)$

MHFD-Detention, Version 4.06 (July 2022)

Summary Stage-Area-Volume-Discharge Relationships
The user can create a summary S-A-V-D by entering the desired stage increments and the remainder of the table will populate automatically.
The user should graphically compare the summary S-A-V-D table to the full S-A-V-D table in the chart to confirm it captures all key transition points.

Stage - Storage Description	Stage [ft]	Area [ft²]	Area [acres]	Volume [ft <sup>3</sup> ]	Volume [ac-ft]	Total Outflow [cfs]	
		,					For best results, include the
							stages of all grade slope
							changes (e.g. ISV and Floor
							from the S-A-V table on
							Sheet 'Basin'.
							Also include the inverts of a
							outlets (e.g. vertical orifice
							overflow grate, and spillwa

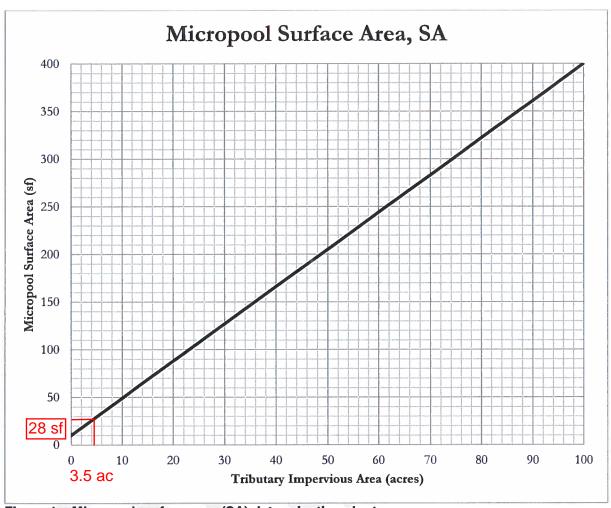

Figure 1 - Micropool surface area (SA) determination chart

The tributary impervious area is the effective number of impervious acres that will be treated by the extended detention basin (EDB). It is calculated by multiplying the tributary area to be treated by the impervious fraction of that area.

$$TIA = I \times A = (12.6/100) \times 27.64 \text{ ac} = 3.5 \text{ ac}$$
 $TIA = Tributary impervious area (acres)$ 
 $I = Imperviousness (fraction)$ 
 $I = Tributary catchment area upstream (acres)$ 

For EDBs with tributary impervious areas greater than 100 acres, the micropool surface area is 400 sf. The initial surcharge depth (ISD) is defined as the depth of the initial surcharge volume (ISV). The surface area determined using Figure 1 assumes an ISD of 4 inches. The initial surcharge volume is thus calculated by multiplying the micropool surface area by 4 inches.

$$ISV = SA \times 4 inches$$
  
 $ISV = SA \times 4 inches$   
 $ISV = SA \times 4 inches$

MASTER DEVELOPMENT /
PRELIMINARY DRAINAGE PLAN
LATIGO TRAILS
EL PASO COUNTY, COLORADO

October 4, 2001

Prepared for:

RMBG, LLC #2 5170 Mark Dabling Blvd. COLORADO SPRINGS, CO 80918

PREPARED BY:

URS

9960 Federal Drive, Suite 300 Colorado Springs, CO 80921

URS PROJECT NO. 67-00042443

MDDP EXCERPT

Four sub-basins, varying from 3 to 53 acres, lie north of Latigo Blvd, draining mainly to the east, with excess runoff ponding at Eastonville Road and eventually overtopping it. One of these basins (9.71) drains directly to Upper Black Squirrel Creek. There is a Zone-A, unstudied FEMA floodplain to the north of the proposed development, in the open space / Upper Black Squirrel Creek area.

#### Gieck Ranch Basin

The Gieck Ranch Basin covers the southern half of the subject area. Runoff is generally southeasterly, draining to Meridian Ranch to the south, and crossing Eastonville Road at three points to the east. As with the Upper Black Squirrel Creek Basin, many of the existing drainageways (mainly to the south) are not clearly defined.

The major drainage course begins at the west-central portion of the site, traversing the Gieck Ranch Basin to design point G11 to the southeast. Six sub-basins, varying from 19 to 39 acres, contribute to this drainage course, which collects approximately 65% of the runoff generated within the Gieck Basin in Latigo Trails. To the west of this, eight sub-basins drain to five design points along the Meridian Ranch boundary, two of which (G5 and G6) combine shortly after entering Meridian Ranch, at G6b.

There are eight small sub-basins east of the major drainage course, varying from 2 to 41 acres. All but one drain at their own design point, either crossing Eastonville Road or onto Meridian Ranch. The three culverts crossing Eastonville Road include an 18" CMP, a 30" CMP, and a 42"x28" Arch CMP. The 30" CMP has the capacity for 31 cfs, which is inadequate for existing flows. The other two pipes are adequate for existing and developed flows. The drainageways entering Meridian Ranch are not very well defined.

Four stock ponds exist on the site, but are assumed to be full at the beginning of a storm as part of this analysis. If the ponds were empty, flows at G2 may be reduced by about 30 cfs, flows at G10 and G11 may be reduced by about 34 cfs, flows at G13 may be reduced by about 23 cfs, and flows at B1, B2 and B3 may be reduced by about 45 cfs (for flows up to 100-year storm estimates).

See Tables 3 and 4 for flow calculations at specific design points and further comments.

## DETENTION BASIN OUTLET STRUCTURE DESIGN

MHFD-Detention, Version 4.04 (February 2021)

Summary Stage-Area-Volume-Discharge Relationships

The user can create a summary S-A-V-D by entering the desired stage increments and the remainder of the table will populate automatically.

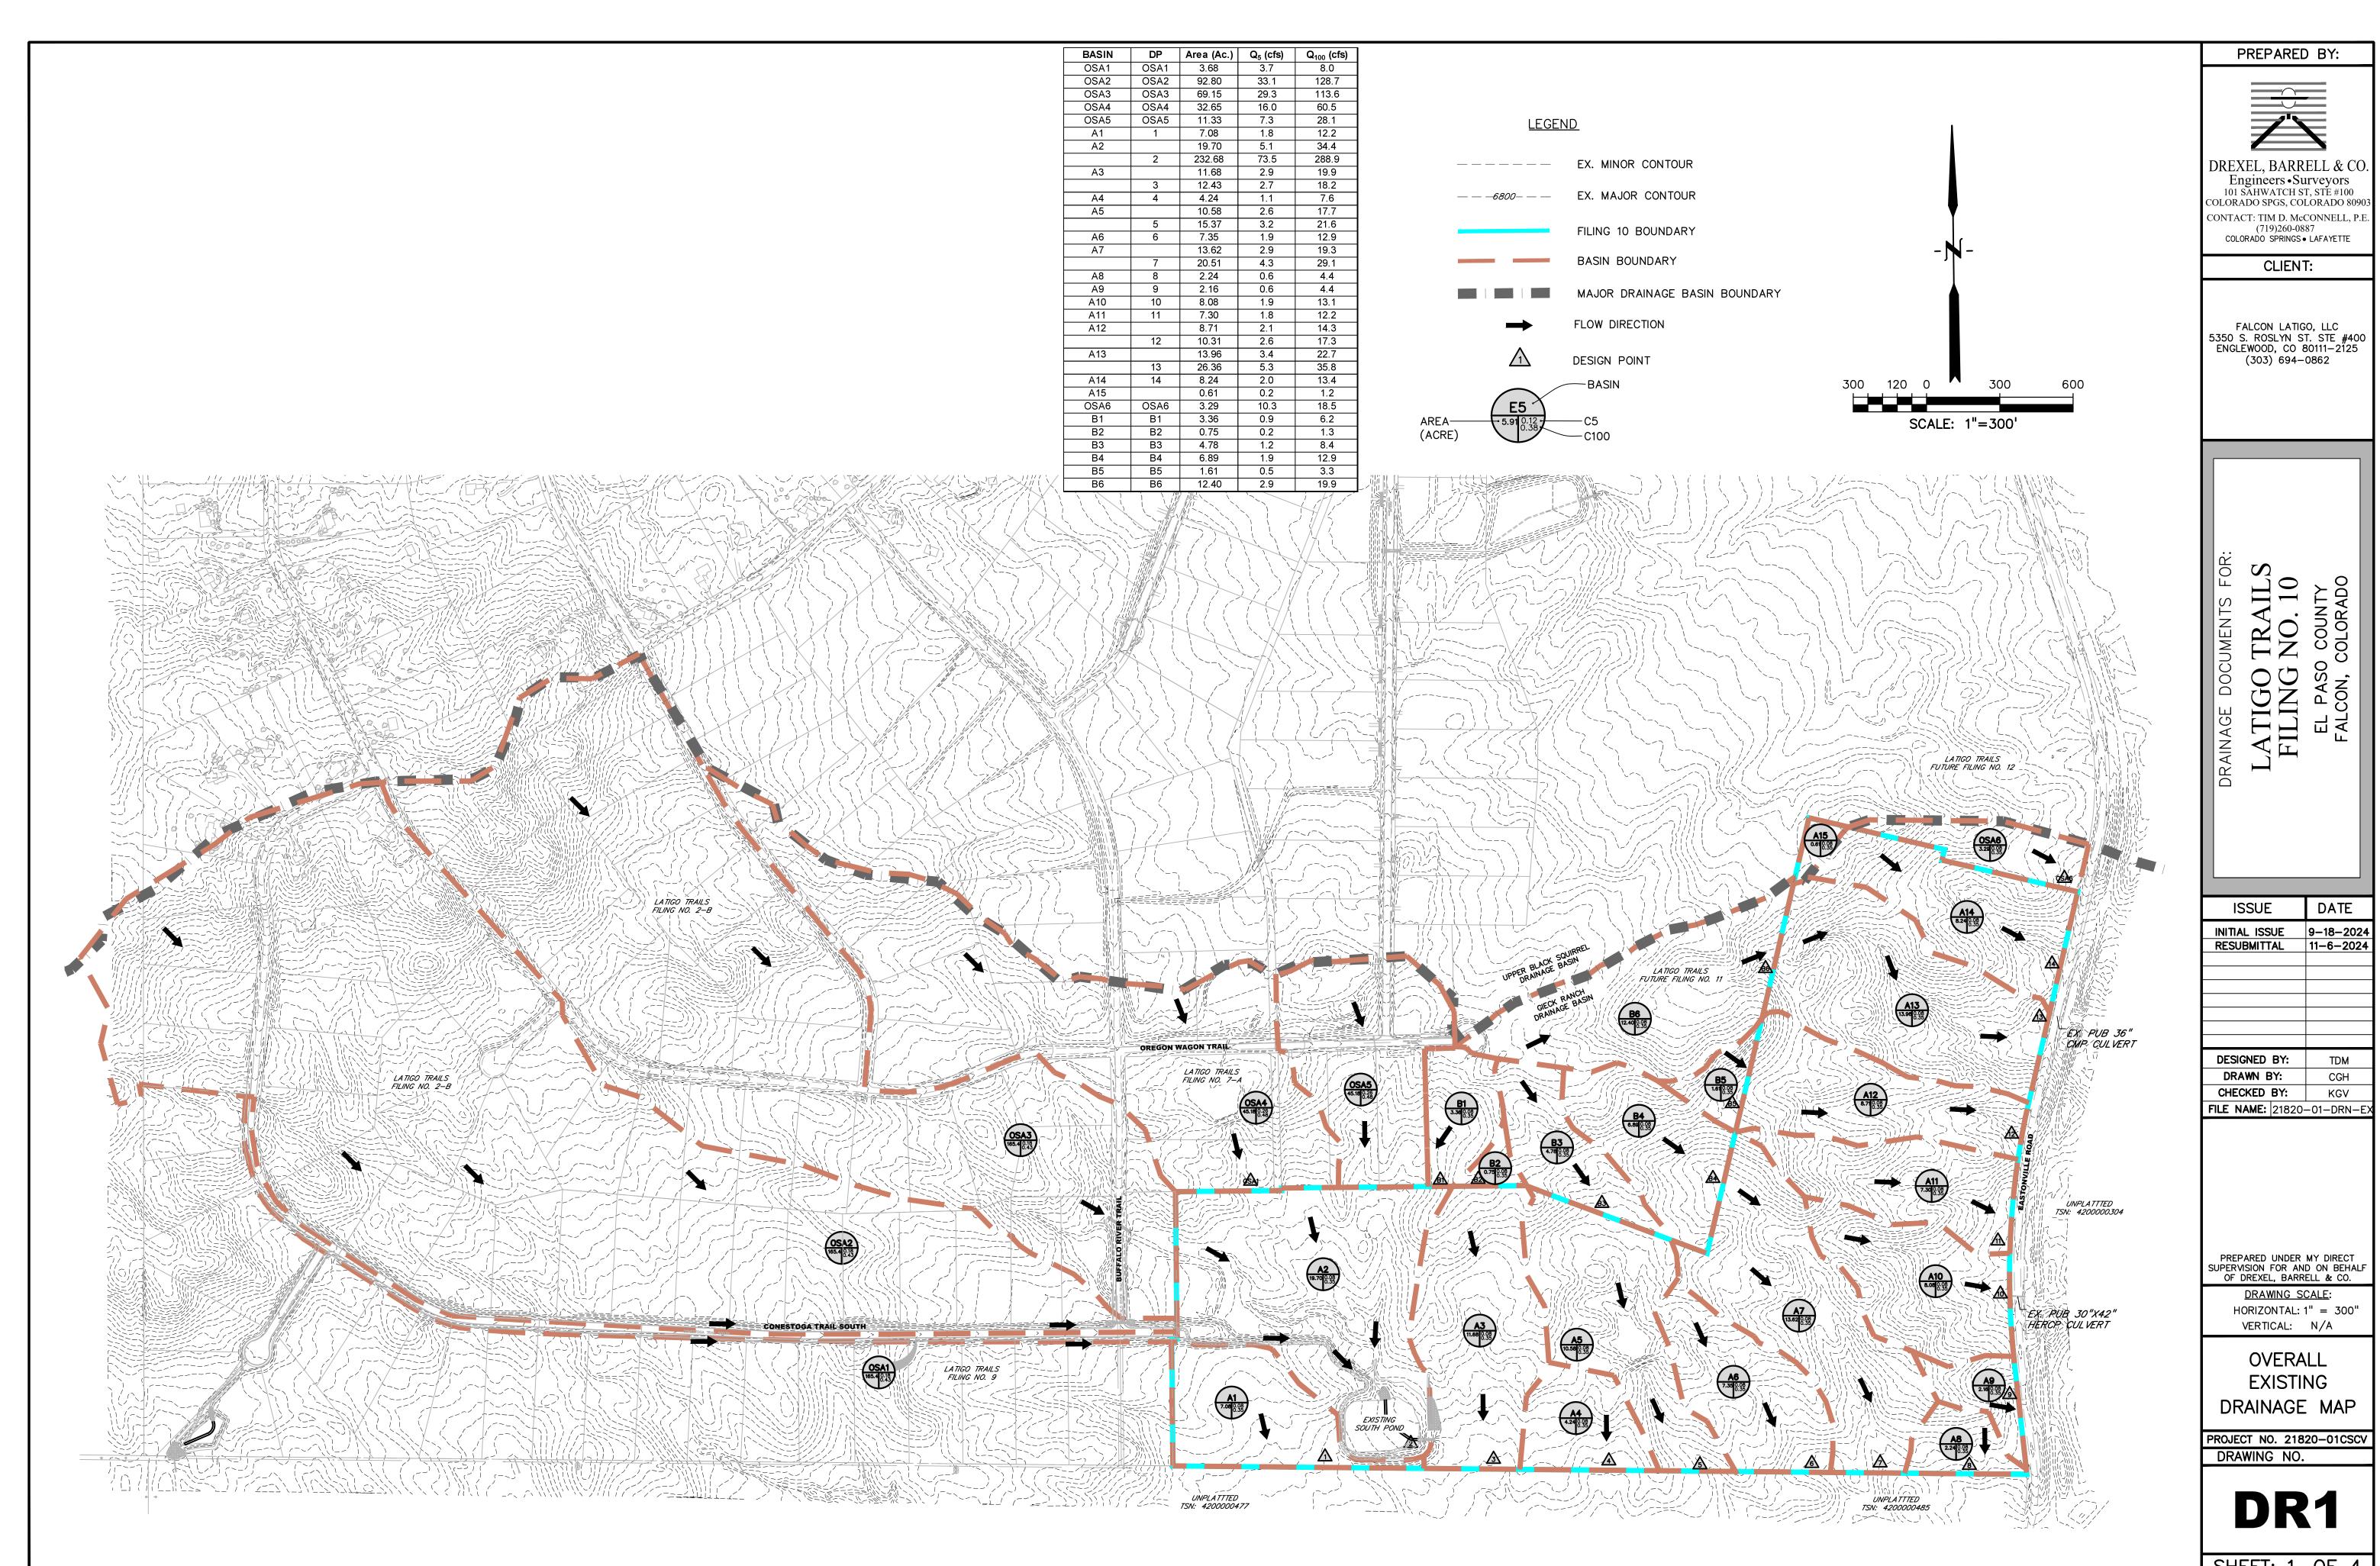

The user should graphically compare the summary S-A-V-D table to the full S-A-V-D table in the chart to confirm it captures all key transition points.

The user should graphically co	mpare the sumr	nary S-A-V-D ta	ble to the full S	-A-V-D table in t	the chart to con		all k

For best results, include the stages of all grade slope changes (e.g. ISV and Floor) from the S-A-V table on Sheet 'Basin'.

Also include the inverts of all outlets (e.g. vertical orifice, overflow grate, and spillway, where applicable).

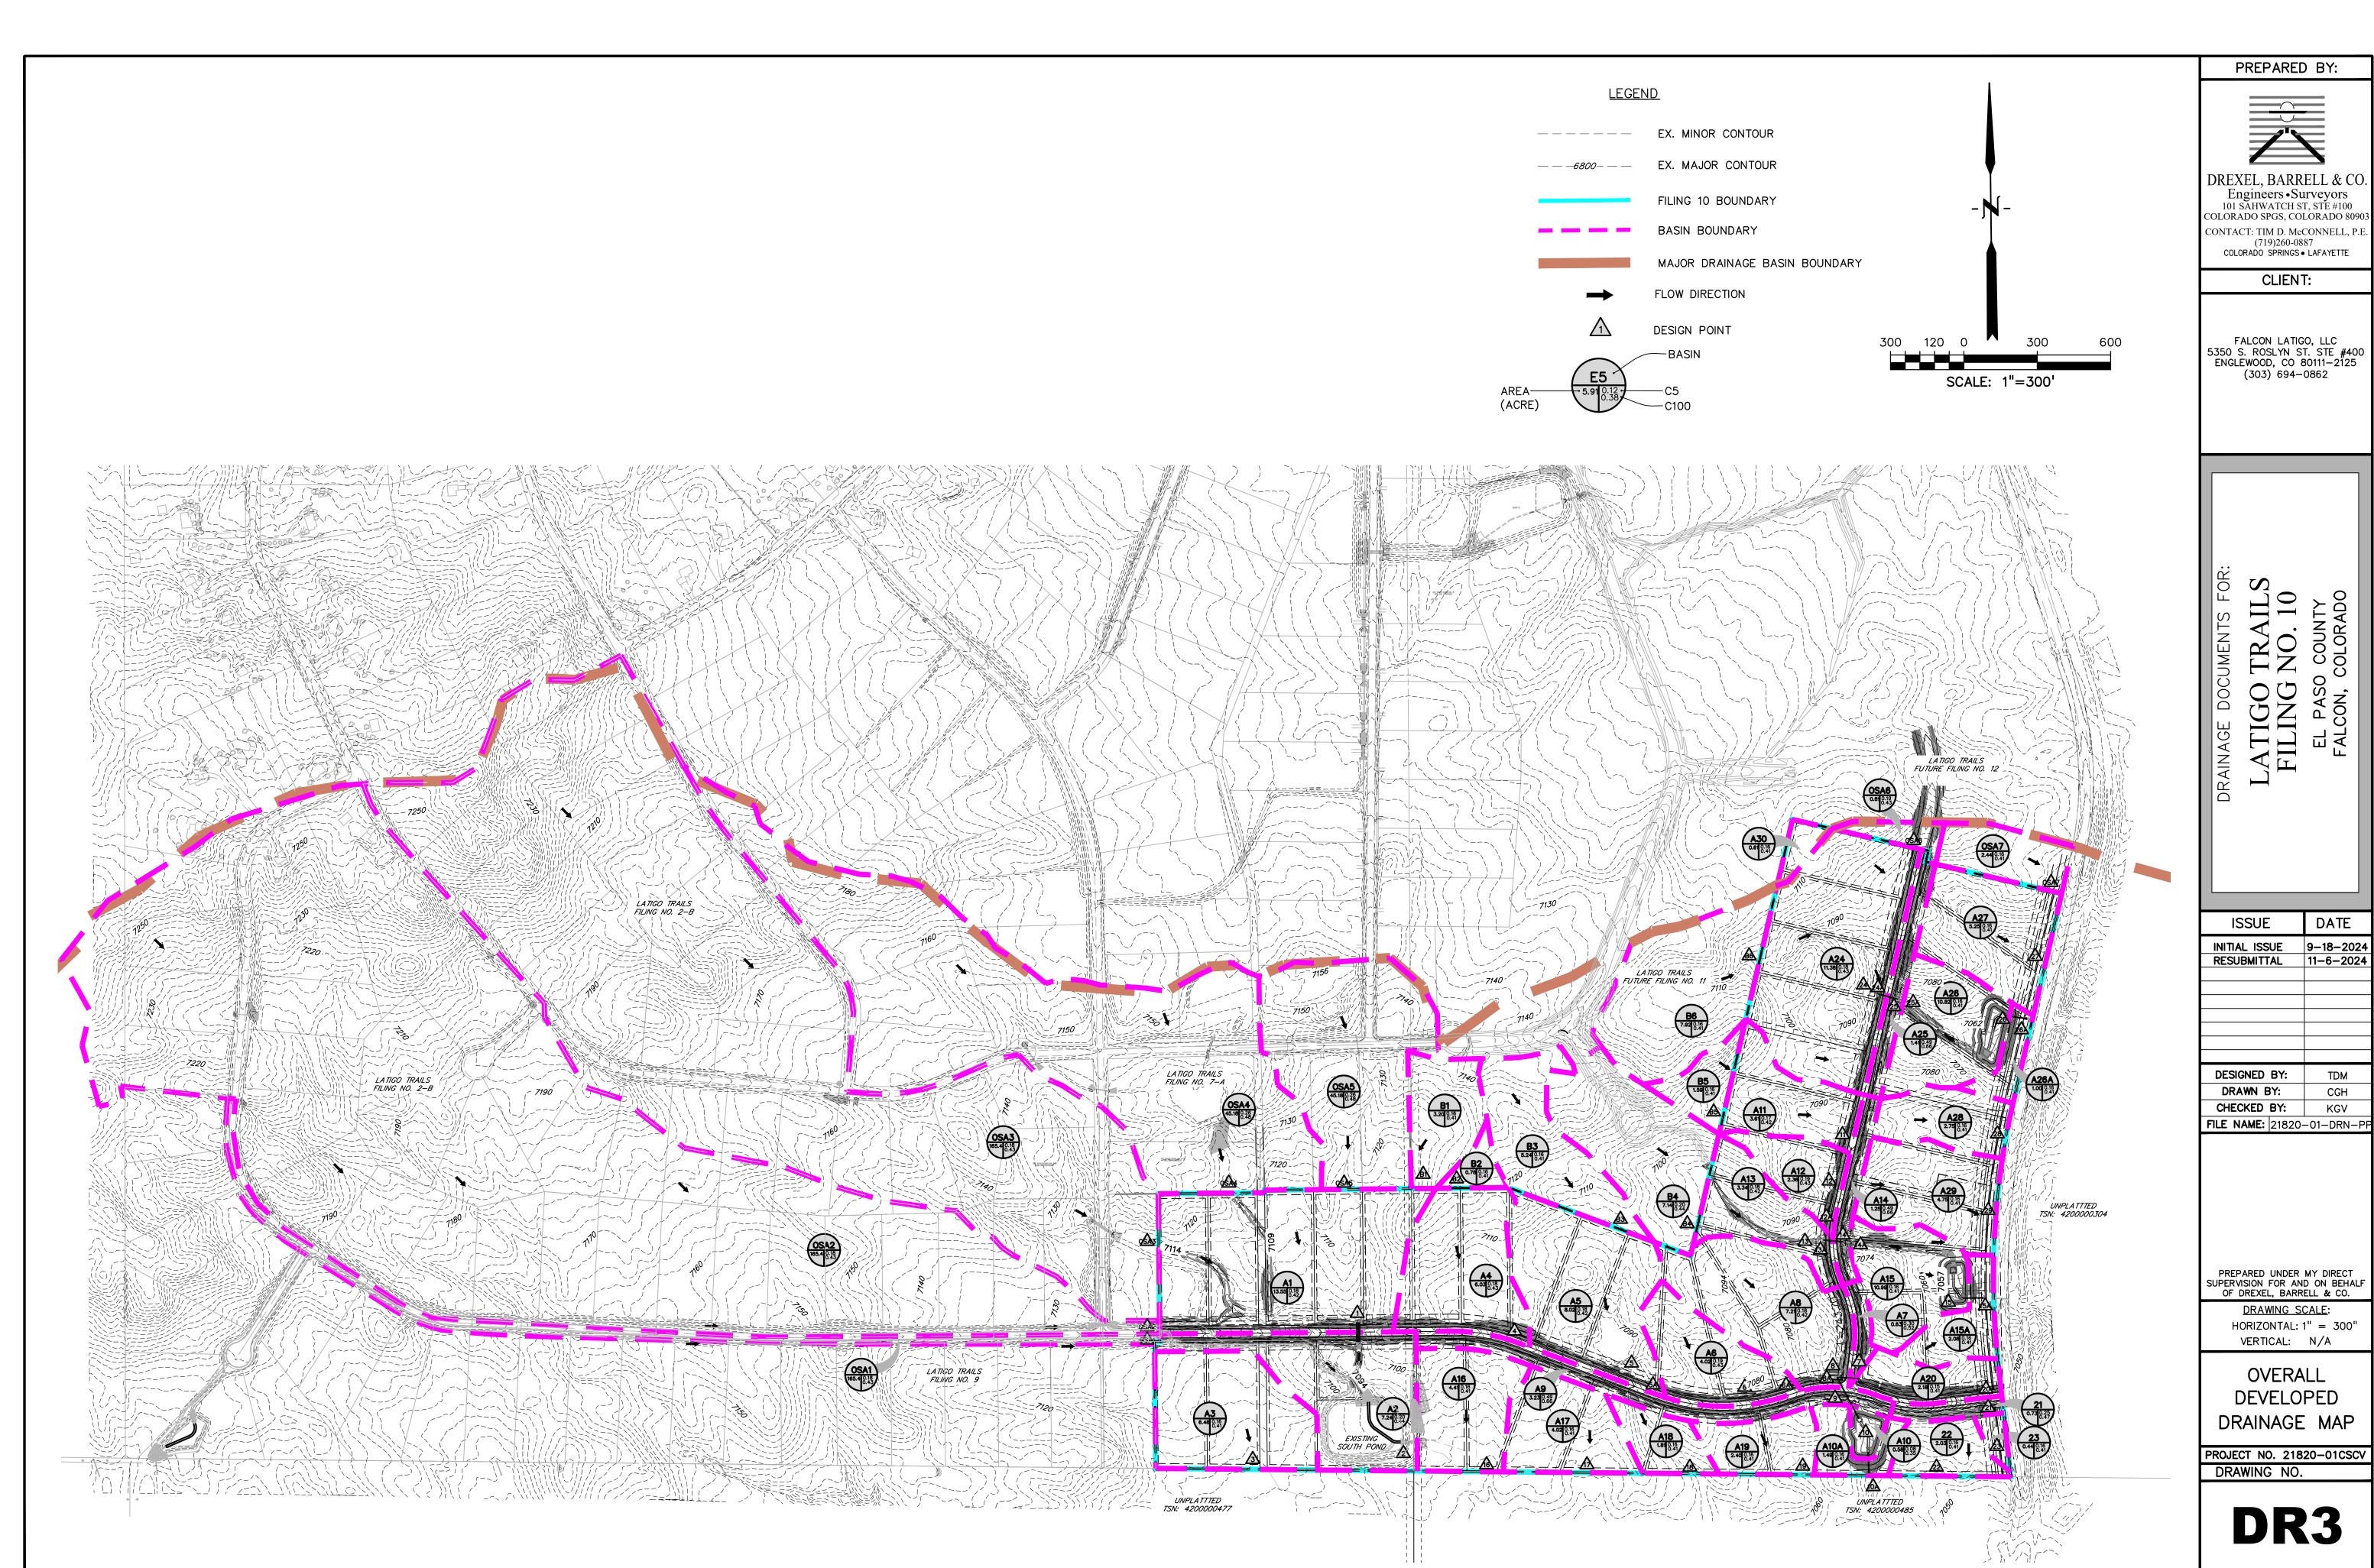

FILING 9 FDR EXCERPT

SHEET: 1 OF 4

SHEET: 2 OF 4

SHEET: 3 OF 4

We need to know how much of the proposed area of <u>disturbance</u> (not just the impervious surfaces) is treated vs untreated and if there are any exclusions that apply to the untreated areas. So please create a basic overview map (or modify an existing drainage map) with color shading/hatching that shows areas tributary to each PBMP (pond, runoff reduction, etc.) and those disturbed areas that are not treated by a PBMP, with the applicable exclusion labeled (ex: 20% up to 1ac of development can be excluded per ECM App I.7.1.C.1 (only if using the WQCV Design Base Standard) and exclusions listed in ECM App I.7.1.B.#). An accompanying summary table on this map would also be very helpful (2 examples provided):
