ENGINEERS CERTIFICATION STATEMENT:

"The attached drainage plan and report were prepared under my direction and supervision and are correct to the best of my knowledge and belief. Said drainage report has been prepared according to the criteria established by the county for drainage reports and said report is in conformity with the master plan of the drainage basin. I accept responsibility for any liability caused by and negligent acts, errors or omissions on my part in preparing this report."

SIGNATURE:_____ (Affix Seal)
Treven Edwards, PE 60124
(For and on behalf of Galloway & Company)

DEVELOPERS CERTIFICATION STATEMENT:

"I, _____ the developer have read and will comply with all of the requirements specified in this drainage report and plan."

_____	_____	
Name of Developer	Authorized Signature	Date
_____	_____	
Printed Name	Title	
_____	_____	
Address	City, State Zip	

EL PASO COUNTY ONLY:

Filed in accordance with the requirements of the Drainage Criteria Manual, Volumes 1 and 2, El Paso County Engineering Criteria Manual and Land Development Code as amended.

Joshua J. Palmer, P.E.	Date
County Engineer / ECM Administrator	

Conditions:

I. INTRODUCTION / SITE DESCRIPTION

Purpose:

This preliminary drainage report is for The Markets at Bent Grass proposed commercial development, heron referred to as "Site." The purpose of this report is to identify on and offsite drainage patterns, analyze existing and proposed hydraulic improvements required for the Site, and ensure there are no significant changes to existing drainage patterns.

Location:

The Site is identified as Parcels 5301000016, 5301000017, & 5301002007, as shown in the El Paso County Assessor map. The Site is located in a portion of the Southwest Quarter of Section 1, Township 13 South, Range 65 West of the 6th Principal Meridian, County of El Paso, State of Colorado.

The site is bounded to the north by Falcon Meadows at Bent Grass Filing No. 1 residential, to the east by Mountain View Electric Association property, to the south by Woodmen Frontage Rd. public R.O.W., and to the west by Bent Grass Meadows Dr. public R.O.W. A portion of the Falcon Drainage Basin Western Tributary Channel (**RWT210**) runs through the site, parallel to the eastern property boundary. A vicinity map is provided below for reference.

Site Description:

The site occupies approximately 53.91 acres of undeveloped land, consisting of natural low-lying vegetation, dirt stockpiles, a natural drainage ditch along the southern property boundary, and a portion of the Falcon Watershed, Western Tributary channel along the eastern property boundary. Parcel 5301000016 is currently zoned as I-2 (limited use industrial) and the remaining parcels are zoned CR (Commercial Regional). The northern parcel, 5301000016, is to be re-zoned to CR and the other parcels are to maintain their current zoning.

The site topography generally slopes from the northwest to the southeast at approximately 2.0% slope. Based on aerial and on-site observations, the site consists of native grass vegetation, with trees and large shrubs located within the southern portion of the existing channel. Existing soil piles are located on the northeast side of the site. The site is proposed to be developed into a commercial subdivision and will disturb approximately **46.41 acres** of land.

Description of Soils:

Soils can be classified in four different hydrologic groups, A, B, C, or D to help predict stormwater runoff rates. Hydrologic group "A" is characterized by deep, well-drained coarse-grained soils with a rapid infiltration rate when thoroughly wet and having a low runoff potential. Group "D" typically has a clay layer at or near to the surface, or very shallow depth to impervious bedrock and has a very slow infiltration rate and a high runoff potential. According to the Natural Resources Conservation Service (NRCS) Web Soil Survey, the project site consists of a mix of soil types and Hydrologic Soil Groups (HSGs) shown in **Table 1** below.

Table 1 – USDA NRCS Soil Data

Soil Name	HSG	Percent of Site
Blakeland-Fluvaquentic Haplaquolls	A/D	0.2%
Columbine Gravelly Sandy Loam	A	99.8%

The predominant HSG for the Site is type 'A'. A copy of the NRCS Web Soil Survey report can be found in **Appendix A** for reference.

A Geotechnical Study was prepared for the Site. The study was prepared by Vivid Engineering Group, dated 08/29/2025. According to the study, the site consists primarily of clayey to silty sand, with several test holes finding sand lean clay and silty clay at interbedded layers. Ground water during the site visit was noted to be, on average, between 7 to 12 feet below existing grade.

Floodplain Statement:

A portion of site is located within Zone AE as determined by the Flood Insurance Rate Map (FIRM) number 08041C0553G effective date, 12/7/2018 (see FIRM Panel in Appendix A).

The portion within Zone AE is contained within a drainage easement along the eastern property boundary and is not to be disturbed with this project. This drainageway is associated with the Falcon Drainage Basin Western Tributary to Black Squirrel Creek and the specific reach within the property is denoted as **RWT210** in the **DBPS**. The remainder of the site to be developed is in Zone X and is not within the 100-year floodplain.

Other Features and Encumbrances:

- No irrigation facilities were observed, or identified by the ALTA survey, on the site.
- The site is encumbered by existing utilities within easements along the southern property boundary. This easement consists of overhead power, underground fiber optic, gas, sewer, & water.
    - Relocations and/or removals of some of the utilities are being coordinated with Mountain View Electric Assoc. (MVEA) and Woodmen Hills Metro District (WHMD).
    - It is anticipated that the existing gas and fiber optic lines with remain in place.
- The site is encumbered by (3) separate drainage easements; one central to the site, running east-west, one along the southern portion following the alignment of a natural

drainage ditch, and the final located along the eastern property boundary encompassing the channel RWT210.

- The two easements running east-west through the site are to be removed as they are for public stormwater facilities that are to be re-routed as part of the project.
- The Channel easement will be replaced with a Tract that will be dedicated to the Bent Grass Metro District as they currently own and maintain this portion of the channel.

II. DESIGN CRITERIA

Reference Criteria Manuals:

The analysis and design of the drainage for the Site were prepared in accordance with the criteria set forth from the following resources:

- ***Engineering Criteria Manual County of El Paso, Colorado***, July 18, 2023 with latest updates; hereon referred to as ECM.
- ***Drainage Criteria Manual of El Paso, Colorado***, Volumes 1 & 2, October 31, 2018 with latest updates; hereon referred to as DCM.
- ***City of Colorado Springs Drainage Criteria Manual,*** Volumes 1 & 2 latest updates; hereon referred to as CS-DCM.
- ***Mile High Flood District (MHFD) Urban Storm Drainage Criteria Manual***, Volumes 1-3 latest updates; hereon referred to as USDCM.

HYDROLOGIC CRITERIA

Rainfall:

The drainage analysis is based on the DCM, Volume 1, Figure 6-5 Intensity Duration Frequency (IDF) curve (See **Appendix A**), created from NOAA Atlas 14, Volume III, Regional 1 rainfall intensity data for an elevation of 6,840-ft. However, the above rainfall methodology is not appropriate in determining the Water Quality Capture Volume (WQCV). Therefore, the MHFD USDCM methods for the WQCV are utilized.

Rational Method:

Because the drainage basins for the site are less than 130-acres, the Rational Method is utilized to determine the runoff peak discharges, which is calculated by the following formula:

$$Q = C \cdot i \cdot A \qquad \textbf{(Equation 6-5)}$$

Where:
Q = maximum rate of runoff (cubic feet per second [cfs])
C = runoff coefficient (discussed below)
I = intensity of rainfall for a duration equal to the time of concentration (inches per hour [in/hr])
A = drainage basin area [acres]

Runoff peak discharges were calculated for the 5-year and 100-year return periods, which are hereon referred to as the minor and major storm events, respectively.

Runoff Coefficient:

The rational method runoff coefficient ‘C’ is calculated for each drainage basin by using a weighted average of the land use and/or surface characteristics within a particular drainage basin, which follows the following formula:

$$C = (C_1A_1 + C_2A_2 + C_3A_3 + \ldots C_iA_i)/A_t \quad \textbf{(Equation 6-6)}$$

Where:
C = Composite runoff coefficient for the drainage basin
C_i = runoff coefficient for subarea corresponding to surface type or land use
A_i = area of surface type corresponding to C_i (Acres)
A_t = total area of all subareas for which composite runoff coefficient applies (Acres)
i = number of surface types in the drainage area

The sub-area runoff coefficient is determined from Table 6-6 of the DCM which provides values based on land use/surface characteristic, percent impervious, return period, and hydrologic soil group. A copy of the table can be found in **Appendix A** for reference.

Time of Concentration:

The Time of Concentration was calculated using the equations in the DCM, Vol.1, Sec. 3.2 as follows:

$$t_c = t_i + t_t \quad \textbf{(Equation 6-7)}$$

Where:
t_c = time of concentration [min]
t_i = overland (initial) flow time [min]
t_t = travel time of concentrated flow (i.e. ditch, curb/gutter, etc. [min])

The overland flow time, t_i, is calculated by the following equation:

$$t_i = \frac{0.395(1.1-C_5)\sqrt{L}}{S^{0.33}} \quad \textbf{(Equation 6-8)}$$

Where:
t_i = overland (initial) flow time [min]
C_5 = runoff coefficient for a 5-year return period
L = length of overland flow (300-ft max for non-urban, 100-ft max for urban)
S = average drainage basin slope [ft/ft]

The concentrated flow (or channelized flow) is calculated by the following equations:

$$V = C_v S_w^{0.5} \quad \textbf{(Equation 6-9)}$$

Where:
V = velocity (feet per second [ft/s or fps])
C_v = conveyance coefficient (see **Table 2** below)
S_w = watercourse slope [ft/ft]

$$t_t = \frac{L}{60 \cdot V}$$

Where:
t_t = travel time of concentrated flow [min]
L = length of concentrated flow [ft]
V = velocity [ft/s]

Table 2 - Conveyance coefficient (C_v) from Table 6-7 of DCM

Type of Land Surface	C_v
Heavy Meadow	2.5
Tillage/field	5
Riprap (not buried)	6.5
Short Pasture and Lawns	7
Nearly Bare Ground	10
Grassed Waterway	15
Paved areas and shallow paved swales	20

The final time of concentration (t_c) is then checked according to the following equation:

$$t_c = \frac{L}{180} + 10 \qquad \textbf{(Equation 6-10)}$$

Where:
t_c = max time of concentration at 1st design point in urban watershed [min]
L = waterway length [ft]

Where calculations result in a time less than 5-minutes, the minimum time of concentration is analyzed at 5-minutes.

HEC-HMS Model:

The United Stated Army Corps of Engineer (USACE) Hydraulic Engineering Center, Hydrologic Modeling System (HEC-HMS) was utilized in updating the major drainage basin curve number to the fully developed commercial site designation. The original model from the DBPS Amendment (discussed in more detail in Section III of this report) was obtained and modified to ensure accurate replication of the original model. A table is provided in **Appendix A** referencing CN values based on soil characteristics and site use that was utilized.

HYDRAULIC CRITERIA

Streets & Inlets:

Existing and proposed roadways & inlets were analyzed for hydraulic capacity utilizing the MHFD-Inlet *v6.00* design tool. The street and inlets were calculated for capacity based on two constraining elements:

1. The allowable Spread
2. The allowable gutter depth

For public roadways, these limiting parameters are based on roadway classification, which for Bent Grass Meadows Dr., is a collector. Figure 7-5 from the CS-DCM was utilized as it most closely reflected the R.O.W. for this site. The 8" vertical curb height is neglected as this project utilizes a 6" curb height per El Paso County standards. A copy of Figure 7.5 can be found in **Appendix A** for reference. Manning's roughness values (n) shown in the CS-DCM roadway classification figure was utilized in the software for analysis.

Inlets along roadways were also sized utilizing the MHFD-Inlet *v6.00* design tool. This tool provides capacity calculations for both 'on-grade' and 'sump' inlets. Bypass flows from the on-grade inlets are then routed to the next downstream inlet to ensure proper sizing. The design tool also includes a reduction factor to the inlet capacity based on grate type, ensuring conservative inlet size selection.

Storm Sewers:

The proposed storm sewers were not analyzed with this report. The criteria and analysis for the proposed storm sewer system will be provided with the Final Drainage Report (FDR).

Swales:

The proposed swales were not analyzed with this report. The criteria and analysis for the proposed swales will be provided with the Final Drainage Report (FDR).

Culvert:

The proposed culverts were not analyzed with this report. The criteria and analysis for the proposed culverts will be provided with the Final Drainage Report (FDR).

WATER QUALITY & DETENTION

An on-site EDB is proposed onsite to treated the WQCV for the site. This EDB was designed using the MHFD-Detention *v4.07* software is utilized in calculating the on-site required Water Quality Capture Volume (WQCV) based on the concepts provided in the MHFD USDCM Volume 3, Chapter 4. 100-Year Detention and EURV are provided downstream in the existing Regional Pond WU per the DBPS (which is discussed in further detail later in the report) and was therefore not accounted for in the proposed on-site pond calculation.

The proposed structures within the pond were not analyzed with this report. The criteria and analysis for these hydraulic structures will be provided with the Final Drainage Report (FDR).

III. PREVIOUS STUDIES

The following studies, adjacent and on-site, are referenced for offsite flows, channel improvements, and reference:

- ***Falcon Drainage Basin Planning Study (DBPS)*****,** prepared by Matrix Design Group, September 2015.
  - The site is located within subbasin **WT210** of the DBPS. Elements associated with this subbasin were utilized in the site drainage analyses.
  - Regional Pond **WU-South** is discussed. This regional facility provides EURV & 100-Year detention for the subbasin **WT210** that the site is located within. Pond was revised with Bent Grass Residential Development. Updated analysis included in Bent Grass Development MDDP & DBPS Amendment.
  - Channel flows to the existing box culvert at Woodmen Road (design point **JWT210**) was analyzed to have future peak flows of **Q_5 = 250 cfs** & **Q_{100} = 1,300 cfs**.

- ***Bent Grass Development MDDP & DBPS Amendment,*** prepared by Galloway & Company, September 2021.
  - Subbasin **WT210** was revised with this DBPS amendment into smaller subbasins. The site is located within the newly formed subbasin **WT210-S**. Subbasin area is stated to be 74.9 acres with **Q_5 = 37.2 cfs** & **Q_{100} = 116.2 cfs**. Runoff volumes were calculated to be **4.4 ac-ft** in the 5-year event and **12.4 ac-ft** in the 100-year event. The model assumed a curve number (CN) value of 70 for the future condition of this subbasin.
  - Design Point **JWT210** results for future conditions from the revised HEC-HMS analysis, the runoff results in **Q_5 = 195.7 cfs** and **Q_{100} = 1,093.7 cfs**.

  - Due to construction of channel improvements to **RWT202** & **RWT210**, in addition to water quality ponds for Falcon Meadows at Bent Grass filings, sub-regional pond SR3 was determined to no longer be required.
  - Improvements were made to Regional Pond **WU-South** to incorporate Bent Grass Residential completed build out flows. Regional pond **WU-South** revised volume was calculated to be **38.876 Ac-Ft**.

- ***Falcon Meadows at Bent Grass Channel Design & FDR***, prepared by Galloway & Company, August 2022.
  - Included as reference to note recent improvements made to **RWT202** & **RWT210**.
  - Shows the calculated Base Flood Elevations (BFE's) for the new channel and delineation of the design 1% annual chance flood hazard zone based on the new channel alignment.
  - Channel flows for 100-year event at design point **JWT210** were designed to **Q_{100} = 1,482 cfs,** matching flows from the approved LOMR No.: 03-08-0385P.

- ***Falcon Meadows at Bent Grass Filing No. 1 FDR***, prepared by Galloway & Company, September 2021.
  - Reference bypass flows from Design Points 24 & 25 in Bent Grass Meadows Dr.
  - Reference Design Point **CC** which is the total flow from Bent Grass and entire northern tributaries that enter the site through **RWT210**, of **Q_5 = 272.5 cfs** and **Q_{100} = 1,209.6 cfs**. These values are based on rational method calculations. Actual channel and regional pond **WU-South** capacities are based on results from the HEC-HMS model, which utilizes SCS Type IIa method (NRCS Curve Number Method).

- ***Latigo Business Center Filing No. 1 FDR***, prepared by Kiowa Engineering, November 2004.
  - Reference proposed subbasin 6 flows that surface flow from the D49 school site at the southwest side of Bent Grass Meadows Dr. These were calculated to be **Q_5 = 21.1 cfs** and **Q_{100} = 41.7 cfs**.

- ***Latigo Business Center Filing No. 1, Lot 1, FDR***, prepared by Colorado Design Concepts, April 2005
  - Reference proposed Design Point 11, which flows from this lot flowing directly into the existing inlets in Bent Grass Meadows Dr. These were calculated to be **Q_5 = 31.8 cfs** and **Q_{100} = 59.6 cfs**.

IV. EXISTING DRAINAGE CONDITIONS

Major Watershed:

The Site is within the ***"Falcon Drainage Basin Planning Study"*** (DBPS), prepared by Matrix Design Group, Dated September 2015. Amended by ***"Bent Grass Development MDDP & DBPS Amendment"*** Galloway & Company, LLC, Dated September 2021. Specific elements for the site from these studies were outlined in the previous section.

Existing Drainage Basins:

Existing topography generally slopes from the northwest to the southeast at approximately 2.0%. On-site flows are conveyed to the existing public concrete box culvert that crosses under Woodmen Rd., located at the southeast corner of the site. Off-site flows from the north are conveyed through the site via the existing channel (**RWT210**) as noted in the Falcon DBPS. Additional off-site flows from the west are routed through the site, via drainage swales located within existing easements, to the existing channel on the east side of the site.

Drainage sub-basins in their current condition have been analyzed and denoted as ***"BG"*** for portions of Bent Grass Meadows Drive, ***"WF"*** for portions of Woodmen Frontage Rd., and ***"EX"*** for on-site basins. Results from hydrologic computations can be found in **Appendix B.** An existing conditions drainage map has been provided in **Appendix F** and can be used to reference the basins discussed below:

Design Point B3 (Q_5 = 31.8 cfs, Q_{100} = 59.6 cfs): This design point is located off-site, at the Southeast corner of Lot 1, Latigo Business Center Filing No. 1 (i.e. self storage facility). This design point represents the flows entering the existing 15' Type 'R' public inlet, via a 24" private RCP storm pipe, on the west side of Bent Grass Meadows Drive, represented as **Design Point B4** in this report. Flow values were taken from the drainage report titled "*Final Drainage Letter Report for Lot 1, Latigo Business Center Filing No. 1,"* prepared by Colorado Design Concepts, dated April 2005. The flows utilized are annotated as Design Point 11 in said report.

Basin BG-1 (0.80 ac, Q_5 = 2.4 cfs, Q_{100} = 4.8 cfs): a sub-basin defining the western half of Bent Grass Meadows Dr., adjacent to Lot 1, Latigo Business Center Filing No. 1 (i.e. self storage facility). This basin consists of existing roadway, sidewalk, and landscape. Runoff from this basin sheet flows to the gutter and is then conveyed to the south. Gutter flows are then captured by an existing, on-grade, 15' Type 'R' public inlet at **Design Point B4**.

Basin BG-2 (0.76 ac, Q_5 = 2.3 cfs, Q_{100} = 4.5 cfs): a sub-basin defining the eastern half of Bent Grass Meadows Dr., adjacent to Lot 1, Latigo Business Center Filing No. 1 (i.e. self storage facility). This basin consists of existing roadway, sidewalk, and landscape. Runoff from this basin sheet flows to the gutter and is then conveyed to the south. Gutter flows are then captured by an existing, on-grade, 20' Type 'R' public inlet at **Design Point B5**.

Design Point B6 (Q_5 = 36.5 cfs, Q_{100} = 70.3 cfs): This design point represents to combined flows entering the existing storm drain manhole, south of Design Point B5. Contributing flows to this point are Design Points B3, B4, and B5. Flows are then conveyed, via a 36" RCP public storm pipe. The conveyed flows are discharged from an FES into a drainage swale within **Basin EX-1**. The flows are then conveyed across the site, eastward, to the existing channel **RWT210**.

Basin BG-3 (1.00 ac, Q_5 = 2.9 cfs, Q_{100} = 5.7 cfs): a sub-basin defining the western half of Bent Grass Meadows Dr., adjacent to Lot 2, Latigo Business Center Filing No. 1 (i.e. Falcon School District Facility). This basin consists of existing roadway, sidewalk, and landscape. Runoff from this basin sheet flows to the gutter and is then conveyed to the south. Gutter flows are then captured by an existing, sump, 10' Type 'R' public inlet at **Design Point B7**.

Basin BG-4 (0.96 ac, Q_5 = 2.7 cfs, Q_{100} = 5.4 cfs): a sub-basin defining the eastern half of Bent Grass Meadows Dr., adjacent to Lot 2, Latigo Business Center Filing No. 1 (i.e. Falcon School District Facility). This basin consists of existing roadway, sidewalk, and landscape. Runoff from this basin sheet flows to the gutter and is then conveyed to the south. Gutter flows are then captured by an existing, sump, 5' Type 'R' public inlet at **Design Point B8**.

Basin EX-1 (42.96 ac, Q_5 = 11.3 cfs, Q_{100} = 76.1 cfs): a sub-basin defining the western portion of the site. This basin consists of undeveloped, native vegetation, with two soil piles and a natural drainage way running east-west along the southern property line. Runoff from this basin generally flows southeast, where it then discharges into the existing channel (**RWT210**) at **Design Point O1**.

Basin EX-2 (10.95 ac, Q_5 = 3.6 cfs, Q_{100} = 21.1 cfs): a sub-basin defining the eastern portion of the site. This basin consists of the existing channel (**RWT210**) identified in the Falcon DBPS discussed earlier in this report. Runoff from this basin generally flows south, within the channel, to the existing 20-foot public box culvert that runs under Woodmen Rd. at **Design Point WT.** Flows are ultimately conveyed south, within the channel at the outfall of the culvert, to **Regional Pond WU.**

Basin WF-1 (0.41 ac, Q_5 = 1.8 cfs, Q_{100} = 3.3 cfs): a sub-basin defining a portion of the Woodmen Frontage Rd. south of Lot 2, Latigo Business Center Filing No. 1 (i.e. Falcon School District Facility). This basin was analyzed to compare flows to the existing CDOT Type 'C' public inlet, at **Design Point O2**, to those in the developed condition. This basin consists of existing roadway and vegetated roadside ditch. Runoff sheet flows to the vegetated roadside ditch, where it is then conveyed either east or west to the existing CDOT Type 'C' public inlet, at **Design Point O2.** Flows captured by this inlet are then routed south, under Woodmen Rd., into a roadside ditch along the south side of Woodmen Rd. The channelized flows are then routed east, eventually discharging into channel **RWT232**.

Design Point F1 (Q_5 = 21.1 cfs, Q_{100} = 41.7 cfs): This design point is located off-site, at the Southeast corner of Lot 2, Latigo Business Center Filing No. 1 (i.e. Falcon School District Facility). This design point represents the flows entering the existing concrete cross pan at the intersection of Bent Grass Meadows Dr. & Woodmen Frontage Rd. Flow values were taken from the drainage report titled "*Final Drainage Report and Erosion Control Plan for Latigo Business Center Filing No. 1,"* prepared by Kiowa Engineering Corp., dated November 30, 2004. The flows utilized are annotated as Sub-basin 6 in said report.

Basin WF-2 (0.32 ac, Q_5 = 1.4 cfs, Q_{100} = 2.6 cfs): a sub-basin defining the portion of Woodmen Frontage Rd. at the intersection of Bent Grass Meadows Dr., adjacent to Lot 2, Latigo Business Center Filing No. 1 (i.e. Falcon School District Facility). This basin consists of existing roadway, and landscape. Runoff from this basin sheet flows to the existing concrete cross pan along the north side of the road. Flows are then conveyed east, to an existing rip-rap rundown at **Design Point F2.**

Design Point F2 (Q_5 = 22.5 cfs, Q_{100} = 44.3 cfs): This design point is located at the northeast corner of **Basin WF-2** and represents the combined flows entering the existing rip-rap rundown. Contributing flows to this point are **Design Point F1**, and **Basin WF-2**. Flows are conveyed down the existing rip-rap rundown to the existing drainage swale at **Design Point BF**.

Design Point BF (Q_5 = 28.2 cfs, Q_{100} = 55.5 cfs): This design point is located at the southwest corner of **Basin EX-1** and represents the combined off-site flows entering the existing channel on the southern portion of the site. Contributing flows to this point are **Design Points B8** and **F2**. Flows are conveyed east, within the existing drainage swale, to the existing channel (**RWT210**) at **Design Point O1**.

Basin WF-3 (0.80 ac, Q_5 = 1.6 cfs, Q_{100} = 4.0 cfs): a sub-basin defining the north half of Woodmen Frontage Rd. adjacent to the southern property boundary of the site. This basin consists of existing roadway and landscape. Runoff from this basin sheet flows north, onto the site, within **Basins EX-1** & **EX-2**. Flows are ultimately routed to **Design Point WT**, within the existing channel (**RWT210**).

Design Point O1 (Q_5 = 77.7 cfs, Q_{100} = 206.0 cfs): This design point is located at the southeast corner of **Basin EX-1** and represents the combined flows entering the existing channel (**RWT210**). Contributing flows to this point are **Design Points B6**, **BF**, and **Basins EX-1** & **WF-3**.

Design Point CC (Q_5 = 272.5 cfs, Q_{100} = 1,209.6 cfs): This design point is located off-site, at the northeast corner of the site. This design point represents the off-site flows entering the site, represented as **Basin EX-2** in this report, through the existing channel (**RWT210**). Flow values were taken from the drainage report titled "*Final Drainage Report for Falcon Meadows at Bent Grass Filing No. 1,"* prepared by Galloway & Company, LLC, dated September 2021. The flows utilized are annotated as Design Point CC in said report.

Design Point WT (Q_5 = 353.8 cfs, Q_{100} = 1,436.7 cfs): This design point is located at the south end of **Basin EX-2** and represents the combined flows entering the existing 20-foot public box culvert, conveying flows under Woodmen Rd. Contributing flows to this point are Design Point CC, O1, and Basin EX-2. Flows are ultimately conveyed south, within the channel at the outfall of the culvert, to **Regional Pond WU.**

Basin WF-4 (1.03 ac, Q_5 = 2.1 cfs, Q_{100} = 4.3 cfs): a sub-basin defining the south half of Woodmen Frontage Rd. adjacent to the southern property boundary of the site. This basin was analyzed to compare flows, that continue east within the existing roadside ditch, at **Design Point O3**, to those in the developed condition. This basin consists of existing roadway and vegetated roadside ditch. Runoff sheet flows to the vegetated roadside ditch, where it is then conveyed east, past the scope of this sites improvements, at **Design Point O3.**

V. PROPOSED DRAINAGE CONDITIONS

Proposed Drainage Basins:

Drainage sub-basins in their proposed condition have been analyzed and denoted as ***"BG"*** for portions of Bent Grass Meadows Drive, ***"WF"*** for portions of Woodmen Frontage Rd., ***"WA"*** for the proposed connection to Woodmen Rd., ***"RD"*** for private internal roads, ***"L"*** for proposed lots, and ***"T"*** for proposed tracts. Computations and results of the sub-basins hydrology can be found in **Appendix B.** A proposed conditions drainage map has been provided in **Appendix F** and can be used to reference the basins discussed below.

Some sub-basins and design points remain unchanged from the existing condition and as a result, their descriptions are not included in this section. This includes Basins: **BG-1**, **BG-2**; and Design Points: **B3**, **CC**, and **F1**.

Basin BG-3A (0.46 ac, Q_5 = 1.5 cfs, Q_{100} = 3.0 cfs): a sub-basin defining the existing western half of Bent Grass Meadows Dr., adjacent to Lot 2, Latigo Business Center Filing No. 1 (i.e. Falcon School District Facility). This basin consists of existing roadway, sidewalk, and landscape. Runoff from this basin sheet flows to the gutter and is then conveyed to the south. Gutter flows are then conveyed to **Basin BG-3B**, the realigned segment of Bent Grass Meadows Dr. These flow ultimately are conveyed to a proposed, sump, 5-ft Type 'R' public inlet at **Design Point B8**.

Basin BG-3B (0.74 ac, Q_5 = 2.2 cfs, Q_{100} = 4.5 cfs): a sub-basin defining the south half of the newly aligned segment of Bent Grass Meadows Dr., west of the proposed roundabout. This basin consists of proposed roadway, sidewalk, and landscape. Runoff from this basin sheet flows to the gutter and is then conveyed to a proposed, sump, 5-ft Type 'R' inlet at **Design Point B8**. In the case that the inlet becomes clogged, flows will overtop the crown and drain to **Design Point B9**.

Basin BG-4A (0.49 ac, Q_5 = 1.6 cfs, Q_{100} = 3.2 cfs): a sub-basin defining the existing eastern half of Bent Grass Meadows Dr., adjacent to Lot 2, Latigo Business Center Filing No. 1 (i.e. Falcon School District Facility). This basin consists of existing roadway, sidewalk, and landscape. Runoff from this basin sheet flows to the gutter and is then conveyed to the south. Gutter flows are then conveyed to **Basin BG-4B**, the realigned segment of Bent Grass Meadows Dr. These flow ultimately are conveyed to a proposed, sump, 10-ft Type 'R' public inlet at **Design Point B9**.

Basin BG-4B (0.83 ac, Q_5 = 2.8 cfs, Q_{100} = 5.6 cfs): a sub-basin defining the north half of the newly aligned segment of Bent Grass Meadows Dr., west of the proposed roundabout, and a portion of the proposed private road on the north arm of the roundabout. This basin consists of proposed roadway, sidewalk, and landscape. Runoff from this basin sheet flows to the gutter and is then conveyed to a proposed, sump, 10-ft Type 'R' inlet at **Design Point B9**. In the case that the inlet becomes clogged, flows will overtop the crown and drain to **Design Point B8**.

Basin BG-5 (0.21 ac, Q_5 = 0.8 cfs, Q_{100} = 1.6 cfs): a sub-basin defining the south half of the newly aligned segment of Bent Grass Meadows Dr., east of the proposed roundabout. This basin consists of proposed roadway, sidewalk, and landscape. Runoff from this basin sheet flows to the gutter and is then conveyed to a proposed, at-grade, 5-ft Type 'R' inlet at **Design Point B11**.

Basin BG-6 (0.55 ac, Q_5 = 2.0 cfs, Q_{100} = 3.9 cfs): a sub-basin defining the north half of the newly aligned segment of Bent Grass Meadows Dr., east of the proposed roundabout. This basin consists of proposed roadway, sidewalk, and landscape. Runoff from this basin sheet flows to the gutter and is then conveyed to a proposed, at-grade, 10-ft Type 'R' inlet at **Design Point B12**.

Basin BG-7 (0.24 ac, Q_5 = 0.8 cfs, Q_{100} = 1.6 cfs): a sub-basin defining the south half of the newly aligned segment of Bent Grass Meadows Dr., east of the proposed roundabout, that ties back into Woodmen Frontage Rd. prior to the existing box culvert for **RWT210**. This basin consists of proposed roadway, sidewalk, and landscape. Runoff from this basin sheet flows to the gutter and is then conveyed off-site, to the existing roadside ditch, at **Design Point O3** following existing drainage patterns to the east.

Basin BG-8 (0.30 ac, Q_5 = 0.8 cfs, Q_{100} = 1.7 cfs): a sub-basin defining the north half of the newly aligned segment of Bent Grass Meadows Dr., east of the proposed roundabout, that ties back into Woodmen Frontage Rd. prior to the existing box culvert for **RWT210**. This basin consists of proposed roadway, sidewalk, and landscape. Runoff from this basin sheet flows to the gutter and is then conveyed to the existing channel **RWT210**, at **Design Point WT** following existing drainage patterns to the east.

Basin L-1A (1.48 ac, Q_5 = 5.8 cfs, Q_{100} = 10.6 cfs): a sub-basin defining the northwest corner of Lot 1. The final use and layout of this basin is unknown at this time and was therefore calculated as a commercial development. A separate drainage report or letter will be required at the time of this lots development. Runoff from this basin was accounted for in the private storm sewer system at **Design Point W2**.

Basin L-1B (4.29 ac, Q_5 = 16.1 cfs, Q_{100} = 29.4 cfs): a sub-basin defining the west half of Lot 1, excluding **Basin L-1A**. The final use and layout of this basin is unknown at this time and was therefore calculated as a commercial development. A separate drainage report or letter will be required at the time of this lots development. Runoff from this basin was accounted for in the private storm sewer system at **Design Point W10**.

Basin L-1C (4.84 ac, Q_5 = 17.4 cfs, Q_{100} = 31.8 cfs): a sub-basin defining the east half of Lot 1. The final use and layout of this basin is unknown at this time and was therefore calculated as a commercial development. A separate drainage report or letter will be required at the time of this lots development. Runoff from this basin was accounted for in the private storm sewer system at **Design Point E4**.

Basin L-1D (0.75 ac, Q_5 = 0.3 cfs, Q_{100} = 2.2 cfs): a sub-basin defining an eastern portion of Lot 1. This area consists of landscape area that will catch grade down to the existing channel. This area will remain pervious once it is developed. A separate drainage report or letter will be required at the time of this lots development. Runoff from this basin sheet flows directly in to the adjacent channel and is accounted for under **Design Point O1.**

Basin L-2A (4.11 ac, Q_5 = 16.6 cfs, Q_{100} = 30.3 cfs): a sub-basin defining the west half of Lot 2. The final use and layout of this basin is unknown at this time and was therefore calculated as a commercial development. A separate drainage report or letter will be required at the time of this lots development. Runoff from this basin was accounted for in the private storm sewer system at **Design Point W1**.

Basin L-2B (4.55 ac, Q_5 = 19.0 cfs, Q_{100} = 34.6 cfs): a sub-basin defining the east half of Lot 2. The final use and layout of this basin is unknown at this time and was therefore calculated as a commercial development. A separate drainage report or letter will be required at the time of this lots development. Runoff from this basin was accounted for in the private storm sewer system at **Design Point E1**.

Basin L-2C (0.78 ac, Q_5 = 3.3 cfs, Q_{100} = 6.0 cfs): a sub-basin defining the northeastern half of Lot 2. The final use and layout of this basin is unknown at this time and was therefore calculated as a commercial development. A separate drainage report or letter will be required at the time of this lots development. Runoff from this is captured at the proposed private COS Type 3 Combo Inlets at **Design Point W4.**

Basin L-3 (1.03 ac, Q_5 = 4.3 cfs, Q_{100} = 7.9 cfs): a sub-basin defining Lot 3. The final use and layout of this basin is unknown at this time and was therefore calculated as a commercial development. A separate drainage report or letter will be required at the time of this lots development. Runoff from this basin was accounted for in the private storm sewer system at **Design Point W5**.

Basin L-4 (1.09 ac, Q_5 = 4.5 cfs, Q_{100} = 8.3 cfs): a sub-basin defining Lot 4. The final use and layout of this basin is unknown at this time and was therefore calculated as a commercial development. A separate drainage report or letter will be required at the time of this lots development. Runoff from this basin was accounted for in the private storm sewer system at **Design Point W7**.

Basin L-5 (0.73 ac, Q_5 = 3.1 cfs, Q_{100} = 5.6 cfs): a sub-basin defining Lot 5. The final use and layout of this basin is unknown at this time and was therefore calculated as a commercial development. A separate drainage report or letter will be required at the time of this lots development. Runoff from this basin was accounted for in the private storm sewer system at **Design Point W9**.

Basin L-6 (0.77 ac, Q_5 = 3.2 cfs, Q_{100} = 5.9 cfs): a sub-basin defining Lot 6. The final use and layout of this basin is unknown at this time and was therefore calculated as a commercial development. A separate drainage report or letter will be required at the time of this lots development. Runoff from this basin was accounted for in the private storm sewer system at **Design Point W11**.

Basin L-7 (0.70 ac, Q_5 = 2.9 cfs, Q_{100} = 5.4 cfs): a sub-basin defining Lot 7. The final use and layout of this basin is unknown at this time and was therefore calculated as a commercial development. A separate drainage report or letter will be required at the time of this lots development. Runoff from this basin was accounted for in the private storm sewer system at **Design Point W12**.

Basin L-8 (1.00 ac, Q_5 = 4.2 cfs, Q_{100} = 7.6 cfs): a sub-basin defining Lot 8. The final use and layout of this basin is unknown at this time and was therefore calculated as a commercial development. A separate drainage report or letter will be required at the time of this lots development. Runoff from this basin was accounted for in the private storm sewer system at **Design Point W14**.

Basin L-9 (0.94 ac, Q_5 = 3.9 cfs, Q_{100} = 7.2 cfs): a sub-basin defining Lot 9. The final use and layout of this basin is unknown at this time and was therefore calculated as a commercial development. A separate drainage report or letter will be required at the time of this lots development. Runoff from this basin was accounted for in the private storm sewer system, via a pipe connection, at **Design Point W16**.

Basin L-10 (0.56 ac, Q_5 = 2.3 cfs, Q_{100} = 4.3 cfs): a sub-basin defining Lot 10. The final use and layout of this basin is unknown at this time and was therefore calculated as a commercial development. A separate drainage report or letter will be required at the time of this lots development. Runoff from this basin was accounted for in the private storm sewer system at **Design Point W18**.

Basin L-11 (0.62 ac, Q_5 = 2.6 cfs, Q_{100} = 4.8 cfs): a sub-basin defining Lot 11. The final use and layout of this basin is unknown at this time and was therefore calculated as a commercial development. A separate drainage report or letter will be required at the time of this lots development. Runoff from this basin was accounted for in the private storm sewer system at **Design Point W17**.

Basin L-12A (2.11 ac, Q_5 = 8.5 cfs, Q_{100} = 15.7 cfs): a sub-basin defining developable portions of Lot 12. The final use and layout of this basin is unknown at this time and was therefore calculated as a commercial development. A separate drainage report or letter will be required at the time of this lots development. Runoff from this basin was accounted for in the private storm sewer system at **Design Point E6**.

Basin L-12B (0.24 ac, Q_5 = 0.1 cfs, Q_{100} = 0.8 cfs): a sub-basin defining undevelopable portions of Lot 12 that tie the finish grade down to the existing channel. This basin will remain pervious once the lot is fully developed. A separate drainage report or letter will be required at the time of this lots development. Runoff from this basin sheet flows directly in to the existing channel and was accounted for at **Design Point O1**.

Basin L-13A (1.25 ac, Q_5 = 5.2 cfs, Q_{100} = 9.5 cfs): a sub-basin defining developable portions of Lot 13. The final use and layout of this basin is unknown at this time and was therefore calculated as a commercial development. A separate drainage report or letter will be required at the time of this lot's development. Runoff from this basin was accounted for in the private storm sewer system at **Design Point B8**.

Basin L-13B (0.13 ac, Q_5 = 0.1 cfs, Q_{100} = 0.4 cfs): a sub-basin defining undevelopable portions of Lot 13. This basin consists of pervious area that catch grade down to the proposed roadside channel within **Basin WF-3**. A separate drainage report or letter will be required at the time of this lots development. Runoff from this basin sheet flows directly in to the proposed roadside channel and was accounted for at **Design Point F3**.

Basin L-14A (1.34 ac, Q_5 = 5.6 cfs, Q_{100} = 10.2 cfs): a sub-basin defining developable portions of Lot 14. The final use and layout of this basin is unknown at this time and was therefore calculated as a commercial development. A separate drainage report or letter will be required at the time of this lot's development. Runoff from this basin was accounted for in the private storm sewer system at **Design Point B7**.

Basin L-14B (0.37 ac, Q_5 = 0.2 cfs, Q_{100} = 1.1 cfs): a sub-basin defining undevelopable portions of Lot 14. This basin consists of pervious area that catch grade down to the proposed roadside channel within **Basin WF-3**. A separate drainage report or letter will be required at the time of this lots development. Runoff from this basin sheet flows directly in to the proposed roadside channel and was accounted for at **Design Point F3**.

Basin RD-1 (0.19 ac, Q_5 = 0.6 cfs, Q_{100} = 1.2 cfs): a sub-basin defining a portion of the north half of a proposed private road, located at the southeast corner of Lot 2. This basin consists of roadway, sidewalk, and landscape. Runoff from this basin sheet flows to the proposed curb & gutter, where it is then conveyed to a proposed, sump, COS Type 3 private curb inlet at **Design Point E1**. In the case that the inlet becomes clogged, flows will overtop the crown and drain to **Design Point E2**.

Basin RD-2 (0.27 ac, Q_5 = 1.2 cfs, Q_{100} = 2.3 cfs): a sub-basin defining a portion of the south half of a proposed private road, located at the northeast corner of Lot 1. This basin consists of roadway, sidewalk, and landscape. Runoff from this basin sheet flows to the proposed curb & gutter, where it is then conveyed to a proposed, sump, COS Type 3 private pan inlet at **Design Point E2**. In the case that the inlet becomes clogged, flows will overtop the crown and drain to **Design Point E1**.

Basin RD-3 (0.22 ac, Q_5 = 0.7 cfs, Q_{100} = 1.4 cfs): a sub-basin defining a portion of the north half of a proposed private road, located at the southwest corner of Lot 2. This basin consists of roadway, sidewalk, and landscape. Runoff from this basin sheet flows to the proposed curb & gutter, where it is then conveyed to a proposed, sump, COS Type 3 private curb inlet at **Design Point W1**. In the case that the inlet becomes clogged, flows will overtop the crown and drain to **Design Point W2**.

Basin RD-4 (0.22 ac, Q_5 = 0.7 cfs, Q_{100} = 1.4 cfs): a sub-basin defining a portion of the south half of a proposed private road, located at the northwest corner of Lot 1. This basin consists of roadway, sidewalk, and landscape. Runoff from this basin sheet flows to the proposed curb & gutter, where it is then conveyed to a proposed, sump, COS Type 3 private curb inlet at **Design Point W2**. In the case that the inlet becomes clogged, flows will overtop the crown and drain to **Design Point W1**.

Basin RD-5 (0.40 ac, Q_5 = 1.2 cfs, Q_{100} = 2.6 cfs): a sub-basin defining portions of the private internal roadways located in the northwestern portion of the site adjacent to Lot 3. This basin consists of roadway, sidewalk, and landscape. Runoff from this basin sheet flows to the proposed curb & gutter, where it is then conveyed to a proposed, at-grade, COS Type 3 private curb inlet at **Design Point W4**.

Basin RD-6 (0.63 ac, Q_5 = 2.8 cfs, Q_{100} = 5.1 cfs): a sub-basin defining portions of the private internal roadways located in the northwestern portion of the site adjacent to Lots 3 & 4. This basin consists of roadway, sidewalk, and landscape. Runoff from this basin sheet flows to the proposed curb & gutter, where it is then conveyed to a proposed, at-grade, COS Type 3 private curb inlet at **Design Point W6**.

Basin RD-7 (0.47 ac, Q_5 = 1.8 cfs, Q_{100} = 3.5 cfs): a sub-basin defining a portion of the proposed private road along the north of Lot 7, and east sides of Lots 5 & 6. This basin consists of roadway, sidewalk, and landscape. Runoff from this basin sheet flows to the proposed curb & gutter, where it is then conveyed to a proposed, at-grade, COS Type 3 private curb inlet at **Design Point W10**.

Basin RD-8 (0.62 ac, Q_5 = 2.4 cfs, Q_{100} = 4.5 cfs): a sub-basin defining a portion of the proposed private road along the east sides of Lots 7 & 8. This basin consists of roadway, sidewalk, and landscape. Runoff from this basin sheet flows to the proposed curb & gutter, where it is then conveyed to a proposed, at-grade, COS Type 3 private curb inlet at **Design Point W13**.

Basin RD-9 (0.35 ac, Q_5 = 1.2 cfs, Q_{100} = 2.4 cfs): a sub-basin defining a portion of the proposed private road along the east sides of Lots 8 & 9. This basin consists of roadway, sidewalk, and landscape. Runoff from this basin sheet flows to the proposed curb & gutter, where it is then conveyed to a proposed, at-grade, COS Type 3 private curb inlet at **Design Point W15**.

Basin T-A (10.89 ac, Q_5 = 3.0 cfs, Q_{100} = 20.0 cfs): a sub-basin defining the eastern half of the site, consisting entirely of the existing portion of channel **RWT210** running through the site. This basin consists of natural vegetation and a combination of gravel and concrete maintenance access roads. Runoff from this basin is routed to the channel and conveyed to the existing public box culvert at **Design Point WT**.

Basin T-B (1.00 ac, Q_5 = 0.4 cfs, Q_{100} = 2.9 cfs): a sub-basin defining an area along the eastern property lines of Lots 1 & 2. This basin consists entirely of landscape and is undevelopable, as it is used as a slope tie-in to existing grade within the channel **RWT210** corridor. Runoff from this basin is routed to the channel and is included as part of **Design Point O1**.

Basin T-C (1.40 ac, Q_5 = 0.6 cfs, Q_{100} = 4.0 cfs): a sub-basin defining the area southeast of the proposed roundabout. This basin is utilized for existing utilities and the proposed, private, water quality pond. Runoff from this basin will be conveyed within the pond, via trickle channel, to the outlet structure at the southeast corner, annotated as **Design Point 1**. Flows will be released at a controlled rate and conveyed directly to channel **RWT210**, within **Basin T-A**. A weir and Emergency spillway will convey flows from a larger storm event to a proposed drainage swale within **Basin WF-4**.

Basin T-D (0.36 ac, Q_5 = 0.1 cfs, Q_{100} = 1.0 cfs): a sub-basin defining an area adjacent to the southwest corner of **Basin T-A**. This basin consists entirely of landscape and is undevelopable, as it is used as a slope tie-in to existing grade within the channel **RWT210** corridor and contains proposed and existing utilities. Runoff from this basin is routed to the channel and is included as part of **Design Point O1**.

Basin WA-1 (0.31 ac, Q_5 = 1.0 cfs, Q_{100} = 1.9 cfs): a sub-basin defining the western half of the proposed access to Woodmen Rd., adjacent to Lot 13. This basin consists of roadway, and landscape. Runoff from this basin sheet flows to the gutter. Gutter flows are then conveyed to a proposed, sump, Type 'R' public inlet at **Design Point A1**. In the case that the inlet becomes clogged, flows will overtop the roadway crown and drain to **Design Point A2**.

Basin WA-2 (0.40 ac, Q_5 = 1.6 cfs, Q_{100} = 3.0 cfs): a sub-basin defining the eastern half of the proposed access to Woodmen Rd., adjacent to Tract C. This basin consists of roadway, and landscape. Runoff from this basin sheet flows to the gutter. Gutter flows are then conveyed to a proposed, sump, Type 'R' public inlet at **Design Point A2**. In the case that the inlet becomes clogged, flows will overtop the roadway crown and drain to **Design Point A1**.

Basin WF-1 (0.47 ac, Q_5 = 1.6 cfs, Q_{100} = 3.0 cfs): a sub-basin defining a portion of the Woodmen Frontage Rd. south of Lot 2, Latigo Business Center Filing No. 1 (i.e. Falcon School District Facility). This basin was analyzed to compare flows to the existing CDOT Type 'C' public inlet, at **Design Point O2**, to those in the developed condition. This basin consists of existing & proposed roadway and vegetated roadside ditch. Runoff sheet flows to the vegetated roadside ditch, where it is then conveyed either east or west to the existing CDOT Type 'C' public inlet, at **Design Point O2.**

Basin WF-2 (0.86 ac, Q_5 = 2.7 cfs, Q_{100} = 5.5 cfs): a sub-basin defining the portion of Woodmen Frontage Rd. at the intersection of Bent Grass Meadows Dr., and the newly aligned segment of old Bent Grass Meadows Dr., adjacent to Lot 2, Latigo Business Center Filing No. 1 (i.e. Falcon School District Facility). This basin consists of proposed roadway, sidewalk, and landscape. Runoff from this basin sheet flows to the proposed gutter. Gutter flows are then conveyed east, to a proposed crosspan and rip-rap rundown at **Design Point F2.** Flows from this design point are conveyed to a proposed drainage swale in **Basin WF-3**.

Basin WF-3 (0.87 ac, Q_5 = 1.2 cfs, Q_{100} = 3.3 cfs): a sub-basin defining a portion of Woodmen Frontage Rd. being removed, south of Lots 13 & 14. This basin consists of proposed roadway and landscape. Runoff from this basin flows a proposed drainage swale, following the alignment of the old frontage road. Runoff from Woodmen Rd. that used to sheet flow to this area is now conveyed via gutter to a curb cut & rip-rap rundown at the southwest corner of the proposed access road intersection with Woodmen Rd. Flows from the proposed drainage swale are conveyed to a proposed, public, pipe culvert at **Design Point F3**.

Basin WF-4 (0.62 ac, Q_5 = 0.2 cfs, Q_{100} = 1.5 cfs): a sub-basin defining a portion of Woodmen Frontage Rd. being removed, south of Tract C. This basin consists of landscape. Runoff from this basin flows a proposed drainage swale, following the alignment of the old frontage road. Flows from the proposed drainage swale are conveyed to a proposed, public, pipe culvert at **Design Point F4** that convey flows under the newly aligned Bent Grass Meadows Dr., east of the proposed roundabout, to the existing channel **RWT210** within **Basin T-A**.

Basin WF-5 (0.30 ac, Q_5 = 1.2 cfs, Q_{100} = 2.2 cfs): a sub-basin defining the proposed deceleration lane, and portion of the east half of the new access road from Woodmen Rd. to the site. Runoff from this basin flows to the proposed gutter. Gutter flows are then conveyed, off-site, at **Design Point O3**. following existing drainage patterns to the east.

Runoff Comparison:

The proposed and existing condition flows at similar design points downstream are compared in the summary table below to show the change in flow.

Flows Leaving Site Comparison							
Existing				Proposed			
Design Point	Area (acres)	Q_5 (cfs)	Q_{100} (cfs)	Design Point	Area (acres)	Q_5 (cfs)	Q_{100} (cfs)
O2	0.41	1.8	3.3	O2	0.47	1.6	3.0
O3	1.03	2.1	4.3	O3	0.54	2.0	4.0
WT (Rational Method)	58.55	353.8	1,436.7	WT (Rational Method)	58.96	338.1	1,441.5
Total:	59.97			Total:	59.97		
WT (JWT210) (HEC-HMS)	1,916	195.7	1,093.7	WT (JWT210) (HEC-HMS)	1,916	228.6	1,102.7

As seen by the table above, flows leaving the site are not greater than the existing condition for **Design Points O2 & O3**. However, there is an increase in drainage area and flows to **Design Point WT** in the proposed condition. This was anticipated in the DBPS as 100-year detention is provided downstream, which includes this site.

The Channel **RWT210** was sufficiently sized to convey the developed flows as shown by the HEC-HMS results provided. Although this does show an increase in flow in the proposed condition, the ultimate future design at **RWT210** per the DBPS for the 5-year and 100-year event were calculated to be **250 CFS** and **1,300 CFS**, respectively. Based on the results obtained, the revised CN value for Basin **WT210-S** do not result in an increase above the DBPS design values at design point **RWT210**.

PROPOSED STORM INFRASTRUCTURE

Ownership & Maintenance:

Storm sewer within Bent Grass Meadows Dr., the swale and culvert along the old Woodmen Frontage Rd., and channel **RWT210** within Tract A are public and will be owned and maintained by the County. The remaining storm sewer system and proposed water quality pond will be privately owned and maintained by the developer.

Street Inlets:

The public & private storm inlets proposed with the site have been designed according to the criteria described earlier in the report. Calculations associated with the proposed inlets can be found in **Appendix C**.

VI. 4-Step Process

STEP 1 – VOLUME REDUCTION

The purpose of this step is to employ runoff reduction practices, also referred to as Low Impact Development (LID). This can be achieved by routing impervious flows across pervious areas, prior to entering the storm sewer system. Due to this site improvements being limited to utility infrastructure and roadways, the opportunity to provide LID on-site is limited.

What LID can be provided is done by conveying impervious sidewalk areas across landscape strips before flowing to the adjacent roadway curb & gutter. Additionally, a new roadside ditch is proposed parallel to Woodmen Rd. **Basins WF-2** & **WF-3** proposed roadway improvements are routed to this roadside ditch, prior to entering channel **RWT210**. This roadside ditch will provide LID in this instance.

More LID features can be provided by future pad site development and would be proposed by the subsequent drainage reports required for each future pad site. Draining impervious area across landscape areas, conveying runoff through vegetated drainage swales and rain gardens are all potential LID features that could be proposed by these future reports. To allow for flexibility of development within the future pad sites, these features were not proposed those areas. Features such as porous paving were not proposed due to their high maintenance obligation as well as the expectation of heavy truck traffic within the development.

STEP 2 – WQCV & DETENTION

TREATED AREAS & EXCLUSIONS:

In accordance with the DCM, Volume 2, Chapter 4 and the ECM, Appendix I.7.3, the site is required to provide stormwater quality for disturbed areas associated with this development. A private water quality pond is proposed with the development to address the requirements of the County. However, some disturbed areas not able to be captured and conveyed to the proposed water quality pond due to site constraints.

The County ECM identifies certain exclusions from the stormwater quality requirement that can be applied to disturbed areas from the development. A table is provided below to summarize these areas and references which exclusion from the ECM are applicable. Additionally, the County PCM Applicability Form is provided in **Appendix D** and an associated map provided in **Appendix F**.

WATER QUALITY TREATMENT SUMMARY TABLE						
Basin ID	**Total Area (ac)**	**Total Disturbed Area (ac)**	**Area Trib To WQ Pond (ac)**	**Disturbed Area Excluded from WQ per ECM App I.7.1.B.2 (ac)**	**Disturbed Area Excluded from WQ per ECM App I.7.1.B.7 (ac)**	**Disturbed Area Excluded from WQ per ECM App I.7.1.C.1.a (ac)**
BG	5.43	2.87	2.33		0.13	0.41
L	33.68	34.09	32.19		1.49	
RD	3.37	3.37	3.37			
T	13.65	2.76	1.40		1.36	
WA	0.71	0.71	0.71			
WF	3.12	2.96		1.73	1.23	
Total:	**59.97**	**46.36**	**40.01**	**1.73**	**4.21**	**0.41**

WATER QUALITY POND:
Stormwater Quality Treatment for the site is provided via a private Water Quality Pond located at the southeast portion of the site, adjacent to the southeast of the proposed roundabout. The proposed PCM tributary area is 40.69 acres at 89.4% imperviousness. The tributary area calculations are included in **Appendix D** for reference. A summary is provided below of the facility design volumes and drain times.

Description	Estimated Volume (ac-ft)	Provided Volume (ac-ft)	Max Ponding Depth (ft)	Time to Drain 97% (hours)	Time to Drain 99% (hours)
WQCV	1.322	1.322	4.12	38	41
EURV	N/A	N/A	N/A	N/A	N/A
5-Year Event	3.572	1.680	4.68	38	43
100-Year Event	8.126	1.904	5.00	32	40

Per Colorado state statue §37-92-602 (8), the following drain time criteria applies to all stormwater detention and infiltration facilities.

- Continuously release or infiltrate at least 97% of all runoff from a rainfall event that is less than or equal to a 5-year storm within 72 hours after the end of the event.
- Continuously release or infiltrate as quickly as practicable, but in all cases release or infiltrates at least 99% of the runoff within 120 hours after the end of events greater than a 5-year storm.

The proposed water quality pond ultimately outfalls into the adjacent **RWT210** channel via private storm pipe from the outlet structure. Flows that exceed the capacity of the outlet structure pipe will discharge into the adjacent roadside ditch to the south via a control weir constructed in-line with the emergency spillway. These flows are then conveyed to Channel **RWT210** by a proposed culvert under Woodmen Frontage Rd.

REGIONAL DETENTION DOWNSTREAM:
Based on the DBPS, **Regional Pond WU**, provides EURV & 100-Year detention for this stie. This regional facility is located at the northwest corner of Meridian Rd. & State Highway 24. Per the DBPS Amendment and Falcon Meadows at Bent Grass Subdivision, **Pond WU's** outlet structure was improved to ensure it provided EURV and Detention for the future build out condition of the sub-basins upstream. Results from the revised HEC-HMS model can be found in **Appendix B** and existing pond design calculations excerpts from the DBPS Amendment are included in **Appendix A**. A summary table demonstrating sufficient volume for this site are provided in the table below:

Description	Estimated Volume (ac-ft)	Max Ponding Elevation (ft)	Provided Volume (ac-ft)	Spillway Crest Elevation (ft)
5-Year Event	11.2	6822.30	38.9	6828.00
100-Year Event	31.0	6826.50	38.9	6828.00

STEP 3 – CHANNEL STABILIZATION

This step implements stabilization to channels to accommodate developed flows while protecting infrastructure and controlling sediment loading from erosion in the drainageways. All new and re-development projects are required to construct or participate in the funding of channel stabilization within the drainage basin. As discussed throughout the report, the proposed development contains a portion of the receiving major drainageway **RWT210**. Channel improvements were recently completed with Falcon Meadows at Bent Grass Subdivision to the north, extending through the site, to the existing culvert at Woodmen Road. No additional improvements are required to the drainageway.

STEP 4 – SOURCE CONTROL

The biggest source control CM's is public education which can be found on the El Paso County website and Mile High Flood District USDCM, Volume 3. Discussion topics include: pet waste, car washing, private maintenance landscaping, fall leaves, and snow melt and deicer. Dumping of waste materials in the proposed storm sewer system is not permitted. There are no plans for outdoor stockpiling of materials onsite after construction has been completed, therefore, no other source CM's are anticipated at this time.

VII. DRAINAGE & BRIDGE FEES

The site is not currently platted and is therefore required to participate in the drainage basin fee program. The table below reflects the **Falcon Drainage Basin** fees for 2026. Drainage basin fees are paid at the time of plat recordation. Per the County ECM, Appendix L, the proposed development is designated as commercial and therefore impervious area for the developable platted area (excluding Tract A for the existing channel) is based on 95% Imperviousness.

2026 Drainage Basin Fee

Drainage Basin	Drainage Fee (per impervious acre)	Bridge Fee (per impervious acre)	Total Platted Area (Excl. Tract A)	Impervious Area (acres)	Total Drainage Fees
Falcon	$44,042	$6,050	42.979	40.830	$2,045,256.36

A copy of the El Paso Conty 2026 Drainage Basin Fees schedule has been included in **Appendix A** for reference.

VIII. VARIANCES

No variances are proposed with this report.

IX. CONCLUSION

This preliminary drainage report for The Markets At Bent Grass was prepared using the methods and procedures described, and is in conformance with, the El Paso County Drainage Criteria Manual (DCM), Volumes 1 & 2 and Engineering Criteria Manual (ECM), Appendix I. Additionally, it was prepared in accordance with the applicable chapters of the Mile High Flood District (MHFD) Urban Stormwater Drainage Criteria Manual (USDCM), Volumes 1-3 and The City of Colorado Springs Drainage Criteria Manual (CS-DCM), Volumes 1-2.

This report demonstrates that the proposed Site is in general conformance with the Falcon Basin DBPS. Additionally, it demonstrates that the site runoff and appurtenances will not adversely affect downstream or surrounding developments.

N

The pin displayed on the map is an approximate point selected by the user and does not represent an authoritative property location.

This map complies with FEMA's standards for the use of digital flood maps if it is not void as described below. The basemap shown complies with FEMA's basemap accuracy standards

The flood hazard information is derived directly from the authoritative NFHL web services provided by FEMA. This map was exported on 2/2/2026 at 6:54 PM and does not reflect changes or amendments subsequent to this date and time. The NFHL and effective information may change or become superseded by new data over time.

This map image is void if the one or more of the following map elements do not appear: basemap imagery, flood zone labels, legend, scale bar, map creation date, community identifiers, FIRM panel number, and FIRM effective date. Map images for unmapped and unmodernized areas cannot be used for regulatory purposes.

United States Department of Agriculture

NRCS

Natural Resources Conservation Service

A product of the National Cooperative Soil Survey, a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local participants

Custom Soil Resource Report for El Paso County Area, Colorado

November 4, 2025

Preface

Soil surveys contain information that affects land use planning in survey areas. They highlight soil limitations that affect various land uses and provide information about the properties of the soils in the survey areas. Soil surveys are designed for many different users, including farmers, ranchers, foresters, agronomists, urban planners, community officials, engineers, developers, builders, and home buyers. Also, conservationists, teachers, students, and specialists in recreation, waste disposal, and pollution control can use the surveys to help them understand, protect, or enhance the environment.

Various land use regulations of Federal, State, and local governments may impose special restrictions on land use or land treatment. Soil surveys identify soil properties that are used in making various land use or land treatment decisions. The information is intended to help the land users identify and reduce the effects of soil limitations on various land uses. The landowner or user is responsible for identifying and complying with existing laws and regulations.

Although soil survey information can be used for general farm, local, and wider area planning, onsite investigation is needed to supplement this information in some cases. Examples include soil quality assessments (http://www.nrcs.usda.gov/wps/portal/nrcs/main/soils/health/) and certain conservation and engineering applications. For more detailed information, contact your local USDA Service Center (https://offices.sc.egov.usda.gov/locator/app?agency=nrcs) or your NRCS State Soil Scientist (http://www.nrcs.usda.gov/wps/portal/nrcs/detail/soils/contactus/?cid=nrcs142p2_053951).

Great differences in soil properties can occur within short distances. Some soils are seasonally wet or subject to flooding. Some are too unstable to be used as a foundation for buildings or roads. Clayey or wet soils are poorly suited to use as septic tank absorption fields. A high water table makes a soil poorly suited to basements or underground installations.

The National Cooperative Soil Survey is a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local agencies. The Natural Resources Conservation Service (NRCS) has leadership for the Federal part of the National Cooperative Soil Survey.

Information about soils is updated periodically. Updated information is available through the NRCS Web Soil Survey, the site for official soil survey information.

The U.S. Department of Agriculture (USDA) prohibits discrimination in all its programs and activities on the basis of race, color, national origin, age, disability, and where applicable, sex, marital status, familial status, parental status, religion, sexual orientation, genetic information, political beliefs, reprisal, or because all or a part of an individual's income is derived from any public assistance program. (Not all prohibited bases apply to all programs.) Persons with disabilities who require

alternative means for communication of program information (Braille, large print, audiotape, etc.) should contact USDA's TARGET Center at (202) 720-2600 (voice and TDD). To file a complaint of discrimination, write to USDA, Director, Office of Civil Rights, 1400 Independence Avenue, S.W., Washington, D.C. 20250-9410 or call (800) 795-3272 (voice) or (202) 720-6382 (TDD). USDA is an equal opportunity provider and employer.

Contents

Soil Map

The soil map section includes the soil map for the defined area of interest, a list of soil map units on the map and extent of each map unit, and cartographic symbols displayed on the map. Also presented are various metadata about data used to produce the map, and a description of each soil map unit.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL:
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: El Paso County Area, Colorado
Survey Area Data: Version 23, Aug 29, 2025

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Jul 23, 2024—Aug 4, 2024

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Map Unit Legend

Map Unit Symbol	Map Unit Name	Acres in AOI	Percent of AOI
9	Blakeland-Fluvaquentic Haplaquolls	0.1	0.2%
19	Columbine gravelly sandy loam, 0 to 3 percent slopes	40.3	99.8%
Totals for Area of Interest		**40.3**	**100.0%**

Map Unit Descriptions

The map units delineated on the detailed soil maps in a soil survey represent the soils or miscellaneous areas in the survey area. The map unit descriptions, along with the maps, can be used to determine the composition and properties of a unit.

A map unit delineation on a soil map represents an area dominated by one or more major kinds of soil or miscellaneous areas. A map unit is identified and named according to the taxonomic classification of the dominant soils. Within a taxonomic class there are precisely defined limits for the properties of the soils. On the landscape, however, the soils are natural phenomena, and they have the characteristic variability of all natural phenomena. Thus, the range of some observed properties may extend beyond the limits defined for a taxonomic class. Areas of soils of a single taxonomic class rarely, if ever, can be mapped without including areas of other taxonomic classes. Consequently, every map unit is made up of the soils or miscellaneous areas for which it is named and some minor components that belong to taxonomic classes other than those of the major soils.

Most minor soils have properties similar to those of the dominant soil or soils in the map unit, and thus they do not affect use and management. These are called noncontrasting, or similar, components. They may or may not be mentioned in a particular map unit description. Other minor components, however, have properties and behavioral characteristics divergent enough to affect use or to require different management. These are called contrasting, or dissimilar, components. They generally are in small areas and could not be mapped separately because of the scale used. Some small areas of strongly contrasting soils or miscellaneous areas are identified by a special symbol on the maps. If included in the database for a given area, the contrasting minor components are identified in the map unit descriptions along with some characteristics of each. A few areas of minor components may not have been observed, and consequently they are not mentioned in the descriptions, especially where the pattern was so complex that it was impractical to make enough observations to identify all the soils and miscellaneous areas on the landscape.

The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The objective of mapping is not to delineate pure taxonomic classes but rather to separate the landscape into landforms or landform segments that have similar use and management requirements. The delineation of such segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, however,

onsite investigation is needed to define and locate the soils and miscellaneous areas.

An identifying symbol precedes the map unit name in the map unit descriptions. Each description includes general facts about the unit and gives important soil properties and qualities.

Soils that have profiles that are almost alike make up a *soil series*. Except for differences in texture of the surface layer, all the soils of a series have major horizons that are similar in composition, thickness, and arrangement.

Soils of one series can differ in texture of the surface layer, slope, stoniness, salinity, degree of erosion, and other characteristics that affect their use. On the basis of such differences, a soil series is divided into *soil phases*. Most of the areas shown on the detailed soil maps are phases of soil series. The name of a soil phase commonly indicates a feature that affects use or management. For example, Alpha silt loam, 0 to 2 percent slopes, is a phase of the Alpha series.

Some map units are made up of two or more major soils or miscellaneous areas. These map units are complexes, associations, or undifferentiated groups.

A *complex* consists of two or more soils or miscellaneous areas in such an intricate pattern or in such small areas that they cannot be shown separately on the maps. The pattern and proportion of the soils or miscellaneous areas are somewhat similar in all areas. Alpha-Beta complex, 0 to 6 percent slopes, is an example.

An *association* is made up of two or more geographically associated soils or miscellaneous areas that are shown as one unit on the maps. Because of present or anticipated uses of the map units in the survey area, it was not considered practical or necessary to map the soils or miscellaneous areas separately. The pattern and relative proportion of the soils or miscellaneous areas are somewhat similar. Alpha-Beta association, 0 to 2 percent slopes, is an example.

An *undifferentiated group* is made up of two or more soils or miscellaneous areas that could be mapped individually but are mapped as one unit because similar interpretations can be made for use and management. The pattern and proportion of the soils or miscellaneous areas in a mapped area are not uniform. An area can be made up of only one of the major soils or miscellaneous areas, or it can be made up of all of them. Alpha and Beta soils, 0 to 2 percent slopes, is an example.

Some surveys include *miscellaneous areas*. Such areas have little or no soil material and support little or no vegetation. Rock outcrop is an example.

El Paso County Area, Colorado

9—Blakeland-Fluvaquentic Haplaquolls

Map Unit Setting

National map unit symbol: 36b6
Elevation: 3,500 to 5,800 feet
Mean annual precipitation: 13 to 17 inches
Mean annual air temperature: 46 to 55 degrees F
Frost-free period: 110 to 165 days
Farmland classification: Not prime farmland

Map Unit Composition

Blakeland and similar soils: 60 percent
Fluvaquentic haplaquolls and similar soils: 38 percent
Minor components: 2 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Blakeland

Setting

Landform: Flats, hills
Landform position (three-dimensional): Side slope, talf
Down-slope shape: Linear
Across-slope shape: Linear
Parent material: Sandy alluvium derived from arkose and/or eolian deposits derived from arkose

Typical profile

A - 0 to 11 inches: loamy sand
AC - 11 to 27 inches: loamy sand
C - 27 to 60 inches: sand

Properties and qualities

Slope: 1 to 9 percent
Depth to restrictive feature: More than 80 inches
Drainage class: Somewhat excessively drained
Runoff class: Low
Capacity of the most limiting layer to transmit water (Ksat): High to very high (5.95 to 19.98 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Calcium carbonate, maximum content: 5 percent
Available water supply, 0 to 60 inches: Low (about 4.5 inches)

Interpretive groups

Land capability classification (irrigated): 3e
Land capability classification (nonirrigated): 6e
Hydrologic Soil Group: A
Ecological site: R049XB210CO - Sandy Foothill
Hydric soil rating: No

Description of Fluvaquentic Haplaquolls

Setting

Landform: Swales
Down-slope shape: Linear
Across-slope shape: Linear
Parent material: Alluvium

Typical profile

H1 - 0 to 12 inches: variable
H2 - 12 to 60 inches: stratified very gravelly sand to loam

Properties and qualities

Slope: 1 to 2 percent
Depth to restrictive feature: More than 80 inches
Drainage class: Poorly drained
Runoff class: Very high
Capacity of the most limiting layer to transmit water (Ksat): Moderately high to high (0.20 to 6.00 in/hr)
Depth to water table: About 0 to 24 inches
Frequency of flooding: Occasional
Frequency of ponding: None
Maximum salinity: Nonsaline to slightly saline (0.0 to 4.0 mmhos/cm)
Available water supply, 0 to 60 inches: Moderate (about 6.2 inches)

Interpretive groups

Land capability classification (irrigated): 6w
Land capability classification (nonirrigated): 6w
Hydrologic Soil Group: D
Ecological site: R048AY241CO - Mountain Meadow
Hydric soil rating: Yes

Minor Components

Other soils

Percent of map unit: 1 percent
Hydric soil rating: No

Pleasant

Percent of map unit: 1 percent
Landform: Depressions
Hydric soil rating: Yes

19—Columbine gravelly sandy loam, 0 to 3 percent slopes

Map Unit Setting

National map unit symbol: 367p
Elevation: 6,500 to 7,300 feet
Mean annual precipitation: 14 to 16 inches
Mean annual air temperature: 46 to 50 degrees F

Frost-free period: 125 to 145 days
Farmland classification: Not prime farmland

Map Unit Composition

Columbine and similar soils: 97 percent
Minor components: 3 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Columbine

Setting

Landform: Fans, fan terraces, flood plains
Down-slope shape: Linear
Across-slope shape: Linear
Parent material: Alluvium

Typical profile

A - 0 to 14 inches: gravelly sandy loam
C - 14 to 60 inches: very gravelly loamy sand

Properties and qualities

Slope: 0 to 3 percent
Depth to restrictive feature: More than 80 inches
Drainage class: Well drained
Runoff class: Very low
Capacity of the most limiting layer to transmit water (Ksat): High to very high (5.95 to 19.98 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Available water supply, 0 to 60 inches: Very low (about 2.5 inches)

Interpretive groups

Land capability classification (irrigated): 4e
Land capability classification (nonirrigated): 6e
Hydrologic Soil Group: A
Ecological site: R049XY214CO - Gravelly Foothill
Hydric soil rating: No

Minor Components

Fluvaquentic haplaquolls

Percent of map unit: 1 percent
Landform: Swales
Hydric soil rating: Yes

Other soils

Percent of map unit: 1 percent
Hydric soil rating: No

Pleasant

Percent of map unit: 1 percent
Landform: Depressions
Hydric soil rating: Yes

[1] Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS).

Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values.

3.2 Time of Concentration

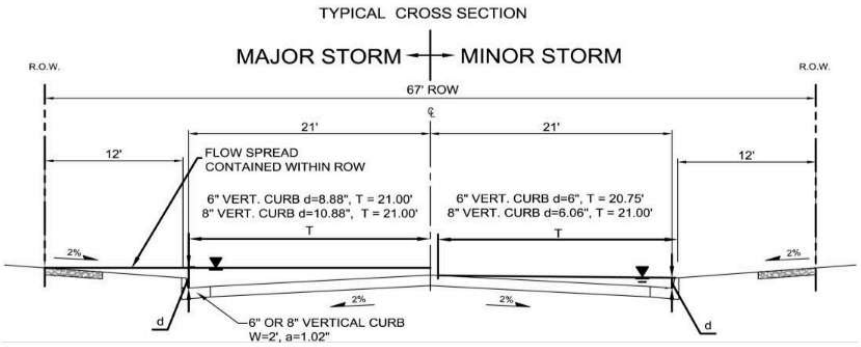
One of the basic assumptions underlying the Rational Method is that runoff is a function of the average rainfall rate during the time required for water to flow from the hydraulically most remote part of the drainage area under consideration to the design point. However, in practice, the time of concentration can be an empirical value that results in reasonable and acceptable peak flow calculations.

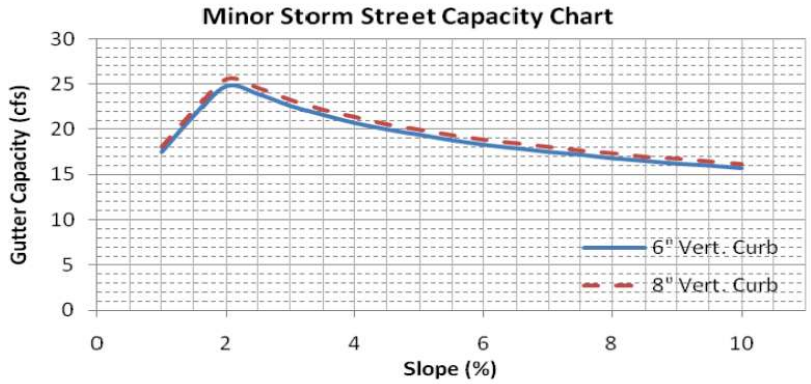
For urban areas, the time of concentration (t_c) consists of an initial time or overland flow time (t_i) plus the travel time (t_t) in the storm sewer, paved gutter, roadside drainage ditch, or drainage channel. For non-urban areas, the time of concentration consists of an overland flow time (t_i) plus the time of travel in a concentrated form, such as a swale or drainageway. The travel portion (t_t) of the time of concentration can be estimated from the hydraulic properties of the storm sewer, gutter, swale, ditch, or drainageway. Initial time, on the other hand, will vary with surface slope, depression storage, surface cover, antecedent rainfall, and infiltration capacity of the soil, as well as distance of surface flow. The time of concentration is represented by Equation 6-7 for both urban and non-urban areas.

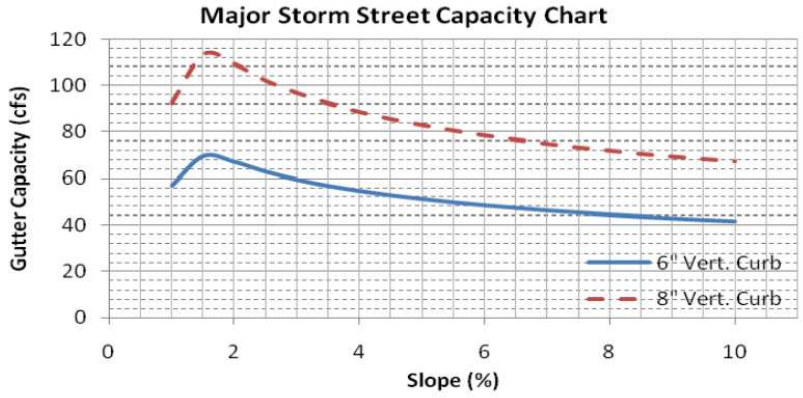
Runoff curve numbers for urban areas

Cover description: Cover type and hydrologic condition	Average percent impervious area	Curve numbers for hydrologic soil group: A	B	C	D
Fully developed urban areas (vegetation established)					
Open space (lawns, parks, golf courses, cemeteries, etc.) [3]:					
Poor condition (grass cover < 50%)		68	79	86	89
Fair condition (grass cover 50% to 75%)		49	69	79	84
Good condition (grass cover > 75%)		39	61	74	80
Impervious areas:					
Paved parking lots, roofs, driveways, etc. (excluding right-of-way)		98	98	98	98
Streets and roads:					
Paved; curbs and storm sewers (excluding right-of-way)		98	98	98	98
Paved; open ditches (including right-of-way)		83	89	92	93
Gravel (including right-of-way)		76	85	89	91
Dirt (including right-of-way)		72	82	87	89
Western desert urban areas:					
Natural desert landscaping (pervious areas only) [4]		63	77	85	88
Artificial desert landscaping (impervious weed barrier, desert shrub with 1- to 2-inch sand or gravel mulch and basin borders)		96	96	96	96
Urban districts:					
Commercial and business	85	89	92	94	95
Industrial	72	81	88	91	93
Residential districts by average lot size:					
1/8 acre or less (town houses)	65	77	85	90	92
1/4 acre	38	61	75	83	87
1/3 acre	30	57	72	81	86
1/2 acre	25	54	70	80	85
1 acre	20	51	68	79	84
2 acres	12	46	65	77	82
Developing urban areas					
Newly graded areas (pervious areas only, no vegetation) [5]		77	86	91	94

Figure 7-5. Street Capacity Charts Collector (with Parking)







These charts shall only be used for the standard street sections as shown. The capacity shown is based on ½ the street section as calculated by the UD-Inlet spreadsheets. Minor storm capacities are based on no crown overtopping, curb height or maximum allowable spread widths. Major storm capacities are based on flow being containing within the public right-of-way, including conveyance capacity behind the curb. The UDFCD Safety Reduction Factor was applied. An 'n_{STREET}' of 0.016 and 'n_{BACK}' of 0.020 was used. Calculations were done using UD-Inlet 3.00.xls, March, 2011.

El Paso County Drainage Basin Fees

Resolution No. 25-302_____

Basin Number	Receiving Waters	Year Studied	Drainage Basin Name	2026 Drainage Fee (per Impervious Acre)	2026 Bridge Fee (per Impervious Acre)
Drainage Basins with DBPS's:					
CHMS0200	Chico Creek	2013	Haegler Ranch	$15,350	$2,265
CHWS1200	Chico Creek	2001	Bennett Ranch	$17,184	$6,592
CHWS1400	Chico Creek	2013	Falcon	$44,042	$6,050
FOFO2000	Fountain Creek	2025	Jimmy Camp Creek[3]	$58,638	$0
FOFO2600	Fountain Creek	1991*	Big Johnson / Crews Gulch	$27,282	$3,523
FOFO2800	Fountain Creek	1988*	Widefield	$27,282	$0

FOFO3000	Fountain Creek	1991*	Windmill Gulch	$27,282	$409
FOFO3100 / FOFO3200	Fountain Creek	1988*	Carson Street / Little Johnson	$16,641	$0
FOFO3400	Fountain Creek	1984*	Peterson Field	$19,678	$1,492
FOFO3600	Fountain Creek	1991*	Fisher's Canyon	$27,282	$0
FOFO4000	Fountain Creek	1996	Sand Creek	$28,160	$11,518
FOFO4200	Fountain Creek	1977	Spring Creek	$14,149	$0
FOFO4600	Fountain Creek	1984*	Southwest Area	$27,282	$0
FOFO4800	Fountain Creek	1991	Bear Creek	$27,282	$1,492
FOFO5800	Fountain Creek	1964	Camp Creek	$3,023	$0
FOMO1000	Monument Creek	1981	Douglas Creek	$17,157	$379
FOMO1200	Monument Creek	1977	Templeton Gap	$17,614	$409
FOMO2000	Monument Creek	1971	Pulpit Rock	$9,047	$0
FOMO2200	Monument Creek	1994	Cottonwood Creek / S. Pine	$27,282	$1,492
FOMO2400	Monument Creek	1966	Dry Creek	$21,537	$780
FOMO3600	Monument Creek	1989*	Black Squirrel Creek	$12,387	$780
FOMO3700	Monument Creek	1987*	Middle Tributary	$22,766	$0
FOMO3800	Monument Creek	1987*	Monument Branch	$27,282	$0
FOMO4000	Monument Creek	1996	Smith Creek	$11,122	$1,492
FOMO4200	Monument Creek	1989*	Black Forest	$27,282	$743
FOMO5200	Monument Creek	1993*	Dirty Woman Creek	$27,282	$1,492
FOMO5300	Fountain Creek	1993*	Crystal Creek	$27,282	$1,492
Miscellaneous Drainage Basins: [1]					
CHBS0800	Chico Creek		Book Ranch	$25,599	$3,706
CHEC0400	Chico Creek		Upper East Chico	$13,946	$404
CHWS0200	Chico Creek		Telephone Exchange	$15,323	$359
CHWS0400	Chico Creek		Livestock Company	$25,240	$300
CHWS0600	Chico Creek		West Squirrel	$13,156	$5,460
CHWS0800	Chico Creek		Solberg Ranch	$27,282	$0
FOFO1200	Fountain Creek		Crooked Canyon	$8,237	$0
FOFO1400	Fountain Creek		Calhan Reservoir	$6,877	$401
FOFO1600	Fountain Creek		Sand Canyon	$4,968	$0
FOFO2200	Fountain Creek		Fort Carson	$21,537	$780
FOFO2700	Fountain Creek		West Little Johnson	$1,798	$0
FOFO3800	Fountain Creek		Stratton	$13,086	$585
FOFO5000	Fountain Creek		Midland	$21,537	$780
FOFO6000	Fountain Creek		Palmer Trail	$21,537	$780
FOFO6800	Fountain Creek		Black Canyon	$21,537	$780
FOMO4600	Monument Creek		Beaver Creek	$16,311	$0
FOMO3000	Monument Creek		Kettle Creek	$14,733	$0
FOMO3400	Monument Creek		Elkhorn	$2,475	$0
FOMO5000	Monument Creek		Monument Rock	$11,825	$0
FOMO5400	Monument Creek		Palmer Lake	$18,908	$0
FOMO5600	Monument Creek		Raspberry Mountain	$6,360	$0
PLPL0200	Monument Creek		Bald Mountain	$13,554	$0
Interim Drainage Basins: [2]					
FOFO1800	Fountain Creek		Little Fountain Creek	$3,488	$0
FOMO4400	Monument Creek		Jackson Creek	$10,799	$0
FOMO4800	Monument Creek		Teachout Creek	$7,499	$1,127

1. The miscellaneous drainage fee previous to September 1999 resolution was the average of all drainage fees for basins with Basin Planning Studies performed within the previous 14 years.

2. Interim Drainage Fees are based upon draft Drainage Basin Planning Studies or the Drainage Basin Identification and Fee Estimation Report. (Best available information suitable for setting a fee.)

3. Per Resolutions 25-95 and 25-96, the Bull-Hill/Rolling Meadows development and the West Fork Jimmy Camp Creek are closed for fees.

RESOLUTION NO. 15- 387

BOARD OF COUNTY COMMISSIONERS
COUNTY OF EL PASO, STATE OF COLORADO

RESOLUTION TO RECOGNIZE AND ADOPT THE FALCON DRAINAGE BASIN PLANNING STUDY AND TO ESTABLISH A DRAINAGE FEE AND BRIDGE FEE FOR THE BASIN (CHWS1400)

WHEREAS, the Board of County Commissioners of the County of El Paso ("Board") has the authority granted to it under the provisions of §§30-11-101, (1)(e), and 30-11-107, (1)(e), C.R.S., to represent the County and exercise its further powers to address concerns of the County in all cases where no other provisions are made by law; and

WHEREAS, a plan for the development of drainage basins of mutual concern was adopted by the El Paso County Planning Commission as part of the County Master Plan on December 17, 1984 and has been subsequently amended; and

WHEREAS, Section 30-28-133(11), C.R.S., authorizes counties to adopt subdivision regulations providing for the payment of a sum of money or proof of a line of credit or other fees in equitable contribution to the total costs of the drainage facilities in the drainage basin in which the subdivision is located; and

WHEREAS, Section 8.5.5 of the *El Paso County Land Development Code* provides for the assessment of drainage basin and bridge fees and for the repayment to a subdivider, from any surplus basin funds available, of any costs the subdivider incurs because of compliance with the plans for the development of drainage basins in excess of the sum of the drainage basin fees assessed against the subdivider's impervious acreage; and

WHEREAS, the Board of County Commissioners of El Paso County, Colorado, Resolution 87-178A, authorized creation of the *City of Colorado Springs/El Paso County Drainage Criteria Manual* to set forth provisions for drainage policies, criteria, finance, and administration; and

WHEREAS, said manual has been further modified by Resolutions Nos. 88-58, 91-334, 95-81, 01-384, 04-483, 15-42 and others; and

WHEREAS, the El Paso County Public Services Department initiated an update to the Falcon Drainage Basin Planning Study dated December 15, 2000 (approved by the Planning Commission on October 17, 2000 and the Board of County Commissioners on December 14, 2000); and

WHEREAS, in accordance with the procedures outlined in the aforementioned *City of Colorado Springs/El Paso County Drainage Criteria Manual*, the El Paso County Public

ORIGINAL DBPS EXCERPTS

Services Department has reviewed the Falcon Drainage Basin Planning Study dated September 2015 as prepared by Matrix Design Group; and

WHEREAS, the El Paso County Public Services Department has reviewed the aforementioned Drainage Basin Planning Study and associated Drainage Basin and Bridge Fees, and finds them to be in substantial conformance with the procedures of said *City of Colorado Springs/El Paso County Drainage Criteria Manual*; and

WHEREAS, the City/County Drainage Board has recommended approval of the Falcon Drainage Basin Planning Study at their October 3, 2013 meeting; and

WHEREAS, the El Paso County Planning Commission approved the Falcon Drainage Basin Planning Study as an amendment to and component of the El Paso County Master Plan on September 17, 2013 (MP-13; and

WHEREAS, the Housing & Building Association of Colorado Springs has offered their support of the Falcon Drainage Basin Planning Study and adoption of the associated fees and also request a commitment from the County that Staff continue coordination with regional stakeholders concerning the El Paso County Drainage Basin Fee Program and evaluate options for program improvements, specifically the following options: trading of credits among property owners within each basin and the formation of Title 37 Conservancy Districts; and

WHEREAS, since the development of the Falcon Drainage Basin Planning Study in 2013, the El Paso County Board of Commissioners have adjusted the drainage and bridge fees in the amount of 4.3% in accordance with Resolution 14-128 (Reception No. 214028996) based upon various economic indexes for the region and the drainage fees of $23,217 and bridge fees of $3,189 per impervious acre calculated in the study should also be adjusted accordingly resulting in the fee the be established as $24,215 per impervious acre and $3,326 per impervious acre respectively; and

WHEREAS, the Board having reviewed the Falcon Drainage Basin Planning Study has determined that it is in the best interest of the public to recommend adoption of this Study, which is attached hereto as Exhibit A, and incorporated herein by reference.

NOW THEREFORE BE IT RESOLVED by the Board of County Commissioners of El Paso County, Colorado finds that:

1. The Falcon Drainage Basin Planning Study and final fee recommendations prepared by Matrix Design Group dated September 2015 shall be formally adopted as the official Drainage Basin Planning Study for all properties lying within the boundaries of the Falcon Drainage Basin, Basin No. CHWS1400, as defined in said document.

2. Drainage Fees and Bridge Fees shall be established as $24,215 per impervious acre and $3,326 per impervious acre respectively.

3. This resolution shall become effective immediately and be applied to all development within the Falcon Drainage Basin boundaries in the County where the County has not accepted a final plat submittal as of the date of the adoption of this resolution.

BE IT FURTHER RESOLVED that the Board of County Commissioners of El Paso County, Colorado, hereby directs the County Engineer and appropriate staff, including but not limited to the Public Services Department and Development Services Department, to conduct a coordinated effort to evaluate options for improvements to the El Paso County Drainage Basin Fee Program including but not limited to those aforementioned options proposed by the Housing & Building Association of Colorado Springs and provide an update concerning any recommended program changes to the El Paso County Board of Commissioners by December 31, 2016 which will include receiving recommendations by the appropriate El Paso County advisory committees that report to the El Paso County Board of Commissioners; and

BE IT FURTHER RESOLVED that Amy Lathen, duly elected, qualified member and Chair of the Board of County Commissioners, or, Dennis Hisey, duly elected, qualified member and Vice Chair of the Board of County Commissioners, be and is hereby authorized on behalf of the Board to execute any and all documents necessary to carry out the intent of the Board as described herein.

DONE THIS 6th day of October, 2015, at Colorado Springs, Colorado.

ORIGINAL DBPS EXCERPTS

3.0 HYDROLOGIC ANALYSIS

3.1. Watershed Description

The Falcon Watershed is located in the north central portion of El Paso County (County) and flows southeasterly from the southern slope of the Black Forest. The Falcon Watershed contains three perennial streams and has a contributing drainage area of approximately 10.6 square miles (sq mi) at its confluence with Black Squirrel Creek. A routing schematic of the Falcon Watershed is provided in Figure 3-1.

The headwaters of the Falcon Watershed are dominated by ponderosa pine forest and grassland on undeveloped large acreage tracts and 2- to 5-acre (ac) rural residential lots. The middle portion of the Falcon Watershed between Londonderry Drive and Highway 24 has been developed into residential areas consisting primarily of single-family homes, commercial centers, and vacant land. The lower portion of the Falcon Watershed south of Highway 24 is dominated by grassland on undeveloped large acreage tracts and 2- to 5-acre (ac) rural residential lots. A basin map of the Falcon Watershed is provided in Figure 3-2.

3.2. Methodology

Hydrologic analysis for the Falcon Watershed was completed for historical, existing, and future land use conditions by applying a 24-hour storm event with 2-, 5-, 10-, 25-, 50-, and 100-year recurrence intervals. The following sections provide a summary of the hydrologic analyses. A detailed compilation of hydrology model data, calculations, and results are provided in Appendix A.

3.3. HEC-HMS Model

A hydrology model for the Falcon Watershed was developed using the US Army Corps of Engineers (USACE) Hydrologic Engineering Center – Hydrologic Modeling System Version 3.5 (HEC-HMS) to simulate the rainfall-runoff process and generate flood hydrographs for select storm events. Each component of the model is described in detail following this section. A geospatially referenced basin model was developed in ArcGIS® Version 9.2 using USACE's Geospatial Hydrologic Modeling Extension (HEC-GeoHMS). Using these tools, subbasin and stream reach physical characteristics including area, longest hydraulic flowpath, reach length, slope, and topological connectivity were extracted for calculation of hydrologic parameters. Hydrologic parameters were calculated as outlined below and populated to the basin and meteorological components of the HEC-HMS model. A summary of selected methodologies for each HEC-HMS model component is provided in Table 3-1.

The Specified Hyetograph method was chosen to model the Type IIa hypothetical storm event recommended in the City of Colorado Springs and El Paso County Drainage Criteria Manual (DCM) (1991) with rainfall depths published in *NOAA Atlas II Vol. 3 (Miller et al. 1973)*. These hyetographs were imported into the HEC-HMS precipitation gage manager and applied to each subbasin within the Falcon Watershed. Rainfall was modeled with a uniform spatial distribution across the entire Falcon Watershed.

Infiltration and runoff volumes were modeled using the SCS (since renamed NRCS) Runoff Curve Number (runoff CN) Loss Method. The composite runoff CN was calculated for each subbasin and imported into HEC-HMS. For modeling purposes, initial infiltration loss rates were automatically calculated as functions of composite runoff CNs by HEC-HMS.

Table 3-1. HEC-HMS Model Components

Model Component	Selected Methodology
Meteorological Model	Specified Hyetograph
Infiltration Loss	SCS Runoff Curve Number Method
Runoff Transformation	SCS Unit Hydrograph Method
Channel Routing	Muskingum-Cunge Method
Baseflow Method	None

Notes:
SCS = Soil Conservation Service (since renamed Natural Resources Conservation Service)

The transformation of runoff volume to a runoff hydrograph was modeled using the SCS Unit Hydrograph Method. Subbasin lag times were calculated from the time of concentration as computed using the method outlined in *Technical Release 55* (*TR-55*) (NRCS 1986).

The Muskingum-Cunge Method was selected to develop the channel routing component of the HEC-HMS model. Eight-point cross sections developed from 2-foot (ft) contour data were used to represent open channel reaches while circular and rectangular sections were used to represent storm sewer reaches, as applicable.

3.4. Subbasin Delineation

Matrix subcontracted Aerial Mapping Services to obtain and develop orthometric aerial imagery of the current conditions within the Falcon Watershed to assist with the DBPS. Basin delineation and stream network definition were completed in an ArcGIS® environment using 2-ft contours, information obtained from field reconnaissance, and the storm sewer GIS coverage obtained from the County.

The Falcon Watershed was divided into 65 subbasins with areas ranging from 0.03 sq mi (19 ac) up to 0.33 sq mi (211 ac) as shown on Figure 3-2. Subbasin slopes in the Falcon Watershed range from 2.9% to 8.7%. Subbasins were delineated at tributaries, major road crossings, changes in slope, changes in land use, and major drainage features. Information obtained from drainage plans was used to supplement the basin delineation within developed areas when all other pieces of information did not provide a clear direction of delineation. Table 3-2 lists all drainage plans received from the County that were reviewed and incorporated as necessary.

The Falcon Watershed was divided into 3 major subbasins: West Tributary (WT), Middle Tributary (MT), and East Tributary (ET) as shown on Figure 3-2. The West Tributary consists of 37 subbasins and 10 minor tributaries along the entire length of the watershed from the Black Forest to the confluence with Black Squirrel Creek. These subbasins primarily encompass rural land with pockets of residential development. The Middle Tributary consists of 11 subbasins and 2 minor tributaries and is primarily north of Highway 24. These subbasins encompass rural, residential, and commercial land. The East Tributary consists of 16 subbasins and 1 minor tributary and encompasses residential land north of Highway 24 and rural land south of Highway 24.

6.0 PLAN DEVELOPMENT DESIGN

SEE BENT GRASS FILING NO. 2 FDR FOR POND WU IMPROVEMENTS AND UPDATED CALCS

6.1. Introduction

The purpose of the plan development design effort was to refine the selected detention and reach alternatives for the Falcon Watershed and finalize proposed infrastructure improvements and associated implementation costs. The recommended detention and reach alternatives, outlined in Section 5.0, were vetted through one public meeting and several project team meetings. The Sub Regional Detention Alternative along with the corresponding reach alternatives were selected to carry forward into plan development. The detention pond and reach components from the selected alternative were analyzed using a more detailed set of criteria to ensure that the recommendation would be feasible for future implementation. The outcome of the selected plan development design is a conceptual set of infrastructure improvements and costs for use in the fee development phase of this DBPS. All backup calculations and data are provided in Appendix D.

6.2. Selected Detention Alternative

The Sub Regional Detention Alternative that was recommended in Section 5.3 was refined by:

- Performing rough grading at each potential location.
- Maximizing storage for ponds based on existing site conditions.
- Modifying the SSD curves to target EURV or WQCV, and 100-yr volume with no spillway overtopping as outlined in Section 5-3. The EURV target outflow was based on releasing the EURV over 72 hours. The WQCV drain time was 40 hours. 100-yr target outflows were historical 100-yr flow where possible given storage constraints; selected as either the existing 100-yr flow or the lowest attainable 100-yr peak flow based on pond limitations. Release rates were greater than historic in some cases due to storage limitations. Storage and discharge requirements were calculated based on the guidelines outlined in the UDFCD DCM, Vol. 2.
- Assessing the hydrologic benefit of each pond.
- Spillway overtopping based on stage and storage calculations at 2 ft above the spillway elevation.

Full spectrum detention was incorporated into all existing and proposed detention ponds where applicable for this alternative. However, in some cases other controls were used due to pond volume limitations. A detailed analysis and summary for all of the detention ponds in the selected alternative are provided in Appendix D.

6.2.1. Detention Pond Classification

The selected detention alternative consists of 23 ponds that fall within 2 different classifications: existing constructed ponds and proposed ponds. All ponds are shown graphically in Figure 6-1.

Existing Constructed Ponds

Existing constructed ponds include PBH C, PBH A, PBH B1, PBH B2, M 1, R WUS, WH H, M 2, R MN, WH 5, PB 4, WH 1N, WH 1S, WH 2, WH 3, and WH 4. These ponds are currently constructed and functioning within the Falcon Watershed. Each of these ponds was evaluated to determine if it could be retrofit to provide a benefit to the selected detention alternative. Table 6-1 shows the proposed modification to the outlet stages of each of the existing constructed ponds.

Table 6-1. Existing Pond Outlet Modifications

Pond	Proposed Outlet Stages
Paintbrush Hills Pond C	EURV + 100-yr
Paintbrush Hills Pond A	WQCV + 100-yr
Paintbrush Hills Pond B1	Existing Configuration
Paintbrush Hills Pond B2	EURV + 100-yr
The Meadows Pond #1	EURV + 100-yr
Regional Pond WU South	EURV + 100-yr
Woodmen Hills Pond H	Existing Configuration
The Meadows Pond #2	EURV + 100-yr
Regional Pond MN	WQCV + 100-yr
Woodmen Hills Pond #5	EURV + 100-yr
Paint Brush Hills Pond #4	Existing Configuration
Woodmen Hills Pond #1 North	100-yr Only
Woodmen Hills Pond #1 South	EURV Only
Woodmen Hills Pond #2	EURV + 100-yr
Woodmen Hills Pond #3	WQCV + 100-yr
Woodmen Hills Pond #4	EURV + 100-yr

Both Woodmen Hills Pond H and Paint Brush Hills Pond #4 are grossly undersized and both of the spillways currently overtop during the 100-yr storm. As a result, no retrofit solution was provided for these ponds. It is recommended that on-site detention be incorporated upstream of these ponds to reduce flooding at these locations. The drainage area that needs to be mitigated by an EURV or WQCV at these pond locations was accounted for in downstream detention ponds.

Proposed Ponds

Proposed ponds include ponds SR 1, SR 2, SR 3, SR 4, R 1, SR 6, and R 2. These ponds are not constructed or planned for and are recommended as a part of the selected detention alternative. Table 6-2 shows the hydraulic configurations for the proposed ponds.

Table 6-2. Proposed Pond Outlet Configurations

Pond	Outlet Stages
Sub Regional Pond SR1	WQCV + 100-yr
Sub Regional Pond SR2	EURV Only
Sub Regional Pond SR3	EURV Only
Sub Regional Pond SR4	WQCV + 100-yr
Regional Pond R1	EURV + 100-yr
Sub Regional Pond SR6	EURV + 100-yr
Regional Pond R2	EURV Only

6.2.2. Hydrologic Results

The hydrologic results for the selected detention alternative are shown in Table 6-3. These results reflect all 23 ponds shown in Figure 6-1.

Table 6-7. Existing Bridge and Culvert Crossing Evaluation

Notes:
[1]According to the Drainage Criteria Manual

6.3.3. Plans & Profiles

Sheets 6-2 through 6-50 provide more detailed plan and profile views of selected reach improvements for each planning reach. These conceptual plans show stream centerline, detention ponds and associated data, proposed grade control structures, drainageway crossings and proposed improvements, and the approximate 100-yr floodplain along with existing infrastructure such as roadways and storm sewers. Hydraulic grade lines shown on the profile, representing the WSE for 5- and 100-year storm events, were generated using HEC-RAS along the main stem of each major tributary.

Sheets 6-51 through 6-56 provide typical details and section views of proposed reach grade control structures, detention pond profiles, and proposed roadside ditch improvements.

6.3.4. Reach Quantities & Cost Estimate

The assumptions and methods used to calculate the quantities and costs for each alternative category listed in Table 6-6 and defined in Section 5.4 are provided in the following sections. Additional costs as a percentage of the subtotal construction cost include Engineering/Construction Administration (15%) and Contingency (20%). Detailed quantities and cost estimates are provided in Appendix D.

Roadside Ditch Sizing

The quantities for this reach alternative include the infrastructure necessary to provide sufficient capacity for roadside ditches only. The required roadside ditch sizes were assumed to have the same slope and roughness as the infrastructure that is being replaced. The quantities and costs for all infrastructure sizing reaches are provided in Table 6-8.

Table 6-8. Roadside Ditch Cost Estimate

Reach	Length (ft)	Q100 (cfs)	Total Cost ($)
RWT344	1,379	250	$ 167,006
RWT354	16	2,200	$ 23,544
RET140	4,052	85	$ 295,914
RET164	2,072	630	$ 132,703
		Subtotal	$ 619,166
		Engineering/Construction Admin. (15%)	$ 92,875
		Contingency (20%)	$ 123,833
		Total	**$ 835,874**

Natural Channel Design

The quantities for this reach alternative include the number of structures per reach. Natural channel design costs were developed with the following assumptions:

- The crest width for a natural channel drop structure is the channel width associated with the low flow (bankfull) event as defined in the DCM update Section 3.1.1.1.
- Natural channel structures were spaced at increments of 7 times the low flow channel width.
- Cost per structure based on $24,400 per structure plus $420 times the width of the low flow channel.

ENGINEER'S STATEMENT

The attached drainage plan and report were prepared under my direction and supervision and are correct to the best of my knowledge and belief. Said drainage report has been prepared according to the criteria established by the County for drainage reports and said report is in conformity with the applicable master plan of the drainage basin. I accept responsibility for any liability caused by any negligent acts, errors or omissions on my part in preparing this report.

Conditions:

Basin EX-4 (12.49 AC, Q_5 = 3.7 cfs, Q_{100} = 25.1 cfs): is located along the northern boundary, just south of the swale built with Bent Grass Meadows Drive and west of the existing channel. The basin is currently undeveloped. Runoff from the basin generally flows to the south onto Bent Grass Meadows Drive at **DP 6**. From there, it flows via curb & gutter to the east into an existing sump inlet, ultimately discharging into the existing WQCV pond located in Basin EX-3.

Basin EX-5 (5.15 AC, Q_5 = 1.6 cfs, Q_{100} = 10.6 cfs): is west of Basin EX-4 and north of Bent Grass Meadows Drive. The basin is currently undeveloped. Runoff from the basin generally flows to the south onto Bent Grass Meadows Drive at **DP 7**. From there, it flows via curb & gutter to the east into an existing sump inlet, ultimately discharging into the existing WQCV pond located in Basin EX-3.

Basin EX-6 (9.53 AC, Q_5 = 2.7 cfs, Q_{100} = 17.8 cfs): is along the west boundary of the site. The basin is currently undeveloped and receives off-site flows from Basins OS-2 & OS-3. Runoff from the basin generally flows to the south into the existing drainage ditch entering an existing inlet at **DP 22** and flowing under Bent Grass Meadows Drive and discharging into an existing drainage swale in Basin EX-8.

Basin EX-7 (9.16 AC, Q_5 = 2.8 cfs, Q_{100} = 18.9 cfs): is north & west of Bent Grass Meadows Drive, between Basins EX-5 & EX-6. The basin is currently undeveloped. Runoff from the basin generally flows to the southeast into Bent Grass Meadows Drive at **DP 21**. From there, it flows via curb & gutter to the south into an existing sump inlet, ultimately discharging into the existing sediment pond located in Basin EX-8.

Basin EX-8 (21.3 AC, Q_5 = 6.6 cfs, Q_{100} = 43.9 cfs): is a portion of the site south and east of Bent Grass Meadows Drive, north of the south property line and west of Bent Grass Filing No. 2. The basin is currently undeveloped and contains two drainage ditches, a sediment pond, and a portion of the creek associated with Basin WT200 from the Falcon DBPS. Runoff from the basin generally flows to the southeast into the existing channel.

Overall flows exiting the Bent Grass Site at **DP CC** are 278.3 cfs for the minor storm and 1224.7 cfs for the major storm. These flows were determined using the rational method through the Falcon Meadows site combined with DBPS flows entering the site from basin WT200 which include channel reaches RWT202 & RWT204. The entirety of the Falcon Meadows property is considered to be undeveloped in the Current Models (HMS and Rational). Flows exiting the site are a mix of DBPS and rational flows. The flow will continue south through an existing leg of the West Tributary channel of the Falcon Basin.

The HEC-HMS model was revised to include Falcon Meadows as a separate basin, as requested by El Paso County Staff. Refer to the Revised SCS Basin Hydrology Map in Appendix B, which accompanies the HMS model. To accomplish this, revisions were made to Basins WT200, WT210 & WT220 in the West Tributary and to Basins MT060 and MT070 in the Middle Tributary. Middle Tributary is discussed in the previous section. The portion of Basin WT-200, north of Falcon Meadows, has been divided into two basin, WT200-N and WT200-W. WT200-N accounts for the area west of channel reach RWT204. WT200-W accounts for the portion of WT200 east of RWT204. This basin also includes a portion of what had originally been in Basin MT-070, in the middle tributary. Due to development and grading changes in the area, this additional area has been rerouted into the West Tributary of the Falcon Basin. The revised HEC-HMS models account for this increased area.

A new basin, Basin BG was created in the HMS model to represent Falcon Meadows. This basin includes small portions of each of the original basins WT200, WT210 and WT220. The area of the new basin is 117.9 acres. Basins WT200, WT210 and WT220 were updated accordingly see below for additional information. The flow from basin BG is 89.9 cfs for the 5-year storm and 255.6 cfs for the 100-year storm.

This flow will combine with the upstream flows (basins north of Falcon Meadows) and exit Falcon Meadows at **DP CC**. The corresponding flows at **DP CC** from the revised HMS model in this report are 186.2 cfs for the 5-year storm and 1044.6 cfs for the 100-year storm. The DBPS model did not have a corresponding design point to this location.

Remaining portions of two basins (WT210 and WT220, as shown in the DBPS) were assigned new basin designations. Basin WT210 is located on the west side of the channel. Basin WT220 is located south of Falcon Meadows, on the east side of the channel. These basins were revised in the HEC-HMS model. A portion of each of these basins has been moved into the BG basin, which represents Falcon Meadows. WT210 was divided into 2 basins, WT210-N, which accounts for the portion of the original WT210 that is west of Falcon Meadows and WT210-S represents the portion of the original basin south of Falcon Meadows. Basin WT220-S, represents the portion of the original WT220 basin which was not included in the BG basin. Refer to the Revised SCS Basin Hydrology Map in Appendix B for reconfiguration of the basins.

Basin WT210-N contains 47.5 acres and will continue to flow to the southeast. Flows for the basin are 24.9 cfs and 77.5 cfs for the minor and major events. Basin WT210-S contains 74.9 acres and flows generated from this basin are 57.9 and 173.3 cfs for the minor and major storm events. Basin WT220-S is 75.7 acres. Flows generated by this basin area 61.6 cfs and 178.8 cfs for the minor and major storm events. WT210-Sand WT220-S combine in the existing channel, flowing south to design point **JWT210** which is located at Woodmen Road. Revised flows at this location, based on the HMS model, are 189.8 cfs for the 5-year storm and 1054.7 cfs for the 100-year storm. DBPS flows at this location were 50 cfs and 950 cfs under existing conditions. The HMS model increase in flow, as compared to the DBPS flows, is caused by increases in area for WT200-W (WT200-W was increased as required by El Paso County Staff)(also, see Revised Basin Hydrology exhibit in Appendix B).

VI. Four Step Process

The Four Step Process is used to minimize the adverse impacts of urbanization and is a vital component of developing a balanced, sustainable project. Below identifies the approach to the four-step process:

1. Employ Runoff Reduction Practices

The proposed development uses Low Impact Development (LID) practices to reduce runoff at the source. Generally, rather than creating point discharges that are directly connected to impervious areas, runoff is routed through pervious areas to promote infiltration. In general, single family developments are good at promoting LID practices. The project site has incorporated open and vegetated areas throughout the area to help disconnect pervious areas. Grass buffers and swales are used where practical, specifically around the property boundary. These items will help in reducing runoff volumes.

2. Stabilize Drainageways

This step implements stabilization to the channel to accommodate developed flows while protecting infrastructure and controlling sediment loading from erosion in the drainageways. Erosion protection in the form of riprap pads at all outfall points to the channel to prevent scouring of the channel from point discharges.

A stability analysis on the existing roadside ditch along Meridian Road was conducted with results shown in Appendix C. From the analysis, it was determined that the existing ditch is not in stable condition with existing DBPS flows. Improvements are anticipated to be made in the future, per

Basin D-8 (1.69 AC, Q5 = 1.3 cfs, Q100 = 4.5 cfs): a basin that is west of the existing channel & south of Bent Grass Meadows Drive. It encompasses the back half of single-family residential lots. Runoff will flow from each lot and discharge into a proposed drainage ditch. The drainage ditch (Swale C) will then convey flows, ultimately discharging into the proposed south WQCV pond at **DP 44**.

Basin B-2 (4.16 AC, Q5 = 1.4 cfs, Q100 = 9.1 cfs): a basin that is in the south area of the site and encompasses the existing channel RWT210. Flows will sheet flow into the existing channel where they will then be conveyed to **DP CC** exiting the site.

Basins E-1 thru E-5 are the same as discussed under the Existing Conditions Section, as these basins represent the already built Bent Grass Meadows Drive through the proposed site.

The Bent Grass West development accounts for 2 additional water quality facilities to be built. These items were preliminarily designed in the Falcon Meadows for Bent Grass PDR and will be final designed with the FDR's for Falcon Meadows at Bent Grass Meadows Filing No. 1 & No. 2.

Upon exiting the Falcon Meadows development at **DP CC**, the basin hydrology and routing remains unchanged from the Current Conditions Section. From the Future HEC-HMS model, which accounts for Basin BG being fully developed, there is a minor flow of 191.9 cfs and a major flow of 1075.3 cfs. These flows are larger than the previous HMS flows (minor 186.2 cfs and major 1,044.6 cfs). Increase in flows is due to the full development of the Bent Grass site.

At design point **JWT210**, located at Woodmen Road, HMS flows are 195.7 cfs for the 5-year storm and 1093.7 cfs for the 100-year storm. DBPS flows under future conditions at this location are 250 cfs and 1,300 cfs for the minor and major storm events. The HMS model flows are less than the future (developed) DBPS flows (250 cfs and 1,300 cfs) at this location but are greater than the existing (undeveloped) DBPS flows (50 cfs and 950 cfs).

A future conditions drainage map has been prepared for this area. The proposed map is included in Appendix D.

VIII. Proposed Channel Improvements

MIDDLE TRIBUTARY

Although the existing channel and culverts are undersized and improvements will need to be made in the future, minimal channel improvements are being proposed at this time, along Meridian Road. With the construction of the right turn lane on Bent Grass Meadows Drive, the three RCP culverts will be extended approximately 15' to span the extended width of the roadway. Additionally, two more 45"x29" Elliptical RCP pipes will be installed under Bent Grass Meadows Drive to convey the flows for DP 20. The existing channel will need to lined with a temporary turf reinforcement mat (TRM) due to the excessive velocities (9.91 fps), high shear stress (5.11lbs/ft^2) & high Froude Number (1.12). With the TRM added to the channel sides, the allowable velocity is 25 fps and permissible shear stress is 12 lbs/ft^2. An analysis of the channel with the TRM is provided in the Appendix.

In the future, El Paso County will need to improve the existing culverts and channel to adequately convey the flow outlined in the DBPS. These necessary improvements and associated calculations are described further below. A preliminary grading exhibit has been prepared showing these improvements and included in Appendix C.

Similar to the existing channel, Bentley Flowmaster was also used to design the future proposed channel section. The future channel was designed to have a maximum depth of 5' per the criteria manual and have a maximum velocity of 5 ft/s with a maximum Froude number of 0.6. The flow rate used for the design, 925 cfs, was taken from the Falcon DBPS flow combined with the additional off-site drainage coming from the "School Site" and

The future channel section was designed as trapezoidal shape with a 15' bottom width, 4:1 side slope, and 0.3% longitudinal slope. The total depth of the channel will be 6', providing 1' of freeboard for the 5' of water depth. The velocity of the proposed channel is 4.93 ft/s.

The Federal Highway Administration's HY-8 program was also utilized to design the future culverts that will run beneath Bent Grass Meadows Drive. The calculations included in Appendix C show that in order to adequately convey the 915 cfs in the future conditions, two 16'x4' concrete box culverts will need to replace the existing elliptical RCP's. In order to construct the box culverts, the channel will need to be flattened from downstream to create roughly 5' of additional clearance below the road.

WEST TRIBUTARY

The Falcon Area DBPS made recommendations for the channels as they run through the project site. RWT202 was rerouted on the north property lone to convey flows to RWT204. Improvements were designed as part of the Bent Grass Residential Filing No. 2 development.

Existing RWT204 is grossly oversized for the pre-Bent Grass development flows expected through it, with a 5-year flow of 7 cfs and a 100-year flow for 43 cfs from the DBPS study. The future SCS calculations have a total flow of 181 cfs for the 5-year flow and 1029 cfs for the 100-year flow at DP 40, the location where offsite channel flow enters the Bent Grass development, upstream of the proposed box culvert crossing at Bent Grass Meadows Drive in Reach RWT204. The FEMA flow reported in this section of channel is 1,400 cfs. Improvements to this section of the channel will adhere and be equivalent to the recommendations in the Falcon Basin DBPS.

RWT204 will generally stay in a location similar to where it is in existing conditions but will have new designed channel sections. The channels will have longitudinal slopes flattened to below 1% in order to reduce the scour potential of the channel. Grouted Sloping Boulder Drops may be utilized within the channel as grade controls (maximum height of 4' with 4:1 slope). It is anticipated that 7 grade control structures will be utilized within the channel. This may change when final design of the channel is completed.

RWT210 is the section of the channel south of Bent Grass Meadows Drive and continues south to Woodmen Road. The channel location will shift slightly to the east and "straighten" out the overall flow path. It will be located within a drainage easement. The channel will have a design with a longitudinal slope less than 1.5%, bottom width of 38', and 4:1 side slopes. The Falcon DBPS recommendations for the channel are to remain as a natural drainage channel. Grade control structures may be utilized within the channel to meet design requirements.

Improvements to the existing channel are outlined in the DBPS. At this time, it is assumed that the DBPS recommended channel improvements will be sufficient to handle the final developed channel flow. At the time of final design of the channel, if it is determined that additional improvements are necessary, they will be designed at that time and will be incorporated into the corresponding Final Drainage Report for the

channel improvements. DBPS report and channel plans currently show approximately 16 rock cross vanes in channel Section RWT210. See Appendix C for location and detail of structures.

The West Trib Channel (RWT202, RWT204 & RWT210) will be maintained by the Bent Grass Metropolitan District. For channel improvements offsite of the Falcon Meadows at Bent Grass Filing No. 1 and Bent Grass Residential Filing 2 property, specifically south of the development, it is agreed that the developer will be responsible future channel improvements, south of the development, to the existing improvements north of Woodmen Road if the current property owners have not initiated the future improvements themselves. Or the developer will work with the current property owners to reach an agreement on design/construction, costs, and timing of the channel improvements. An agreement and schedule will be in place prior to approval of Falcon Meadows at Bent Grass Filing No. 1.
And improvements shall be complete within three years of the recordation of Falcon Meadows at Bent Grass Filing No. 4.

IX. Proposed & Future Hydrology Modeling (HEC-HMS)

The updated Falcon Basin DBPS by Matrix looked at several design alternatives for the area to help with undersized ponds throughout the area. The preferred method for dealing with this deficiency was the design and construction of sub-regional ponds throughout the area. The Bent Grass development site impacts one of these ponds, SR4.

The HEC-HMS model, which was used in the Falcon DBPS, was updated. Updates to the model included:

- Meadows Pond #2 stage/storage & stage/elevation data based on stage/storage data in DBPS
- Adding in existing sedimentation pond at “school site” location
- Breaking up Basin MT060 into 3 basins (MT060a, MT060-N & MT060-W) to account “school site” pond
- Updated Pond SR4 based on approved construction drawing information
- Basin MT070 updated to show future improvements within the basin
- Falcon Meadows at Bent Grass turned into a new basin by itself. Undeveloped in Current model & developed in Future Model
- Basins WT200, WT210 revised due to addition of Basin BG

As previously mentioned, the DBPS identified a pond named SR3 at the junction of RWT202 and RWT204 near the south end of the Bent Grass Residential Subdivision. Per the approved FDR for Bent Grass Filing No. 2 and the PDR for Falcon Meadows at Bent Grass, 4 separate water quality ponds will be situated through the Bent Grass site to in lieu of the SR3 pond. The 4 ponds were small enough in volume that they were not incorporated into the HMS model, but are accounted for in the rational modeling within the site.

These on-site water quality pond will treat runoff prior to releasing it into the channel. The two water quality ponds associated with the Bent Grass Filing No. 2 have a volume of approximately 1 acre-foot just for water quality and therefore eliminating the SR3 pond, which never provided detention. The existing channel will remain in place.

X. Proposed Water Quality

The Middle Tributary site does not include the addition of any proposed water quality or detention ponds, under the current scenario. Under future conditions, additional water quality facilities will be necessary for

any new development and detention will be required for new development north of Bent Grass Meadows Drive. Also, in the future conditions scenario, Pond SR-4 and existing Pond MN from the Falcon DBPS will receive flows from the improved school site. The HEC-HMS has been updated and is included in Appendix B. As discussed previously, the "School Site" have been added as an additional Basin MT060a, which is routed to the regional detention facility SR-4.

Basin MT070, described in the Falcon DBPS, was analyzed to include the improvements made to the site within Basin MT070 and the effects it has on existing Pond MN.

From the analysis, Pond SR-4's 100-yr. receiving flows increased from 1,000 cfs to 1072.8 cfs. Based on the increase in impervious area, Basin MT070's Curve Number increased from 67 to 68. Subsequently, the 100-yr. receiving flows entering existing Pond MN decreased to 727.3 cfs from 850 cfs.

Release rates for SR-4 are 14.8 cfs for the 2-year storm and 700.3 cfs for the 100-year storm. Falcon DBPS has 2-year storm listed as 27 cfs and 100-year storm as 730 cfs. This gives a decrease of 12.2 cfs and 29.7 cfs for the 2 and 100-year events respectively.

Pond MN release rates 14.4 cfs for the 2-year storm and 691.7 cfs for the 100-year storm. The DBPS has release rates listed as 32 cfs for the 2-year storm and 820 cfs for the 100-year storm. This gives a decrease of 17.6 cfs and 128.3 cfs for the 2 and 100-year events respectively.

The West Tributary site does include the addition of proposed water quality ponds with the Bent Grass development, under the current scenario. Under future conditions, additional water quality facilities will be necessary for any other new developments. Existing Pond WU, further south in the West Tributary, near Highway 24, is a regional detention facility for areas (approximately 2,312 acres) just upstream of the pond, as well as providing water quality for the west side of the same Falcon Highlands area.

Pond WU release rates 45.9 for the 2-year storm and 921.2 cfs for the 100-year storm. The DBPS has release rates listed as 55 cfs for the 2-year storm and 1000 cfs for the 100-year storm. This gives a decrease of 9.1 cfs and 78.8 cfs for the 2 and 100-year events respectively.

XI. Maintenance

The proposed channels are to be private facilities. They will be maintained by the Bent Grass Metropolitan district. When completion of future DBPS construction improvements and upon the Board of County Commissioners acceptance the channels, Reaches RWT 204 & RWT210, will then be owned and maintained by El Paso County along with all drainage facilities within the public Right-of-Way.

XII. Wetlands Mitigation

No wetlands are located on site.

XIII. Floodplain Statement

According to the Federal Emergency Management Agency (FEMA) Flood Insurance Rate Map number 08041C0553G, effective December 7, 2018, there is a floodplain in a portion of the project area. A copy of the FIRM Panel is included in Appendix A.

The portion of channel that has a floodplain designation is only the RWT210 and RWT204 portions of the channel. It is unknown why the western channel, RWT202 is unmapped since it is the larger contributor

DIVERSION

CHANGE DUE TO BENT GRASS R2 (RWT200)

DELETE POND WITH WQCV REPLACEMENTS & CHANNEL IMPROVEMENTS

PROJECT SITE

CHANGE DUE TO BENT GRASS R1 (RMT063)

LEGEND

Detention Pond
- Existing
- Proposed
- Existing Watershed Boundary
- Historical and Future Watershed Boundary
- Tributary Basin Boundary
- Subbasin Boundary
- Major Tributary
- Immediate Action Required to Preserve Existing Condition

Reach Alternative
- Protect In Place
- Natural Channel Design
- Small Drop Structures w/ Toe Protection

BENT GRASS MDDP & DBPS AMENDMENT EXCERPTS

STAGE-DISCHARGE SIZING OF THE WATER QUALITY CAPTURE VOLUME (WQCV) OUTLET

Project: Falcon Meadows at Bent Grass

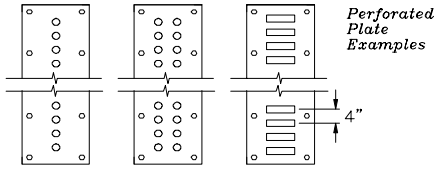
Basin ID: Pond WU

WQCV Design Volume (Input):

Catchment Imperviousness, I_a =	7.3	percent		
Catchment Area, A =	2312.70	acres	Diameter of holes, D =	inches
Depth at WQCV outlet above lowest perforation, H =	6	feet	Number of holes per row, N =	
Vertical distance between rows, h =	12.00	inches	**OR**	
Number of rows, NL =	6.00			
Orifice discharge coefficient, C_o =	0.65		Height of slot, H =	2.00 inches
Slope of Basin Trickle Channel, S =	0.010	ft / ft	Width of slot, W =	7.94 inches
Time to Drain the Pond =	72	hours		

Watershed Design Information (Input):

Percent Soil Type A =	72	%
Percent Soil Type B =		%
Percent Soil Type C/D =	28	%



Outlet Design Information (Output):

Excess Urban Runoff Volume (From 'Full-Spectrum Sheet')	0.043	watershed inches
	N/A	
Excess Urban Runoff Volume (From 'Full-Spectrum Sheet')	**8.246**	**acre-feet**
Outlet area per row, Ao =	9.63	square inches
Total opening area at each row based on user-input above, Ao =	15.88	square inches
Total opening area at each row based on user-input above, Ao =	0.110	square feet

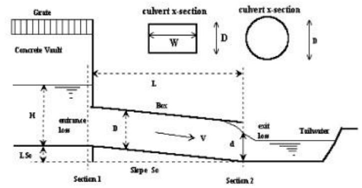
STAGE-DISCHARGE SIZING OF THE OUTLET CULVERT (INLET vs. OUTLET CONTROL WITH TAILWATER EFFECTS)

Project: Bent Grass
Basin ID: Pond WU - Exist 48" Outlet Pipe



Status: Culvert Data is valid!

Design Information (Input):

Circular Culvert:	Barrel Diameter in Inches	D =	48	in.
Circular Culvert:	Inlet Edge Type (choose from pull-down list)		Grooved End with Headwall	
OR:				
Box Culvert:	Barrel Height (Rise) in Feet	Height (Rise) =		ft.
Box Culvert:	Barrel Width (Span) in Feet	Width (Span) =		ft.
Box Culvert:	Inlet Edge Type (choose from pull-down list)		Square Edge w/ 90-15 deg. Flared Wingwall	
	Number of Barrels	No =	1	
	Inlet Elevation at Culvert Invert	I_{elev} =	6816.40	ft. elev.
	Outlet Elevation at Culvert Invert	O_{elev} =	6816.19	ft. elev.
	Culvert Length in Feet	L =	82.5	ft.
	Manning's Roughness	n =	0.0130	
	Bend Loss Coefficient	K_b =	0.00	
	Exit Loss Coefficient	K_x =	0.50	

Design Information (calculated):

Entrance Loss Coefficient	K_e =	
Friction Loss Coefficient	K_f =	
Sum of All Loss Coefficients	K_s =	
Orifice Inlet Condition Coefficient	C_d =	
Minimum Energy Condition Coefficient	KE_{low} =	

Calculations of Culvert Capacity (output):

STAGE-DISCHARGE SIZING OF THE WEIRS AND ORIFICES (INLET CONTROL)

Project: Falcon Meadows at Bent Grass
Basin ID: Pond WU - Existing 60" Outle Pipe - Culvert 1

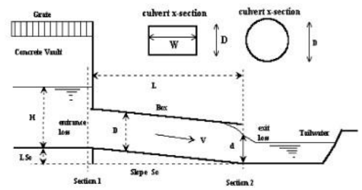
BENT GRASS MDDP & DBPS AMENDMENT EXCERPTS

STAGE-DISCHARGE SIZING OF THE OUTLET CULVERT (INLET vs. OUTLET CONTROL WITH TAILWATER EFFECTS)

Project: Bent Grass
Basin ID: Pond WU - Exist 60" Outlet Pipe - Culvert 2



Status: Culvert Data is valid!

Design Information (Input):

Circular Culvert: Barrel Diameter in Inches	D =	60	in.
Circular Culvert: Inlet Edge Type (choose from pull-down list)		Grooved End with Headwall	
OR:			
Box Culvert: Barrel Height (Rise) in Feet	Height (Rise) =		ft.
Box Culvert: Barrel Width (Span) in Feet	Width (Span) =		ft.
Box Culvert: Inlet Edge Type (choose from pull-down list)		Square Edge w/ 90-15 deg. Flared Wingwall	
Number of Barrels	No =	1	
Inlet Elevation at Culvert Invert	I_{elev} =	6816.11	ft. elev.
Outlet Elevation at Culvert Invert	O_{elev} =	6816.10	ft. elev.
Culvert Length in Feet	L =	82.5	ft.
Manning's Roughness	n =	0.0130	
Bend Loss Coefficient	K_b =	0.00	
Exit Loss Coefficient	K_x =	0.50	

Design Information (calculated):

Entrance Loss Coefficient	K_e =	
Friction Loss Coefficient	K_f =	
Sum of All Loss Coefficients	K_s =	
Orifice Inlet Condition Coefficient	C_d =	
Minimum Energy Condition Coefficient	KE_{low} =	

Calculations of Culvert Capacity (output):

Water Surface Elevation From Sheet "Basin" (ft., linked)	Tailwater Surface Elevation ft (input if known)	Culvert Inlet-Control Flowrate cfs (output)	Culvert Outlet-Control Flowrate cfs (output)	Flowrate Into Culvert From Sheet "Outlet" (cfs, linked)	Controlling Culvert Flowrate cfs (output)	Inlet Equation Used (output)

ENGINEER'S STATEMENT

The attached drainage plan and report were prepared under my direction and supervision and are correct to the best of my knowledge and belief. Said drainage report has been prepared according to the criteria established by the County for drainage reports and said report is in conformity with the applicable master plan of the drainage basin. I accept responsibility for any liability caused by any negligent acts, errors or omissions on my part in preparing this report.

Conditions:

I. General Description

This report is to serve to summarize the design and proposed improvements to the West Tributary to the Falcon Basin (CHWS1400), which will be referred to as the Falcon Meadows Channel through the report. It is proposed to construct 11 grouted sloping boulder drop structures and realign portions of the channel to best work with proposed and future development in the area. The proposed work in the channel will begin at approximately at the north property line of the Falcon Meadows at Bent Grass development and end approximately 200' north of Woodmen Road. No other storm structures are anticipated for the channel design.

The project is located in the Falcon area of El Paso County, Colorado. The site is located in the Northwest ¼ and Southwest ¼ of Section 1, Township 13S, Range 65W, of the Sixth Principal Meridian, County of El Paso, State of Colorado. A Vicinity Map is included in Appendix A.

A portion of the channel has already been realigned along the north boundary line of the Falcon Meadows development, as well as the construction of the twin 16' x 6' concrete box culverts at Bent Grass Meadows Drive, which included a grouted sloping boulder drop structure upstream.

II. Project Background

Falcon Meadows Channel is currently a natural drainageway, running through the Falcon Meadows at Bent Grass development, south to Woodmen Road. The channel continues south under Woodmen Road, eventually entering existing Detention Pond WU in the Falcon Highlands development. The MDDP showed the channel remaining as a natural channel with grade control structures placed throughout to help control velocities and degradation throughout the channel. The channel was to remain as close to natural conditions as possible, with improvements only occurring in the vicinity of the drops/grade control structures.

Due to proposed and future development within the vicinity of the channel, it is now being proposed to add additional drop structures and realign the channel. The channel will be a trapezoidal section with 4:1 side slopes and maintaining an overall channel slope of 0.30% is used to keep the channel flow in a sub-critical flow. Due to the steepness of the site in relation to the 0.30% slope, it is being proposed to use sloping boulder drop structures in lieu of the rock vane grates which had been proposed in the Drainage Basin Planning Study which also showed the channel remaining in its current location.

III. Previous Reports

The proposed site has been included in multiple drainage studies in the past. The following is a composite list of the existing reports pertaining to this site analysis.

1. *Falcon Drainage Basin Planning Study*, by Matrix Design Group, September 2015.
2. *Master Development Drainage Plan – Bent Grass Residential Subdivision*, by Galloway & Company, February 2021 (In Review).
3. *Master Development Drainage Plan and Preliminary Drainage Plan – Bent Grass Subdivision*, by Kiowa Engineering Corporation, December 2006.
4. *Final Drainage Report for Bent Grass Residential (Filing No. 1)*, by Classic Consulting Engineers & Surveyors, LLC, August 2014.
5. *Final Drainage Report Addendum for Bent Grass Residential (Filing No. 1)*, by Classic Consulting Engineers & Surveyors, LLC, August 2015.

6. *Master Development Drainage Plan for The Ranch*, by Classic Consulting Engineers & Surveyors, LLC, November 2018.
7. *Falcon Highlands Master Development Drainage Plan & Preliminary Drainage Report & Final Drainage Report for Filing 1*, by URS, January 2005.
8. *Final Drainage Report and Erosion Control Plan – Latigo Business Center Filing No. 1 A Re-subdivision of a Portion of Latigo Business and Research Center Filing No. 1*, by Kiowa Engineering Corporation, November 2004.
9. *Final Drainage Letter Report for Lot 1, Latigo Business Center Filing No. 1*, by Colorado Design Concepts, April 2005.
10. *Final Drainage and Erosion Control for The Meadows Filing Three Subdivision,* by LADD Engineering, July 2000.
11. *Final Drainage Report Bent Grass Residential Subdivision, Filing No. 2,* Galloway & Company, March 2020.
12. *Preliminary Drainage Report Falcon Meadows at Bent Grass,* by Galloway & Company, February 2021.
13. *Final Drainage Report for Falcon Meadows at Bent Grass Filing No. 1,* by Galloway & Company, under review.

IV. Site Description

The Falcon Area DBPS made recommendations for the channels as they run through the project site. RWT202 was rerouted on the north property lone to convey flows to RWT204. Improvements were designed as part of the Bent Grass Residential Filing No. 2 development.

Existing RWT204 is grossly oversized for the pre-Bent Grass development flows expected through it, with a 5-year flow of 7 cfs and a 100-year flow for 43 cfs from the DBPS study. The future SCS calculations have a total flow of 181 cfs for the 5-year flow and 1029 cfs for the 100-year flow at DP 40, the location where offsite channel flow enters the Bent Grass development, upstream of the existing box culvert crossing at Bent Grass Meadows Drive in Reach RWT204. The FEMA flow reported in this section of channel is 1,400 cfs. Improvements to this section of the channel will adhere and be equivalent to the recommendations in the Falcon Basin DBPS. The HEC-HMS model prepared for the *Bent Grass Residential Subdivision Filing NO. 2 (SF-19-014)* was used to identify the 2-year flow for reach RWT210. This flow rate (70.6 cfs) was utilized to size the low flow portion of the channel.

RWT204 will generally stay in a location similar to where it is in existing conditions but will have new designed channel sections. The channels will have longitudinal slopes flattened to below 1% in order to reduce the scour potential of the channel. Grouted Sloping Boulder Drops will be utilized within the channel as grade controls (maximum height of 5’ with 4:1 slope). Eleven total grade control structures will be utilized within the channel, all the way to Woodmen Road.

RWT210 is the section of the channel south of Bent Grass Meadows Drive and continues south to Woodmen Road. The channel location will shift slightly to the east and “straighten” out the overall flow path. It will be located within a drainage easement. The channel will have a design with a longitudinal slope less than 1%, a composite section including a low flow channel, and 4:1 side slopes. The Falcon DBPS recommendations for the channel are to remain as a natural drainage channel.

The West Trib Channel (RWT202, RWT204 & RWT210) will be maintained by the Bent Grass Metropolitan District. For channel improvements offsite of the Falcon Meadows at Bent Grass Filing No. 1 and Bent Grass Residential Filing 2 property, specifically south of the development, it is agreed that the

developer will be responsible for the channel improvements, south of the development, to the existing improvements north of Woodmen Road if the current property owners have not initiated the improvements themselves, or the developer will work with the current property owners to reach an agreement on design/construction, costs, and timing of the channel improvements. Channel improvements shall be complete within three years of the recordation of Falcon Meadows at Bent Grass Filing No. 4.

V. Hydraulics

Hydraulic analyses were performed to establish a corrected condition, Pre-Project (existing) and Post-Project (proposed) condition for the 100-year storm event. The goals of this evaluation were to document: a) that no existing insurable structures are impacted by the proposed project, and b) that the cumulative increase in the 100-year water surface elevation is below the allowable surcharge amount.

PRE PROJECT (EXISTING) CONDITION:

Description of Improvements:

The previously approved floodplain permit was submitted to accompany the Bent Grass Residential Filing No. 2 project, which is located to the east along a portion of the channel. The proposed condition for the previously approved floodplain permit took into account the twin culverts crossing under Bent Grass Meadows Drive, along with a drop structure just upstream of the structure. The remainder of the channel was left in existing condition with no improvements and ended at Cross Section 2605, just south of the Bent Grass property. This model the basis of the pre-project (existing) condition model for this report. The model was updated to include the relocation of the channel along the north property line and was extended to the south to Woodmen Road.

The Bent Grass Residential Filing No. 2 project was a private development subdivision north of East Woodmen Road in Falcon, Colorado. The project regraded portions of the West Tributary to Falcon Basin (CHWS1400) from a natural channel to a grass lined earthen channel and installed a new road crossing over the channel that conveys water through two 16 feet wide by 6 feet tall reinforced concrete box culverts. The location of these improvements is called out on Figure 1 at the end of this letter. The earthen channel was shown on separate design drawings included in the previously approved Floodplain permit report and construction drawings for the Bent Grass Residential Filing No. 2 project. The channel was designed to be approximately 5 feet deep with 4:1 side slopes and lined with native grass seed. Locations where the channel was to be regraded include Cross Section 5000 towards the northern end of the project area, as well as Cross Sections 4400 through 3800 which correspond to the location of the proposed roadway crossing. The roadway crossing also included a 7.6-foot drop structure upstream of the box culverts that has a 4:1 slope, riprap placed upstream of the drop and downstream of the culverts, and wingwalls at the downstream end. Other improvements that were part of the Bent Grass Residential Filing No. 2 Project include: a) a capture channel along the northern property line that collects upstream flows and convey them into the tributary, b) off-line detention ponds that will detain flows coming from the subdivision offsite.

Hydraulic Analysis:

The pre-project condition hydraulic analysis utilized the previous “proposed” HEC-RAS model from the approved floodplain permit to analyze the 100-year flood event in the existing channel and associated improvements on the Bent Grass Residential Filing No. 2 property. The model boundary condition was not changed from the effective condition model from 2003. In the study reach, a Manning’s *n* value of 0.035 was used in the channel. Sections of the overbank that are to be grass lined during this project were also assigned manning’s n values of 0.035, while undeveloped channel overbanks were assigned a Manning’s *n* of 0.050 corresponding to the effective condition model. The Bent Grass Meadows road crossing was modeled as a 16W’x6’H double barreled reinforced concrete box culvert.

POST PROJECT (PROPOSED) CONDITION:

Description of Improvements:

The Falcon Meadows at Bent Development includes three additional phases of single-family residential subdivisions, along the east and west sides of the existing channel. South of the Falcon Meadows site, there are 3 additional parcels of land, which have future development planned. The remaining entirety of the channel north of Woodmen Road, which has not previously been improved, will regrade the existing channel from a natural channel to a grass lined earthen channel, with 11 drop structures. The proposed earthen channel is shown on separate design drawings and is approximately 5 feet deep with 4:1 side slopes and lined with native grass seed. The alignment of the channel, once it leaves the Falcon Meadows development, was shifted to the east, to allow larger and more useable tracts of land for future development, and not leaving "slivers" of unusable land along the east side of the channel.

Hydraulic Analysis:

The post project condition hydraulic analysis utilized the pre-project HEC-RAS model to analyze the 100-year flood event in the proposed channel and associated improvements thru the West Tributary Channel, to Woodmen Road. The model boundary condition was not changed from the effective condition model from 2003. In the study reach, a Manning's *n* value of 0.035 was used in the channel. Sections of the overbank that are to be grass lined during this project were also assigned manning's n values of 0.035, while undeveloped channel overbanks were assigned a Manning's *n* of 0.050 corresponding to the effective condition model. Manning's n values of 0.04 were used for the channel section at the riprap drop structures and 0.045 at the drop structures overbank areas. See Table **1** for additional Channel Design parameters used in this project.

Table 1: Channel Design Parameters

Design Parameter	Design Value
Maximum 100-year Depth	5 ft
Maximum Velocity*	7 ft/s
Maximum Froude, 100-year*	0.8
Maximum Shear Stress, 100-year*	1.2 lb/sf
Maximum Longitudinal Slope*	0.61%
Side Slope	4:1

*Values are for normal channel section outside of drop structures

The channel has been designed with a composite section. The low flow has been designed to convey the 2-year storm event (70.6 cfs). This results in a 20' wide low flow with 4:1 side slopes. The overbanks are 8' wide on both sides of the low flow channel. The low flow has a standard depth of 1.25' and a velocity less than 3 ft/s and a Froude less than 0.50. FlowMaster calculations for the low flow channel design have been included in the appendices. A shear stress analysis was performed on the low flow channel using North American Green ECMDS software and it showed that the low flow channel remains stable with a significant safety factor. The calculations have been included in the appendices. The riprap protecting the channel through curves with a radius less than 3.0 times the top width will be extended to the toe of the low flow to protect the low flow banks as well as the main channel section. The HEC-RAS model was utilized to calculate the shear stress in the channel for a 100-year storm event. It shows that the channel maintains a normal shear stress less than the 1.2 lb/sf. At the drop structures increased shear stresses can be found on the section upstream of the crest and through the drop itself. The riprap pad upstream of the crest protects the channel from the increased shear in the draw down area of the channel entering the drop

RE: Less Than One-Foot Rise Certification for Falcon Meadows at Bent Grass Channel Design on Unnamed Tributary to Black Squirrel Creek No. 2

Dear Mr. Curtis,

Galloway and Company Inc. is pleased to provide this letter and supporting documentation for the floodplain evaluation of the proposed channel design for the Falcon Meadows at Bent Grass Project along the Unnamed Tributary to Black Squirrel Creek No. 2 in the West Tributary Falcon Basin. Hydraulic analyses were performed to establish a corrected condition, Pre-Project (existing) and Post-Project (proposed) condition for the 100-year storm event. The goals of this evaluation were to document: a) that no existing insurable structures are impacted by the proposed project, and b) that the cumulative increase in the 100-year water surface elevation is below the allowable surcharge amount.

As the floodplain for the Unnamed Tributary to Black Squirrel Creek No. 2 is classified as ZONE AE on the Effective Federal Emergency Management Agency (FEMA) Flood Insurance Rate Map (FIRM), and because there is no regulatory floodway associated with the creek, improvements that encroach on the tributary's floodplain meet the criteria to obtain a floodplain permit through a less than one-foot rise certification with the Pikes Peak Regional Building Department. This certification permits development within the Unnamed Tributary to Black Squirrel Creek No. 2 floodplain as long as the hydraulic study demonstrates that: "the cumulative effect of the proposed development, when combined with all other existing and anticipated development, will not increase the water surface elevation of the base flood elevation more than one-foot at any point within the community." However, in January 2014 the State of Colorado implemented a more stringent floodway surcharge of one-half foot. Therefore, per FEMA's and the Pikes Peak Regional Building Department's floodplain and stormwater regulations, the more stringent guideline governs. Submittal of a Conditional Letter of Map Revision (CLOMR) to FEMA is not anticipated for the current project assuming that the minimum guidelines are satisfied. Due to the drop in water surface elevations, it is a Letter of Map Revision (LOMR) will be submitted to FEMA upon construction of the channel improvements.

In January 2020, a floodplain permit was issued for the channel to include the construction of the box culvert under Bent Grass Meadows Drive and the relocation of the channel to run along the north property boundary before tying into the Unnamed Tributary to Black Squirrel Creek No. 2.

EFFECTIVE CONDITION:

The effective hydraulic and hydrologic conditions for our study reach along the Unnamed Tributary to Black Squirrel Creek No. 2 is documented in the 2003 FEMA approved 'Letter of Map Revision for the West Tributary Falcon Basin Zone A Conversion,' LOMR No.: 03-08-0385P. The study modeled the 100-year floodplain conditions along the Unnamed Tributary to Black Squirrel Creek No. 2 from approximately 200 feet upstream to East Woodmen Road. The current model for the Bent Grass Residential Filing No. 2 Project ties into the effective model at Cross Section 1517, which corresponds to section number 4 in the effective model as well as Cross Section F on the effective FIRM. The effective 100-year utilized peak discharges of 1,450 cfs between Cross Sections 5100 and 3900, and 1,482 cfs from Station 3900 to the downstream study limit of the model at Woodmen Road. LOMR 03-08-0385P and the associated model output file are provided at the end of this letter report. The corrected model in

the previously approved floodplain permit had the model ending at Cross Section 2605, at the southern boundary of the Falcon Meadows property. The corrected model has been expanded to extend all the way to Woodmen Road.

REVISED CORRECTED CONDITION:

The revised corrected condition hydraulic analysis was modeled using HEC-RAS version 5.0.7. The model utilized the effective model's results to establish the hydrology for the analysis. 100-year peak discharges were adopted from the effective results. Manning's *n* values of 0.035 and 0.050 were adopted from the effective model and used in the channel and overbanks. Contraction and expansion coefficients were also adopted from the effective model. The known water surface elevation from the effective model was used as the downstream boundary condition.

With the inclusion of three cross sections from the 2003 study (Sections F-H), the following changes were made in the revised corrected condition model:

1. The 2003 study had been modeled using HEC-2, which has limited modeling capabilities when compared to more recent versions of HEC-RAS. Thus, a new version of the model was created in HEC-RAS v. 5.0.3 and geo-rectified along the Unnamed Tributary to Black Squirrel Creek No. 2 into the NAD83 Colorado State Plane Central (FIPS 0502) projected coordinate system.

2. The 2003 study is comprised of 9 cross sections, 5 of which are located within the study area. Only 3 cross section orientations (4550, 3694, and 2605) were carried over from the 2003 study. Additional cross sections were cut in the revised corrected condition model.

3. Except for the cross sections downstream of the Falcon Meadows boundary (offsite sections), cross sections were cut using updated topographic data that was surveyed by Galloway in April 2019.

In general, revised corrected condition water surface elevations at cross sections corresponding to cross sections from the 2003 study tend to be a foot lower in elevation. This can likely be attributed to the current study utilizing more high-resolution topographic information as well as a more robust model. The 100-year water surface elevations from the revised corrected condition and effective condition are compared in Table 1.

PRE PROJECT (EXISTING) CONDITION:

Description of Improvements:

The previously approved floodplain permit was submitted to accompany the Bent Grass Residential Filing No. 2 project, which is located to the east along a portion of the channel. The proposed condition for the previously approved floodplain permit took into account the twin culverts crossing under Bent Grass Meadows Drive, along with a drop structure just upstream of the structure. The remainder of the channel was left in existing condition with no improvements and ended at Cross Section 2605, just south of the Bent Grass property. This model the basis of the pre-project (existing) condition model for this report. The model was updated to include the relocation of the channel along the north property line and was extended to the south to Woodmen Road.

The Bent Grass Residential Filing No. 2 project was a private development subdivision north of East Woodmen Road in Falcon, Colorado. The project regraded portions of the Unnamed Tributary to Black Squirrel Creek No.2 from a natural channel to a grass lined earthen channel and installed a new road crossing over the channel that conveys water through two 16 feet wide by 6 feet tall reinforced concrete box culverts. The location of these improvements is called out on Figure 1 at the end of this letter. The earthen channel was shown on separate design drawings included in the previously approved

Floodplain permit report and construction drawings for the Bent Grass Residential Filing No. 2 project. The channel was designed to be approximately 5 feet deep with 4:1 side slopes and lined with native grass seed. Locations where the channel was to be regraded include Cross Section 5000 towards the northern end of the project area, as well as Cross Sections 4400 through 3800 which correspond to the location of the proposed roadway crossing. The roadway crossing also included a 7.6-foot drop structure upstream of the box culverts that has a 4:1 slope, riprap placed upstream of the drop and downstream of the culverts, and wingwalls at the downstream end. Other improvements that were part of the Bent Grass Residential Filing No. 2 Project include: a) a capture channel along the northern property line that collects upstream flows and convey them into the tributary, b) off line detention ponds that will detain flows coming from the subdivision offsite.

Hydraulic Analysis:

The pre-project condition hydraulic analysis utilized the previous "proposed" HEC-RAS model from the approved floodplain permit to analyze the 100-year flood event in the existing channel and associated improvements on the Bent Grass Residential Filing No. 2 property. The model boundary condition was not changed from the effective condition model from 2003. In the study reach, a Manning's *n* value of 0.035 was used in the channel. Sections of the overbank that are to be grass lined during this project were also assigned manning's n values of 0.035, while undeveloped channel overbanks were assigned a Manning's *n* of 0.050 corresponding to the effective condition model. The Bent Grass Meadows road crossing was modeled as a 16W'x6'H double barreled reinforced concrete box culvert.

The following changes were made to the pre-project condition model in order to evaluate the 100-year event associated with the post project condition:

1. Ancillary cross sections that were not close to proposed improvements were removed while additional cross sections were cut closer to the improvements.

2. Flow lengths were reassigned to accommodate the changes in cross section configurations.

3. Cross sections 4100 and 4050 were replaced with the 16'Wx6'H double barreled reinforced

4. concrete box culvert and associated design road with both low and high chords.

5. Cross section geometries were revised to reflect the proposed grade within the Unnamed Tributary to Black Squirrel Creek No. 2.

6. Cross sections were revised to better model and map back water areas.

7. Channel was extended to the south to Woodmen Road

POST PROJECT (PROPOSED) CONDITION:

Description of Improvements:

The Falcon Meadows at Bent Development includes three additional phases of single family residential subdivisions, along the east and west sides of the existing channel. South of the Falcon Meadows site, there are 3 additional parcels of land, which have future development planned. The remaining entirety of the channel north of Woodmen Road, which has not previously been improved, will regrade the existing channel from a natural channel to a grass lined earthen channel, with 11 drop structures. The proposed earthen channel is shown on separate design drawings and is approximately 5 feet deep with 4:1 side slopes and lined with native grass seed. The alignment of the channel, once it leaves the Falcon Meadows development, was shifted to the east, to allow larger and more useable

tracts of land for future development, and not leaving “slivers” of unusable land along the east side of the channel.

Hydraulic Analysis:

The post project condition hydraulic analysis utilized the pre-project HEC-RAS model to analyze the 100-year flood event in the proposed channel and associated improvements thru the Unnamed Tributary Channel, to Woodmen Road. The model boundary condition was not changed from the effective condition model from 2003. In the study reach, a Manning’s *n* value of 0.035 was used in the channel. Sections of the overbank that are to be grass lined during this project were also assigned manning’s n values of 0.035, while undeveloped channel overbanks were assigned a Manning’s *n* of 0.050 corresponding to the effective condition model. Manning’s n values of 0.04 were used for the channel section at the riprap drop structures and 0.045 at the drop structures overbank areas.

The following changes were made to the post-project condition model in order to evaluate the 100-year event associated with the post project condition:

1. Ancillary cross sections that were not close to proposed improvements were removed while additional cross sections were cut closer to the improvements.

2. Flow lengths were reassigned to accommodate the changes in cross section configurations.

3. Cross section geometries were revised to reflect the proposed grade within the Unnamed Tributary to Black Squirrel Creek No. 2.

4. Realignment of the offsite channel section, south of Falcon Meadows development, to allow for more useable parcels of land available for development.

Conclusions:

Based on the results depicted on Figure 1 and Table 1 the following conclusions are drawn:

1. The 100-year water surface elevations are generally lower from the corrected to the proposed condition.

2. The maximum increase of 0.3 is noted at Cross Section 4152, which is within the maximum increase of 0.5 feet allowed by the State of Colorado.

3. The indicated rises in the 100-year water surface elevations do not impact any insurable structures.

If you have any questions or comments about any of the information presented in this letter, please do not hesitate to contact us.

Sincerely,
GALLOWAY

Allowable Rise Certification

I certify that I am a duly qualified registered Professional Engineer licensed in the state of Colorado.

Using standard Engineering practice, I have evaluated the floodplain in the area of the proposed project, and I have determined pre-project 100-year flood depths. I certify that the cumulative effects of the proposed Bent Grass Residential Filing No. 2 Project as detailed in the associated construction drawings will result in less than a half-foot rise in the 100-year flood elevations that I have determined for Unnamed Tributary to Black Squirrel Creek No. 2 which is shown on FEMA FIRM 08041C0553G. This certification is intended as proof of meeting the requirements set forth in the Federal Code 44CFR Chp. 1, 60.3.c.10.

I offer the following documentation in accordance with standard Engineering practice to support my findings:

a) **The Effective Firm Panel**

b) **The Current Study**

SHEET INDEX

BENCHMARK

ELEVATIONS ARE BASED ON THE SOUTHWEST CORNER OF LOT1, WOODMEN HILLS FILING NO. 4, MONUMENTED BY A NO. 4 REBAR WITH A YELLOW PLASTIC CAP, STAMPED LS# 24954. ELEVATION = 6947.67

BASIS OF BEARING

ALL BEARINGS ARE GRID BEARINGS OF THE COLORADO STATE PLANE COORDINATE SYSTEM, CENTRAL ZONE, NORTH AMERICAN DATUM 1983. THE BEARING OF THE LINE BETWEEN THE SOUTHWEST CORNER OF SECTION 1, T13S, R65W AND THE WEST QUARTER CORNER SECTION 1, T13S, R65W IS N00°13'46"W AND MONUMENT AS SHOWN.

NOTE: CONTRACTOR SHALL PROTECT ALL EXISTING SURVEY MONUMENTATION. CONTRACTOR SHALL HAVE LICENSED SURVEYOR REPLACE ANY DAMAGED OR DISTURBED MONUMENTATION AT THEIR COST.

SURVEYOR TO OBTAIN AUTOCAD FILE FROM ENGINEER AND VERIFY ALL HORIZONTAL CONTROL DIMENSIONING PRIOR TO CONSTRUCTION STAKING. SURVEYOR MUST VERIFY ALL BENCHMARK, BASIS OF BEARING AND DATUM INFORMATION TO ENSURE IMPROVEMENTS WILL BE AT THE SAME HORIZONTAL AND VERTICAL LOCATIONS SHOWN ON THE DESIGN CONSTRUCTION DRAWINGS. PRIOR TO CONSTRUCTION STAKING ANY DISCREPANCY MUST BE REPORTED TO OWNER AND ENGINEER PRIOR TO CONTINUATION OF ANY FURTHER STAKING OR CONSTRUCTION WORK.

CAUTION – NOTICE TO CONTRACTOR

1. ALL UTILITY LOCATIONS SHOWN ARE BASED ON MAPS PROVIDED BY THE APPROPRIATE UTILITY COMPANY AND FIELD SURFACE EVIDENCE AT THE TIME OF SURVEY AND IS TO BE CONSIDERED AN APPROXIMATE LOCATION ONLY. IT IS THE CONTRACTOR'S RESPONSIBILITY TO FIELD VERIFY THE LOCATION OF ALL UTILITIES, PUBLIC OR PRIVATE, WHETHER SHOWN ON THE PLANS OR NOT, PRIOR TO CONSTRUCTION. REPORT ANY DISCREPANCIESTO THE ENGINEER PRIOR TO CONSTRUCTION.

Know what's below. Call before you dig.

2. WHERE A PROPOSED UTILITY CROSSES AN EXISTING UTILITY, IT IS THE CONTRACTOR'S RESPONSIBILITY TO FIELD VERIFY THE HORIZONTAL AND VERTICAL LOCATION OF SUCH EXISTING UTILITY, EITHER THROUGH POTHOLING OR ALTERNATIVE METHOD. REPORT INFORMATION TO THE ENGINEER PRIOR TO CONSTRUCTION.

ENGINEER'S STATEMENT

THESE DETAILED PLANS AND SPECIFICATIONS WERE PREPARED UNDER MY DIRECTION AND SUPERVISION. SAID PLANS AND SPECIFICATIONS HAVE BEEN PREPARED ACCORDING TO THE CRITERIA ESTABLISHED BY THE COUNTY FOR DETAILED ROADWAY, DRAINAGE, GRADING AND EROSION CONTROL PLANS AND SPECIFICATIONS, AND SAID PLANS AND SPECIFICATIONS ARE IN CONFORMITY WITH APPLICABLE MASTER DRAINAGE PLANS AND MASTER TRANSPORTATION PLANS. SAID PLANS AND SPECIFICATIONS MEET THE PURPOSES FOR WHICH THE PARTICULAR ROADWAY AND DRAINAGE FACILITIES ARE DESIGNED AND ARE CORRECT TO THE BEST OF MY KNOWLEDGE AND BELIEF. I ACCEPT RESPONSIBILITY FOR ANY LIABILITY CAUSED BY ANY NEGLIGENT ACTS, ERRORS OR OMISSIONS ON MY PART IN PREPARATION OF THESE DETAILED PLANS AND SPECIFICATIONS.

COLORADO LICENSED
SCOTT MICHAEL BROWN

ENGINEER'S STATEMENT

The attached drainage plan and report were prepared under my direction and supervision and are correct to the best of my knowledge and belief. Said drainage report has been prepared according to the criteria established by the County for drainage reports and said report is in conformity with the applicable master plan of the drainage basin. I accept responsibility for any liability caused by any negligent acts, errors or omissions on my part in preparing this report.

Conditions:

west property line of the site at **DP 9**. The runoff will continue to sheet flow through Basin EX-6 to the south until entering the existing drainage swale on the southern boundary of Basin EX-6 at **DP 11**.

Basin OS-3 (10.62 AC, Q5 = 4.7 cfs, Q100 = 22.7 cfs) is associated with The Meadows Filing No. 1 lot 11 and The Meadows Filing No. 2 Lots 1 & 2. Runoff from this basin sheet flows from the northwest to the southeast, crossing the west property line of the site at **DP 10**. The runoff will continue to sheet flow through Basin EX-6 to the south until entering the existing drainage ditch on the southern boundary of Basin EX-6 at **DP 11**.

Basin OS-4 (4.46 AC, Q5 = 5.6 cfs, Q100 = 14.0 cfs) is associated with The Bent Grass Residential Filing No. 2, lots 152-160, lots 163-168, Tract D, and portions of Thedford Court & Willmore Drive. Runoff from this basin flows via curb & gutter south on Thedford Court then continues flowing west along the northern curb & gutter along Willmore Drive before discharging into southeast corner of Basin EX-2 at **DP 1**.

Basin OS-5 (0.46 AC, Q5 = 1.1 cfs, Q100 = 2.3 cfs): is associated with The Bent Grass Residential Filing No. 2, lots 161 & 162 along with a portion of Silky Thread Road. Runoff from this basin generally flows to the west via curb & gutter along Silky Thread Road before discharging into the northeast corner of Basin EX-2 at **DP 2**.

Basin OS-6 (1.17 AC, Q5 = 2.0 cfs, Q100 = 4.3 cfs): is associated with The Bent Grass Residential Filing No. 2, the northern halves of Lots 170-178 and a portion of the southern side of Willmore Drive. Runoff from this basin generally flows to the west via curb & gutter along Willmore Drive before discharging into the northeast corner of Basin EX-3 at **DP 3**.

Basin E-1 (1.71 AC, Q5 = 3.6 cfs, Q100 = 7.7 cfs): a basin that is east of Falcon Meadows and encompasses the north portion of Bent Grass Meadows Drive. A high point on the far East of the basin at the near the Filing No. 2 boundary, forces water to flow to a low point at **DP-8**, which represents an existing 20' CDOT Type R sump inlet, which conveys stormwater via proposed 36" RCP storm sewer to the existing Filing No. 2 north water quality detention pond. Emergency overflow will spill over the crown of the road and enter into an existing 10' CDOT Type R sump inlet on the south side of Bent Grass Meadows Drive.

Basin E-2 (0.68 AC, Q5 = 2.4 cfs, Q100 = 4.6 cfs): a basin that is in west of Basin E-1 and encompasses a portion of the north section Bent Grass Meadows Drive. A high point on the far West of the basin forces water to flow to a low point at **DP-8**, which represents an existing 20' CDOT Type R sump inlet, which conveys stormwater via a proposed 36" RCP storm sewer to the existing Filing No. 2 north water quality detention pond. Emergency overflow will spill over the crown of the road and enter into an existing 10' CDOT Type R sump inlet on the south side of Bent Grass Meadows Drive.

Basin E-3 (0.78 AC, Q5 = 2.9 cfs, Q100 = 5.3 cfs): a basin that is south of Basin E-2 and encompasses a portion of the south half of Bent Grass Meadows Drive. A high point on the far West of the basin forces water to flow to a low point at **DP-7**, which is an existing 10' CDOT Type R sump inlet, which conveys stormwater via an existing 24" storm sewer to **DP-8**. This inlet receives emergency overflow from DP-8.

Basin E-4 (0.91 AC, Q5 = 3.0 cfs, Q100 = 5.7 cfs): a basin that is in the Southwest area of the Bent Grass Filing No. 2 site and encompasses a portion of the north and west sections of Bent Grass Meadows Drive. Runoff from this basin is captured by existing curb and gutter and then routed South where the 5 yr. and 100 yr. flows will be captured by an existing 25' CDOT Type R (1-10' and 1-15' inlet) on-grade inlet, **DP-24**. Captured flow will be routed by a 24" RCP storm drain piped to DP-25. A

temporary water quality facility will treat this flow for the Bent Grass Filing No. 2 development and will remain in place until further development occurs.

Basin E-5 (0.89 AC, Q5 = 3.3 cfs, Q100 = 6.1 cfs): a basin that is in the Southwest area of the site and encompasses a portion of south and east sections Bent Grass Meadows Drive. Runoff from this basin is captured by existing curb and gutter and then routed South where the 5 yr. and 100 yr. flows will be captured by a proposed 25' CDOT Type R (1-10' and 1-15' inlet) on-grade inlet, **DP-25**. Captured flow will be routed by a 24" RCP storm drain piped to an outfall at DP-26, where a temporary sediment basin will provide water quality for the basin. Flows will then be routed East by Existing Swale – F until out-falling into RWT210.

Basin I-1 (0.31 AC, Q5 = 1.0 cfs, Q100 = 2.1 cfs): a basin that is associated with Latigo Business Center Filing No. 1 lot 1. It encompasses a portion of Bent Grass Meadows Parkway South of the existing (2) 10' & (2) 15' CDOT Type R Inlets on Bent Grass Meadows Drive, near the south property line. There are a set of on-grade inlets (20' on the east side, 15' on the west side), which will intercept this flow. Inlets will then release flows to the east into an existing drainage swale. Based on the Latigo Business Park drainage report by Kiowa Engineering, inlets were designed for flows of 9.9 and 21.2 cfs from this basin. The development of the Bent Grass site has reduced the flows entering the Latigo Business Park site, ensuring the existing storm system will continue to function adequately.

Basin C-8 (0.42 AC, Q5 = 0.2 cfs, Q100 = 1.0 cfs): a basin that is in the South-central area of the site adjacent to RWT204 and RWT 210. It encompasses the rears of single-family residential Type B lots from Bent Grass Residential Filing No. 2. Runoff will sheet flow West directly into RWT204 and RWT210.

Design Point CC is the location in channel reach RWT210, where flows exit the Bent Grass Site, including the offsite flows from RWT202, RWT204 and WT200. The minor flow is 272.5 cfs and the major flow is 1209.6 cfs based on the rational flows. The MDDP (which has been submitted concurrently for review) has minor flows exiting the site of 278.3 cfs and major flow of 1224.7 cfs based on rational calculations for the project site.

VI. Four Step Process

The Four Step Process is used to minimize the adverse impacts of urbanization and is a vital component of developing a balanced, sustainable project. Below identifies the approach to the four-step process:

1. Employ Runoff Reduction Practices

The proposed development uses Low Impact Development (LID) practices to reduce runoff at the source. Rather than creating point discharges that are directly connected to impervious areas, runoff is routed through pervious areas to promote infiltration. Grass buffers and swales are used where practical.

2. Stabilize Drainageways

This step implements stabilization to channels to accommodate developed flows while protecting infrastructure and controlling sediment loading from erosion in the drainageways. Erosion protection in the form of riprap pads at all outfall points to the channel to prevent scouring of the channel from point discharges. A HEC-RAS model has been created and used to evaluate the stability of the existing channels. It has been determined that given that the channel is stable in its current state and

proposed project. These areas were studied as part of the Falcon Basin DBPS prepared by Matrix and were also part of the Bent Grass MDDP, submitted in June for review. Refer to the MDDP for the discussion of the revisions made to the HEC-HMS model. There have been no changes to these basins as they are offsite and existing.

Design Point CC is the location in channel reach RWT210, where flows exit the Bent Grass Site, including the offsite flows from RWT202, RWT204 and WT200. The minor flows are 271.7 cfs and the major flows are 1186.3 cfs. The MDDP Amendment, from the HEC-HMS model, has flows of 191.8 cfs and 1075.3 cfs for the 5 and 100-year flows under proposed/future conditions analysis. The FEMA FIS report has a total flow of 1400 cfs in channel reach RWT210.

VIII. Storm Sewer System

All development is anticipated to be urban and will include storm sewer & street inlets. Storm sewers collect storm water runoff and convey the water to water quality facilities prior to discharging. Storm sewer systems will be designed to the 100-year storm and checked with the 5-year storm. Inlets will be placed at sump areas and intersections where street flow is larger than street capacity. UDFCD Inlet spreadsheet will be used to determine the size of all at-grade and sump inlets. There will be a minimum of 1 proposed storm system and two existing system within the site. There will be two future storm systems with subsequent filings of Falcon Meadows, as the area develops north of Bent Grass Meadows Drive. The first future storm system will collect flows on the north and east side of the project, prior to entering Bent Grass Meadows Drive. Intercepted flows will be released into the Bent Grass Filing No. 2 water quality facility, Pond 1. Any bypass flows will travel west in Bent Grass Meadows Drive to an existing storm system in the roadway.

The second future storm system will collect the north and west portion of the site, intercepting flows prior to entering Bent Grass Meadows Drive. These flows will be released into the future North water quality pond. Any flows bypassed from the storm system will enter Bent Grass Meadows Drive and travel east to the existing storm sewer system.

The proposed system has been designed for the remaining south and west portion of the project. Flows intercepted by inlets will be released into the proposed South water quality pond. All design calculations (StormCAD, inlet design & street capacity spreadsheets, etc.) have been included in Appendix C for this system.

The inlets located within Bent Grass Meadows Drive (DP-8, DP-24 and DP-25) were all designed under the FDR for Bent Grass Residential Filing No. 2. The inlets were “rechecked” based on updated flows reaching each of these design points. The analysis of these inlets is included in Appendix C.

Final drainage reports for future filings will include details concerning inlet location, street capacity, storm sewer sizing, outlet protection and location for the future storm systems.

IX. Proposed Water Quality Detention Ponds

One Water Quality Capture Volume Detention Pond (South) will be provided for the Falcon Meadows at Bent Grass Filing No. 1 site. A future pond (North) will be provided for the area north of Bent Grass Meadows Drive, as part of future Falcon Meadows at Bent Grass developments. The proposed pond will be private and will only provide water quality. The EURV and 100-year volumes will be conveyed via the emergency overflow weir, which will be lined. The water quality volume release will be controlled with an

The Falcon Area DBPS made recommendations for the channels as they transverse the project site. Bent Grass Residential Filing No. 2 included rerouting RWT202 along the north property line to convey flows to RWT204. Improvements to RWT202 were also included in Bent Grass Residential Filing No. 2.

RWT204 is grossly oversized for the actual anticipated flows. The Falcon Basin DBPS included a 5-year flow of 7 cfs and a 100-year flow for 43 cfs. The proposed rational calculations have a total flow of 270 cfs for the 5-year flow and 1189 cfs for the 100-year flow at DP AA (box culvert crossing at Bent Grass Meadows Drive in Reach RWT204). The FEMA flow reported in this section of channel is 1,400 cfs. Improvements to RWT204, north of Bent Grass Meadows Drive, will adhere and be equivalent to the recommendations in the Falcon Basin DBPS.

RWT204 will generally stay in its existing location but will have new designed channel sections. The channel will have longitudinal slopes flattened to below 1% in order to reduce the scour potential of the channel. Grouted Sloping Boulder Drops may be utilized within the channel as grade controls (maximum height of 4' with 4:1 slope). 7 grade control structures are anticipated within the channel. This may change when final design of the channel is completed.

RWT210 is the section of the channel south of Bent Grass Meadows Drive and continues south to Woodmen Road. The channel location will shift slightly to the east and "straighten" out the overall flow path. It will be located within a drainage easement. The channel will have a design including a longitudinal slope less than 1.5%, bottom width of 38', and 4:1 side slopes. The Falcon DBPS recommendations for the channel are to remain as a natural drainage channel. Grade control structures may be utilized within the channel to meet design requirements.

At this time, it is assumed that the DBPS recommended channel improvements will be sufficient to handle the final developed channel flow. DBPS report and channel plans currently show approximately 16 rock cross vanes in channel Section RWT210. See Appendix F for preliminary location and detail of structures. Final design will be included in the channel improvement package submittal.

The West Trib Channel (RWT202, RWT204 & RWT210) will be maintained by the Bent Grass Metropolitan District. For channel improvements offsite of the Falcon Meadows at Bent Grass Filing No. 1 and Bent Grass Residential Filing 2 property, specifically south of the development, it is agreed that the developer will be responsible future channel improvements, south of the development, to the existing improvements north of Woodmen Road if the current property owners have not initiated the future improvements themselves. Or the developer will work with the current property owners to reach an agreement on design/construction, costs, and timing of the channel improvements. An agreement and schedule will be in place prior to approval of Falcon Meadows at Bent Grass Filing No. 1. And improvements shall be complete within three years of the recordation of Falcon Meadows at Bent Grass Filing No. 4.

XI. Maintenance

The channel is to be a private facility until all DBPS identified improvements are complete. Once the DBPS improvements are completed, maintenance for the channel will transition to El Paso County. The proposed water quality pond is to be privately maintained. Private facilities will be maintained by the Bent Grass Metropolitan District. After completion of construction and upon the Board of County Commissioners acceptance, all public drainage facilities within easements and public Right-of-Way will be owned and maintained by El Paso County. Channel improvements will be considered under the final drainage report for the channel improvement design package.

FALCON MEADOWS @ BENT GRASS FILING NO.1
FDR EXCERPTS

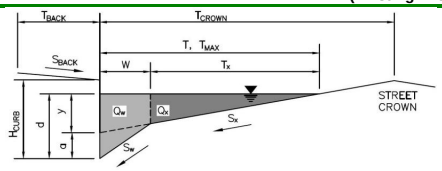
Version 4.06 Released August 2018

ALLOWABLE CAPACITY FOR ONE-HALF OF STREET (Minor & Major Storm)

(Based on Regulated Criteria for Maximum Allowable Flow Depth and Spread)

Project: Falcon Meadows at Bent Grass

Inlet ID: DP 24 (Existing Inlet)



Gutter Geometry (Enter data in the blue cells)

Maximum Allowable Width for Spread Behind Curb	T_{BACK} =	14.0	ft

ENGINEER'S STATEMENT:

The attached final drainage plan and report were prepared under my direction and supervision and are correct to the best of my knowledge and belief. Said drainage report has been prepared according to the criteria established by the City/County for drainage reports and said report is in conformity with the master plan of the drainage basin. I accept responsibility for any liability caused by any negligent acts, errors or omissions on my part in preparing this report.

Conditions:

to develop the peak flow data for the major drainageways within the Falcon Area basin. The impact of the higher curve numbers in the West Tributary watershed is to raise the estimated 100-year discharge at Woodmen Road from 1640 cubic feet per second as reported in the DBPS to 1890 cubic feet per second. The revised hydrologic analysis also considers that the regional detention facilities as proposed for the Falcon Hills development that lies north in the watershed of the greater Latigo Business Center.

Presented on Figures 3 and 4 are the local sub-basin peak flow data for the existing and proposed development conditions, respectively. Runoff rates were determined for the 5-year and 100-year recurrence intervals as specified in the City/County Storm Drainage Criteria Manual (DCM). The rational formula was applied in this report for the local sub-basins. Peak discharge data for the existing and proposed development conditions were determined for the 5-year and 100-year recurrence intervals. The rainfall intensities for the 5-year and 100-year recurrence intervals were obtained from the Rainfall Intensity curves contained within the DCM. Runoff coefficients and time of concentration estimates for the areas within and offsite to Filing No. 1 were estimated using the recommended values provided in the DCM. The hydrologic calculations are contained within the Appendix A of this Report.

The drainage basin offsite from Filing No. 1 (OS-1) is presently undeveloped land. Future development planning information for OS-1 indicates that the area will be developed as single-family residential. The runoff from offsite basin OS-1 in its present condition will have to be routed through developed basins 1 and 1A at the time of construction within Lot 1. When the area covered by OS-1 develops, the runoff from OS-1 will be routed to the Bent Grass Meadows Boulevard street section where a storm sewer system built with Filing 1 will be provided. The routing of the proposed runoff from OS-1 to the Bent Grass Meadows Boulevard street section will be accomplished through grading of the lots to the local streets so that the developed flow will not enter Lot 1.

DEVELOPED SUB-BASIN DESCRIPTIONS

Sub-basins 1 and 1A: These sub-basins cover substantially all of proposed Lot 1. In the graded condition, the sub-basin will have mild to moderate slopes ranging between 2 to 3 percent. The area of sub-basin 1 is approximately 3.4 acres. Peak discharges for sub-basin 1 is estimated at 11.1 and 22.0 cubic feet per second for the five-year and 100-year frequencies respectively. Peak discharges for sub-basin 1A are estimated at 13.9 and 27.6 cubic feet per second for the five-year and 100-year frequencies respectively. These sub-basins will discharge to south lot line of Lot 1 where the runoff will be picked up in a private swale. The swale will in turn discharge to the storm sewer and channel outfall

system proposed within sub-basin 2. This runoff routing is consistent with the routing assumed in the preliminary drainage report for the Business Center. The existing runoff from offsite basin OS-1 drains into sub-basin 1A. The existing runoff from OS-1 will have to be accounted for when Lot 1 develops.

Sub-basin 6: This sub-basin covers approximately the eastern one-half of the Falcon School District Service Center (that is, Lot 2). This sub-basin has slopes ranging from four to five percent. Peak discharges for this sub-basin are estimated at 21.1 and 41.7 cubic feet per second for the five-year and 100-year frequencies respectively. This sub-basin presently discharges to the Bent Grass Meadows Boulevard right-of-way and to the roadside swale along Woodmen Road where proposed Bent Grass Meadows Boulevard intersects with Woodmen Road. There will be no runoff from sub-basin 1 that will enter sub-basin 6 in the proposed condition.

Sub-basin 7: This sub-basin covers approximately western one-half of the Falcon School District Service Center (that is, Lot 2). This sub-basin has slopes ranging from four to five percent. Peak discharges for this sub-basin are estimated at 22.0 and 43.4 cubic feet per second for the five-year and 100-year frequencies respectively. This sub-basin discharges to the existing swale along Woodmen Road that drains west to an existing 18-inch culvert under Woodmen Road approximately 100-feet west of the southwest corner of sub-basin 7. The 18-inch culvert under 3exsitng Woodmen Road has been discussed above in this report. There will be no runoff from sub-basin 1 that will enter sub-basin 7 in the proposed condition and therefore the total flow contributed to the existing 18-inch attributable to sub-basin 7 will not be changed from the present condition.

HYDRAULICS

The design and layout of the required onsite drainage improvements were carried out in accordance with the City/County Storm Drainage Criteria Manual. Calculations that support the sizing of the onsite drainage facilities are contained within Appendix B of this report. There are no existing storm drainage facilities within the site. The proposed drainage facilities are presented on Figure 4. Calculations that support the drainage facilities shown on Figure 4 are contained within Appendix B.

The primary conveyances of developed runoff within and through the site are proposed as storm sewers and grass-lined swales. All grass-lined swales will be initially stabilized with erosion control fabric and revegetated with native grasses. .

A storm sewer system has been proposed for Bent Grass Meadows Boulevard in order to collect developed runoff from sub-basins 1, 1A, 6 and OS-1. The system will

Randy DeYoung, Cable Plus, Inc.

By: Randy DeYoung

Title: President

Address: 2790 North Academy Suite 110

El Paso County's Statement:

Filed in accordance with Section 51.1 of the El Paso Land Development Code, as amended.

for John McCarty, County Engineer/Director Date 4-18-05

Conditions:

Basin 7 contains 0.31 acres along the southern boundary of the site. It is mostly landscaped area. It slopes to the east via a ditch to design point 10. Basin 7 generates flows of 1.0 cfs and 2.1 cfs for the 5-year and 100-year storms.

Design Point analysis

Design Point 1 is located south of Basin Off-1. The Flows at DP-1 will be capture by future drainage structures design for this site. The flows from design point 1 are not routed through the site. They will be directed to the east to Bent Grass Meadows Blvd..
DP-2 is located at the east end of Basin 2. At DP-2, runoff from Basin 2 is discharge into the ditch along the eastern boundary of the site. Runoff at DP-2 is routed to the curb chase at DP-2. Flows at design point 2 are 1.2 cfs and 2.2 cfs for the 5-year and 100-year storms.

DP-3 is located at the south end of Basin 3 at a CDOT Type D inlet. Runoff from design point 2 is routed to design point 3. Routed flows of 3.8 cfs and 7.4 cfs are produced at design point 3. Runoff from design point 3 is routed to design point 4 at the discharge of the drainage structure.

DP-4 is located at the north end of Basin 6. Flow at design point 4 is routed south to design point 5 at a storm drain opening.

DP-5 is located is located at the south end of Basin 6 at a storm drain opening. Flows of 6.7 cfs and 12.9 cfs are produced at design point 5.

DP-6 is located at the south end of basin Off-2. Flows at DP-6 discharge onto the site and into Basin 4. Design point 6 is routed through Basin 4 to design point 7. Flows of 0.2 cfs and 0.5 cfs are produced for the 5-year and 100-year storms at design point 6.

DP-7 is located in the south end of Basin 4. A 24-inch storm drain intercepts flow at design point 7. The flows at design point 7 are 12.5 cfs and 23.2 cfs for the 5-year and 100-year storms.

DP-8 is located at a CDOT type D inlet at the southeast corner of Basin 5. All runoff form Basin 5 is intercepted at the inlet at design point 8. Intercepted flows at design point 8 are 13.6 cfs and 25.1 cfs for the 5-year and 100-year storms.

DP-9 is located at a manhole east of design point 8. Design point 9 is part of a storm drain system and includes routed flows from design points 5 and 8. Routed flows at design point 9 are 18.7 cfs and 35.0 cfs for the 5-year and 100-year storms. Flows are routed from design point 9 to design point 10.

DP-10 is located at a 4-foot box manhole with a grated lid south of design point 9. The manhole intercepts flow from Basin 7 and combines it with routed flow from design points 7 and 9. The flows at design point 10 are 30.9 cfs and 57.8 cfs for the 5-year and 100-year storms.

DP-11 is located at Bent Grass Meadows Blvd. inlet. Design point 11 is the connection point with the onsite and offsite storm drain system. The flows at design point 11 are 31.8 cfs and 59.6

cfs for the 5-year and 100-year storms. These flows are very close to the 31.9 cfs and 63.5 cfs as calculated in the Kiowa Final Drainage Report.

Storm Drain Design

The site includes a storm drain system that discharges into the Bent Grass Meadows Blvd. inlet. The storm drain system consists of ditches, inlets and storm drain pipes. The majority of the pipe is 24-inch diameter with a small portion of 30-inch diameter pipe from design point 10 to design point 11. All the ditches and structures have been design to carry the 100-year storm without overtopping the top of the ditch or flooding adjacent property. This is a private drainage system and the developer will be required to provide maintenance for the life of the system.

Erosion Control

Silt fence will be placed around the perimeter of the property except for the northern boundary. Riprap or equivalent river rock will be placed at inlet locations and along slopes greater than 3:1. Haybails will be placed along swales spaced as shown on the Grading and Erosion Control Plan.

Miscellaneous

Best erosion control practices will be utilized as deemed necessary by the Contractor or Engineer and are not limited to the measures described above.

NOTES:
$T_i = (0.395*(1.1 - C_5)*(L)^0.5)/((S)^0.33)$, S in ft/ft
T_t=L/60V (Velocity From Fig. 501)
Velocity V=Cv*S^0.5, S in ft/ft
Tc Regional = (L/180) + 10
For Urbanized basins a minimum T_c of 5.0 minutes is required.
For non-urbanized basins a minimum T_c of 10.0 minutes is required

NOTES:
$T_i = (0.395*(1.1 - C_5)*(L)^0.5)/((S)^0.33)$, S in ft/ft
T_t=L/60V (Velocity From Fig. 501)
Velocity V=Cv*S^0.5, S in ft/ft
Tc Regional = (L/180) + 10
For Urbanized basins a minimum T_c of 5.0 minutes is required.
For non-urbanized basins a minimum T_c of 10.0 minutes is required

Project: Aug15_Working_Falcon_DBPS_S

Simulation Run: FU 2-yr Reservoir: Regional Pond WU South

Start of Run:	01Jan2011, 00:00	Basin Model:	Falcon_DBPS_Future
End of Run:	02Jan2011, 00:00	Meteorologic Model:	2-yr
Compute Time:	09Feb2026, 22:28:39	Control Specifications:	24-hr Storm

Volume Units: ○ IN ◉ AC-FT

Computed Results

Peak Inflow :	134.4 (CFS)	Date/Time of Peak Inflow :	01Jan2011, 06:39
Peak Outflow :	47.3 (CFS)	Date/Time of Peak Outflow :	01Jan2011, 09:39
Total Inflow :	33.2 (AC-FT)	Peak Storage :	8.3 (AC-FT)
Total Outflow :	27.0 (AC-FT)	Peak Elevation :	6821.5 (FT)

ALLOWABLE CAPACITY FOR ONE-HALF OF STREET (Minor & Major Storm)

(Based on Regulated Criteria for Maximum Allowable Flow Depth and Spread)

Project: **The Markets At Bent Grass (Proposed Inlets)**

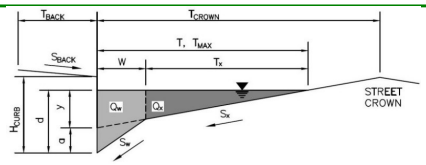
Inlet ID: **Basin WA-2 (DP A2)**



Gutter Geometry:

Maximum Allowable Width for Spread Behind Curb	T_{BACK} =	12.0	ft
Side Slope Behind Curb (leave blank for no conveyance credit behind curb)	S_{BACK} =	0.015	ft/ft
Manning's Roughness Behind Curb (typically between 0.012 and 0.020)	n_{BACK} =	0.020	
Height of Curb at Gutter Flow Line	H_{CURB} =	6.00	inches
Distance from Curb Face to Street Crown	T_{CROWN} =	32.0	ft
Gutter Width	W =	2.00	ft
Street Transverse Slope	S_X =	0.020	ft/ft
Gutter Cross Slope (typically 2 inches over 24 inches or 0.083 ft/ft)	S_W =	0.083	ft/ft
Street Longitudinal Slope - Enter 0 for sump condition	S_O =	0.000	ft/ft
Manning's Roughness for Street Section (typically between 0.012 and 0.020)	n_{STREET} =	0.016	

		Minor Storm	Major Storm	
Max. Allowable Spread for Minor & Major Storm	T_{MAX} =	12.0	32.0	ft
Max. Allowable Depth at Gutter Flowline for Minor & Major Storm	d_{MAX} =	6.0	8.0	inches
Check boxes are not applicable in SUMP conditions		☐	☐	

Maximum Capacity for 1/2 Street based On Allowable Spread

		Minor Storm	Major Storm	
Water Depth without Gutter Depression (T * S_x * 12)	y =	2.88	7.68	inches
Vertical Depth between Gutter Lip and Gutter Flowline (W * S_w * 12)	d_C =	2.0	2.0	inches
Gutter Depression (d_C - (W * S_x * 12))	a =	1.51	1.51	inches
Water Depth at Gutter Flowline (y + a)	d =	4.39	9.19	inches
Allowable Spread for Discharge outside the Gutter Section (T - W)	T_X =	10.0	30.0	ft
Gutter Flow to Design Flow Ratio by FHWA HEC-22 method (Eq. 7-7)	E_O =	0.491	0.181	
Discharge outside the Gutter Section, carried in Section T_X	Q_X =	0.0	0.0	cfs
Discharge within the Gutter Section (Q_T - Q_X - Q_{BACK})	Q_W =	0.0	0.0	cfs
Discharge Behind the Curb (e.g., sidewalk, driveways, & lawns)	Q_{BACK} =	0.0	0.0	cfs
Maximum Flow Based On Allowable Spread	**Q_T =**	**SUMP**	**SUMP**	**cfs**
Flow Velocity within the Gutter Section	V =	0.0	0.0	fps
V*d Product: Flow Velocity times Gutter Flowline Depth	V*d =	0.0	0.0	

Maximum Capacity for 1/2 Street based on Allowable Depth

		Minor Storm	Major Storm	
Theoretical Water Spread	T_{TH} =	18.7	27.0	ft
Theoretical Spread for Discharge outside the Gutter Section (T - W)	$T_{X\,TH}$ =	16.7	25.0	ft
Gutter Flow to Design Flow Ratio by FHWA HEC-22 method (Eq. 7-7)	E_O =	0.318	0.216	
Theoretical Discharge outside the Gutter Section, carried in Section $T_{X\,TH}$	$Q_{X\,TH}$ =	0.0	0.0	cfs

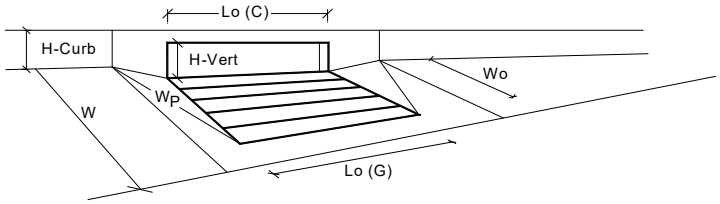
INLET IN A SUMP OR SAG LOCATION

MHFD-Inlet, Version 6.00 (August 2025)



Design Information (Input)		MINOR	MAJOR	
Type of Inlet (Colorado Springs D-10-R)	Type =	Colorado Springs D-10-R		
Local Depression (additional to continuous gutter depression 'a' from above)	a_{local} =	4.00	4.00	inches
Number of Unit Inlets (Grate or Curb Opening)	No =	1	1	
Water Depth at Flowline (outside of local depression)	Ponding Depth =	6.0	8.0	inches
Grate Information		MINOR	MAJOR	☑ Override Depths
Length of a Unit Grate	L_o (G) =	N/A	N/A	feet
Width of a Unit Grate	W_o =	N/A	N/A	feet
Open Area Ratio for a Grate (typical values 0.15-0.90)	A_{ratio} =	N/A	N/A	
Clogging Factor for a Single Grate (typical value 0.50 - 0.70)	C_f (G) =	N/A	N/A	
Grate Weir Coefficient (typical value 2.15 - 3.60)	C_w (G) =	N/A	N/A	
Grate Orifice Coefficient (typical value 0.60 - 0.80)	C_o (G) =	N/A	N/A	
Curb Opening Information		MINOR	MAJOR	
Length of a Unit Curb Opening	L_o (C) =	5.00	5.00	feet
Height of Vertical Curb Opening in Inches	H_{vert} =	8.00	8.00	inches
Height of Curb Orifice Throat in Inches	H_{throat} =	8.00	8.00	inches
Angle of Throat	Theta =	81.00	81.00	degrees
Side Width for Depression Pan (typically the gutter width of 2 feet)	W_p =	2.00	2.00	feet
Clogging Factor for a Single Curb Opening (typical value 0.10)	C_f (C) =	0.10	0.10	
Curb Opening Weir Coefficient (typical value 2.3-3.7)	C_w (C) =	3.60	3.60	
Curb Opening Orifice Coefficient (typical value 0.60 - 0.70)	C_o (C) =	0.67	0.67	
Grate Flow Analysis (Calculated)		MINOR	MAJOR	
Clogging Coefficient for Multiple Units	Coef =	N/A	N/A	
Clogging Factor for Multiple Units	Clog =	N/A	N/A	
Grate Capacity as a Weir (based on MHFD - CSU 2010 Study)		MINOR	MAJOR	
Interception without Clogging	Q_{wi} =	N/A	N/A	cfs
Interception with Clogging	Q_{wa} =	N/A	N/A	cfs
Grate Capacity as an Orifice (based on MHFD - CSU 2010 Study)		MINOR	MAJOR	
Interception without Clogging	Q_{oi} =	N/A	N/A	cfs
Interception with Clogging	Q_{oa} =	N/A	N/A	cfs
Grate Capacity as Mixed Flow		MINOR	MAJOR	
Interception without Clogging	Q_{mi} =	N/A	N/A	cfs
Interception with Clogging	Q_{ma} =	N/A	N/A	cfs
Resulting Grate Capacity (assumes clogged condition)	**Q_{Grate} =**	**N/A**	**N/A**	**cfs**
Curb Opening Flow Analysis (Calculated)		MINOR	MAJOR	
Clogging Coefficient for Multiple Units	Coef =	1.00	1.00	
Clogging Factor for Multiple Units	Clog =	0.10	0.10	
Curb Capacity as a Weir (based on MHFD - CSU 2010 Study)		MINOR	MAJOR	
Interception without Clogging	Q_{wi} =	6.0	11.0	cfs
Interception with Clogging	Q_{wa} =	5.4	9.9	cfs
Curb Capacity as an Orifice (based on MHFD - CSU 2010 Study)		MINOR	MAJOR	
Interception without Clogging	Q_{oi} =	12.7	14.7	cfs
Interception with Clogging	Q_{oa} =	11.5	13.2	cfs
Curb Opening Capacity as Mixed Flow		MINOR	MAJOR	
Interception without Clogging	Q_{mi} =	8.1	11.8	cfs
Interception with Clogging	Q_{ma} =	7.3	10.6	cfs
Resulting Curb Opening Capacity (assumes clogged condition)	**Q_{Curb} =**	**5.4**	**9.9**	**cfs**
Resultant Street Conditions		MINOR	MAJOR	
Total Inlet Length	L =	5.00	5.00	feet
Resultant Street Flow Spread (based on street geometry from above)	T =	18.7	27.0	ft
Resultant Flow Depth at Street Crown	d_{CROWN} =	0.0	0.0	inches
Low Head Performance Reduction (Calculated)		MINOR	MAJOR	
Depth for Grate Midwidth	d_{Grate} =	N/A	N/A	ft
Depth for Curb Opening Weir Equation	d_{Curb} =	0.33	0.50	ft
Grated Inlet Performance Reduction Factor for Long Inlets	RF_{Grate} =	N/A	N/A	
Curb Opening Performance Reduction Factor for Long Inlets	RF_{Curb} =	1.00	1.00	
Combination Inlet Performance Reduction Factor for Long Inlets	$RF_{Combination}$ =	N/A	N/A	
		MINOR	MAJOR	
Total Inlet Interception Capacity (assumes clogged condition)	**Q_a =**	**5.4**	**9.9**	**cfs**
Inlet Capacity IS GOOD for Minor and Major Storms (>Q Peak)	$Q_{PEAK\ REQUIRED}$ =	1.6	3.0	cfs

DETENTION BASIN OUTLET STRUCTURE DESIGN

MHFD-Detention, Version 4.07 (June 2025)

Summary Stage-Area-Volume-Discharge Relationships

The user can create a summary S-A-V-D by entering the desired stage increments and the remainder of the table will populate automatically.
The user should graphically compare the summary S-A-V-D table to the full S-A-V-D table in the chart to confirm it captures all key transition points.

Stage - Storage Description	Stage [ft]	Elevation [ft]	Area [ft^2]	Area [acres]	Volume [ft^3]	Volume [ac-ft]	Total Outflow [cfs]

For best results, include the stages of all grade slope changes (e.g. ISV and Floor) from the S-A-V table on Sheet 'Basin'.

Also include the inverts of all outlets (e.g. vertical orifice, overflow grate, and spillway, where applicable).
