## I. Introduction

### Project Overview

This traffic impact study addresses the capacity, geometric, and control requirements associated with the development entitled Prospect Park at Fountain & Union.

This proposed mixed-use development consists of a variety of land uses including commercial and residential. The development is located on the southeast corner of E Fountain Boulevard and S Union Boulevard in Colorado Springs, Colorado.

### Study Area Boundaries

The study area to be examined in this analysis encompasses the E Fountain Boulevard intersections with S Union Boulevard, Stewart Place, and Boggs Place, and also includes all proposed site access intersections.

Figure 1 illustrates location of the site and study intersections.

### Site Description

Land for the development is currently vacant and surrounded by a mix of open space, public, religious, residential, commercial, and institutional land uses. A small portion of the development is currently occupied by a vacant building previously used as a restaurant land use.

The proposed development is conceptual and specific land uses have not been fully determined. However, for purposes of this analysis, it is anticipated that the development will include the new construction of an approximate 4,400 square foot convenience market with gas station supporting 14 vehicle fueling positions, as well as approximately 38,100 square feet of shopping center land uses and up to 391 multifamily residential dwelling units. It is noted that the assumed shopping center square footage is based on a Floor-Area-Ratio (FAR) calculation of 0.25. This FAR is considered typical for a development of this type and is consistent with City standard FAR allowances.

Proposed access to the development is provided at the following locations: two full-movement accesses onto S Union Boulevard (referred to as Access A and Access B), one right-in/right-out access onto S Union Boulevard (referred to as Access C), and three full-movement accesses onto E Fountain Boulevard (referred to as Access D, Access E, and Access F). Access D and Access E are extensions of Stewart Place and Boggs Place, respectively, south of E Fountain Boulevard. Additionally, it is noted that pursuant to the approved concept plan, a potential right-in/right-out access was originally proposed onto E Fountain Boulevard between S Union Boulevard and Stewart Place. However, it is understood that this access is no longer anticipated to be included with the current development plan. As such, this access is not analyzed within this analysis. This provides for a conservative analysis.

For purposes of this study, it is anticipated that development construction would be completed by end of Year 2022.

A conceptual site plan, as prepared by N.E.S., Inc., is shown on Figure 2. This plan is provided for illustrative purposes.

Traffic Impact Study

## Existing and Committed Surface Transportation Network

Within the study area, E Fountain Boulevard and S Union Boulevard are the primary roadways that will accommodate traffic to and from the proposed development. The secondary roadways include Stewart Place and Boggs Place. A brief description of each roadway is provided below:

E Fountain Boulevard is an east-west principal arterial roadway having four through lanes (two lanes in each direction) with a combination of shared and exclusive turn lanes at the intersections within the study area. E Fountain Boulevard provides a posted speed limit of 40 MPH.

S Union Boulevard is a north-south principal arterial roadway having four through lanes (two lanes in each direction) with a combination of shared and exclusive turn lanes at the intersection within the study area. S Union Boulevard provides a posted speed limit of 30 MPH in either direction north of E Fountain Boulevard and 40 MPH in either direction south of E Fountain Boulevard.

Stewart Place is a north-south roadway having two through lanes (one lane in each direction) with shared turn lanes at the intersection within the study area. Stewart Place is unclassified in the City's major transportation thoroughfare plan<sup>1</sup>. However, per Sections 15.0 and 16.0 of the City's design standards<sup>2</sup>, the roadway's estimated ROW width, and connection to E Fountain Boulevard, Stewart Place is assumed to be classified as a collector roadway with a 30 MPH posted speed limit, with the premise that the roadway's average daily traffic (ADT) is less than or equal to 2,500 vehicles per day, allowing for residential frontage per existing conditions.

Boggs Place is a north-south roadway having two through lanes (one lane in each direction) with shared turn lanes at the intersection within the study area. Boggs Place is unclassified in the City's major transportation thoroughfare plan. However, per Sections 15.0 and 16.0 of the City's design standards, the roadway's estimated ROW width, and connection to E Fountain Boulevard, Boggs Place is assumed to be classified as a collector roadway with a posted speed limit of 30 MPH, with the presumption that the roadway's ADT is less than or equal to 2,500 vehicles per day, allowing for residential frontage per existing conditions. Boggs Place ends at Manitoba Drive and continues north as Tahoe Boulevard.

The study intersection of E Fountain Boulevard with S Union Boulevard is signalized. All other study intersections operate under a stop-controlled condition. A stop-controlled intersection is defined as a roadway intersection where vehicle rights-of-way are controlled by one or more "STOP" signs.

No regional or specific improvements for E Fountain Boulevard, S Union Boulevard, or other described roadways are known to be planned or committed at this time. The study area roadways appear to be built to their ultimate cross-sections.

---

<sup>1</sup> Major Thoroughfare Plan, City of Colorado Springs, August 2011.

<sup>2</sup> Engineering Criteria Manual, Section III: Traffic Criteria Manual, City of Colorado Springs City Engineering, July 2010.

## II. Existing Traffic Conditions

Morning (AM) and afternoon (PM) peak hour traffic counts were collected at the E Fountain Boulevard intersections with S Union Boulevard, Stewart Place, and Boggs Place. Average daily (24-hour) traffic volumes were collected on E Fountain Boulevard and S Union Boulevard. These counts are shown on Figure 3.

It should be noted that due to the effects of the COVID-19 pandemic, traffic volumes collected may not accurately represent peak hour and 24-hour traffic volumes under normal conditions. Therefore, in order to more accurately represent existing traffic volumes under normal conditions, average daily traffic volumes along S Union Boulevard, provided from the City's GIS web mapping application<sup>3</sup>, were used and grown at a two percent annual growth rate to Year 2020. This calculated 24-hour traffic volume was then compared to the collected count data. Upon comparison, it was determined that collected traffic count data is similar to existing traffic volumes under normal conditions. Therefore, no adjustments to collected counts were made. These counts are shown on Figure 3.

Traffic count data is included for reference in Appendix A.

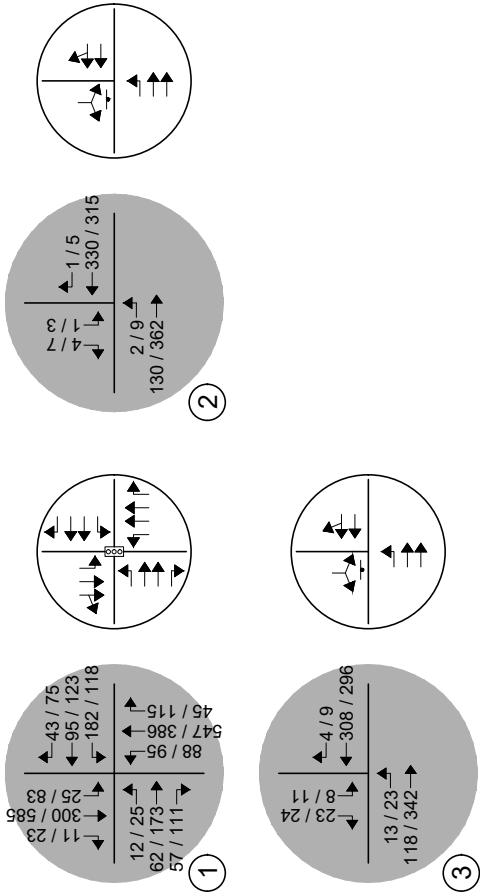

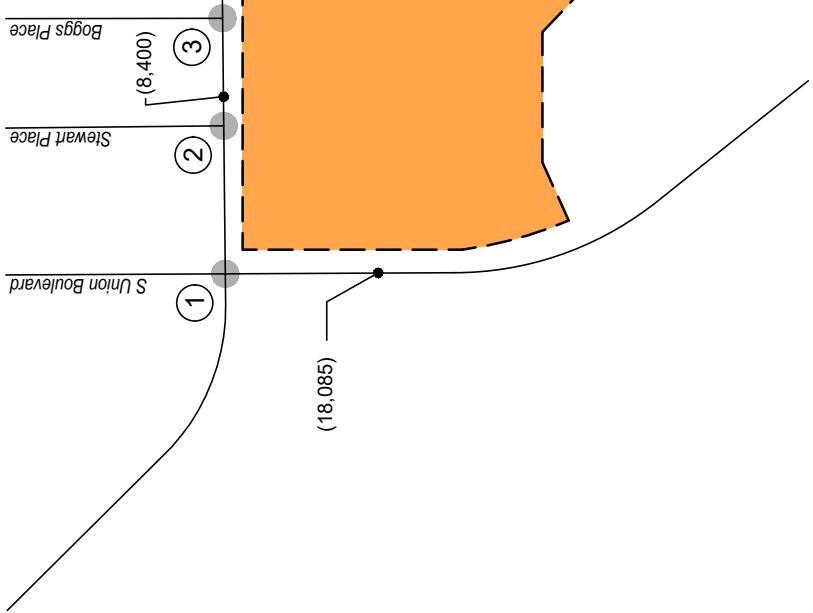

Existing signal timing parameters for E Fountain Boulevard and S Union Boulevard were obtained from City Staff and used throughout this study to the best extent possible in order to remain consistent with existing signal coordination plans. City signal timing information received is included for reference in Appendix A.

AM / PM Peak Hour  
(ADT) : Average Daily Traffic

The Signalized and Unsignalized Intersection Analysis techniques, as published in the Highway Capacity Manual (HCM) by the Transportation Research Board and as incorporated into the SYNCHRO computer program, were used to analyze the study intersections for existing traffic conditions. These nationally accepted techniques allow for the determination of intersection level of service (LOS) based on the congestion and delay of each traffic movement.

Level of service is a method of measurement used by transportation professionals to quantify a driver's perception of travel conditions that include travel time, number of stops, and total amount of stopped delay experienced on a roadway network. The HCM categorizes level of service into a range from "A" which indicates little, if any, vehicle delay, to "F" which indicates a level of operation considered unacceptable to most drivers. These levels of service grades with brief descriptions of the operating condition, for unsignalized and signalized intersections, are included for reference in Appendix B and have been used throughout this study.

The level of service analyses results for existing conditions are summarized in Table 1.

Intersection capacity worksheets developed for this study are provided in Appendix C.

**Table 1 – Intersection Capacity Analysis Summary – Existing Traffic**

INTERSECTION LANE GROUPS	LEVEL OF SERVICE	
	AM PEAK HOUR	PM PEAK HOUR
E Fountain Boulevard / S Union Boulevard (Signalized)	C (21.2)	C (20.1)
E Fountain Boulevard / Stewart Place (Stop-Controlled) Eastbound Left Southbound Left and Right	A A	A A
E Fountain Boulevard / Boggs Place (Stop-Controlled) Eastbound Left Southbound Left and Right	A A	A B

Key: Signalized Intersection: Level of Service (Control Delay in sec/veh)  
Stop-Controlled Intersection: Level of Service

## Existing Traffic Analysis Results

Under existing conditions, operational analysis shows that the signalized intersection of E Fountain Boulevard with S Union Boulevard has overall operations at LOS C during both morning and afternoon peak traffic hours.

The unsignalized intersection of E Fountain Boulevard with Stewart Place has turn movement operations at LOS A during both morning and afternoon peak traffic hours.

The unsignalized intersection of E Fountain Boulevard with Boggs Place has turn movement operations at LOS A during morning peak traffic hours and LOS B or better during afternoon peak traffic hours.

### **III. Future Traffic Conditions Without Proposed Development**

Background traffic is the traffic projected to be on area roadways without consideration of the proposed development. Background traffic includes traffic generated by development of vacant parcels in the area.

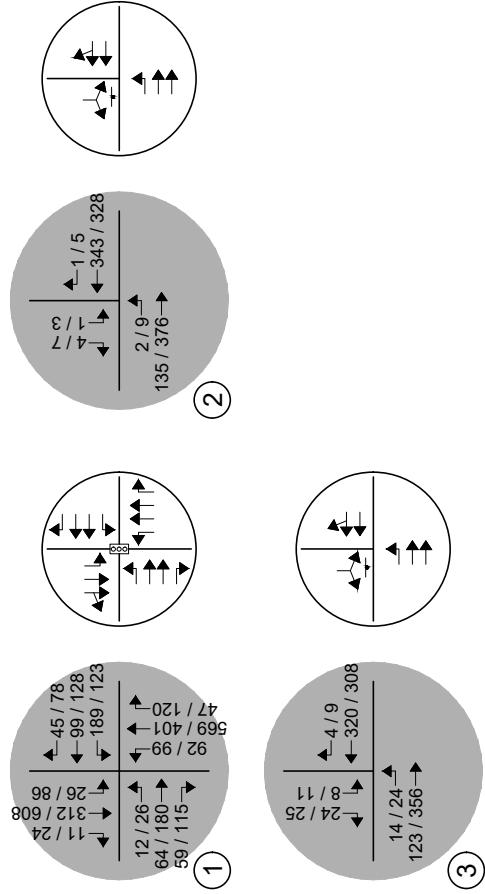

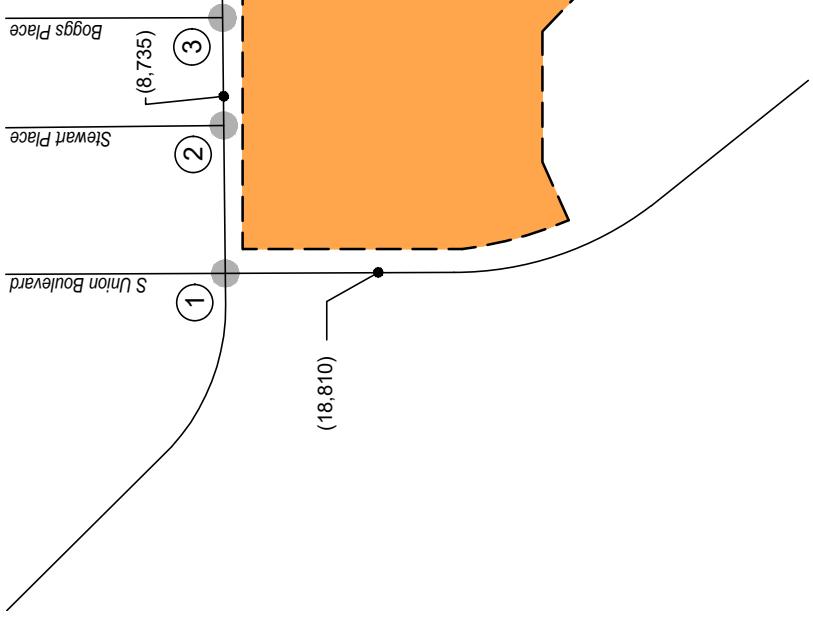

To account for projected increases in background traffic for Years 2022 and 2040, a compounded annual growth rate was determined using traffic data provided by CDOT's Online Transportation Information System (OTIS) for the adjacent segment of U.S. Highway 24, which anticipates a 20-year growth rate less than two percent. Therefore, in order to provide for a conservative analysis, a growth rate of approximately two percent was applied to existing traffic volumes.

Pursuant to the non-committed area roadway improvements discussed in Section I, Year 2022 and Year 2040 background traffic conditions assume no roadway improvements to accommodate regional transportation demands. Year 2040 assumes existing signal timing parameters for E Fountain Boulevard and S Union Boulevard with optimized intersection splits in effort to better long-term intersection performance. This assumption provides for a conservative analysis.

Projected background traffic volumes and intersection geometry for Years 2022 and 2040 are shown on Figure 4 and Figure 5, respectively.

E Fountain Boulevard / Boggs Place (Stop-Controlled) Eastbound Left Southbound Left and Right	A B	A B

Key: Signalized Intersection: Level of Service (Control Delay in sec/veh)  
Stop-Controlled Intersection: Level of Service

### Background Traffic Analysis Results – Year 2022

Year 2022 background traffic analysis indicates that the signalized intersection of E Fountain Boulevard with S Union Boulevard has overall operations at LOS C during both the morning and afternoon peak traffic hours.

The unsignalized intersection of E Fountain Boulevard with Stewart Place shows turn movement operations at LOS A during both morning and afternoon peak traffic hours.

The unsignalized intersection of E Fountain Boulevard with Boggs Place has turn movement operations at LOS B or better during both morning and afternoon peak traffic hours.

**Table 3 – Intersection Capacity Analysis Summary – Background Traffic – Year 2040**

INTERSECTION LANE GROUPS	LEVEL OF SERVICE	
	AM PEAK HOUR	PM PEAK HOUR
E Fountain Boulevard / S Union Boulevard (Signalized)	C (22.4)	C (23.8)
E Fountain Boulevard / Stewart Place (Stop-Controlled) Eastbound Left Southbound Left and Right	A B	A B
E Fountain Boulevard / Boggs Place (Stop-Controlled) Eastbound Left Southbound Left and Right	A B	A B

Key: Signalized Intersection: Level of Service (Control Delay in sec/veh)

Stop-Controlled Intersection: Level of Service

### Background Traffic Analysis Results – Year 2040

By Year 2040 and without the proposed development, the study intersection of E Fountain Boulevard with S Union Boulevard continues to experience LOS C operations during both morning and afternoon peak traffic hours.

The stop-controlled intersection of E Fountain Boulevard with Stewart Place anticipates turn movement operations at LOS B or better during both morning and afternoon peak traffic hours.

The stop-controlled intersection of E Fountain Boulevard with Boggs Place projects turn movement operations at LOS B or better during both morning and afternoon peak traffic hours.

These intersection operations are similar to existing conditions.

## IV. Proposed Project Traffic

### Trip Generation

Standard traffic generation characteristics compiled by the Institute of Transportation Engineers (ITE) in their report entitled Trip Generation Manual, 10<sup>th</sup> Edition, were applied to the proposed land use in order to estimate average daily traffic (ADT), AM Peak Hour, and PM Peak Hour vehicle trips. A vehicle trip is defined as a one-way vehicle movement from a point of origin to a point of destination.

The ITE land use codes 221 (Multifamily Housing (Low-Rise)), 820 (Shopping Center), and 960 (Super Convenience Market/Gas Station) were used for estimating trip generation because of their conservative trip generation rates, their best fit to the proposed land use descriptions, and as permitted for the existing Planned Business Center zoning defined within the City's code<sup>4</sup>.

As noted in Section I, assumed shopping center square footage is based on an FAR of 0.25. Multifamily housing units were determined based on the maximum allowable number of dwelling units per acre. As actual land uses, densities or site plans within the development area become defined over time, it is expected that traffic generation characteristics considered within this study will need to be updated by more specific traffic analyses or studies to help assess if transportation improvements are needed to mitigate potential traffic impacts.

Trip generation rates used in this study are presented in Table 4.

**Table 4 – Trip Generation Rates**

ITE CODE	LAND USE	UNIT	TRIP GENERATION RATES						
			24 HOUR	AM PEAK HOUR			PM PEAK HOUR		
				ENTER	EXIT	TOTAL	ENTER	EXIT	TOTAL
221	Multifamily Housing (Low-Rise)	DU	7.32	0.11	0.35	0.46	0.35	0.21	0.56
820	Shopping Center	KSF	37.75	0.58	0.36	0.94	1.83	1.98	3.81
960	Super Convenience Market/Gas Station	KSF	837.58	41.57	41.57	83.14	34.64	34.64	69.28

Key: KSF = Thousand Square Feet Gross Floor Area. DU = Dwelling Units.

Note: All data and calculations above are subject to being rounded to nearest value.

<sup>4</sup> Colorado Springs, Colorado City Code, Sterling Codifiers, December 12, 2017.

Table 5 illustrates projected average daily traffic (ADT), AM Peak Hour, and PM Peak Hour traffic volumes likely generated by the proposed development upon build-out.

**Table 5 – Trip Generation Summary**

ITE CODE	LAND USE	SIZE	TOTAL TRIPS GENERATED						
			24 HOUR	AM PEAK HOUR			PM PEAK HOUR		
				ENTER	EXIT	TOTAL	ENTER	EXIT	TOTAL
221	Multifamily Housing (Low-Rise)	391 DU	2,862	41	138	180	138	81	219
820	Shopping Center	38.1 KSF	1,439	22	14	36	70	76	145
960	Super Convenience Market/Gas Station	4.4 KSF	3,706	184	184	368	153	153	307
<i>Total:</i>			8,007	248	336	584	361	310	671

Note: All data and calculations above are subject to being rounded to nearest value.

Upon build-out, Table 5 illustrates that the proposed development has the potential to generate approximately 8,007 daily trips with 584 of those occurring during the morning peak hour and 671 during the afternoon peak hour.

### Adjustments to Trip Generation Rates

While a development of this type is likely to attract trips from within area land uses as well as pass-by or diverted linked trips from the adjacent roadway system, no trip reduction was taken in this analysis. This assumption provides for a conservative analysis.

As example, published ITE pass-by and diverted link trip data indicates an average trip generation reduction rate between 46 and 78 percent as typical to service stations with convenience store. Considering the lowest reduction percentage, primary trip generation for the proposed development equates to approximately half of trip generation volumes presented in Table 5. A primary trip is defined by ITE as a trip made for the specific purpose of visiting the destination generator.

Additionally, it is noted that given the combination of both commercial and residential land uses, it is likely some amount of trips generated will have both origin and destination within the overall development area. These internally captured trips would result in an overall reduction to the anticipated trip generation presented in Table 5. However, given the conceptual nature of the proposed development, a specific percentage of internal capture can only be assumed. Therefore, no reduction was considered.

## **Trip Distribution**

The overall directional distribution of site-generated traffic was determined based on the location of development site within the City, proposed and existing area land uses, allowed turning movements, and available roadway network.

Overall trip distribution patterns for the development are shown on Figure 6.

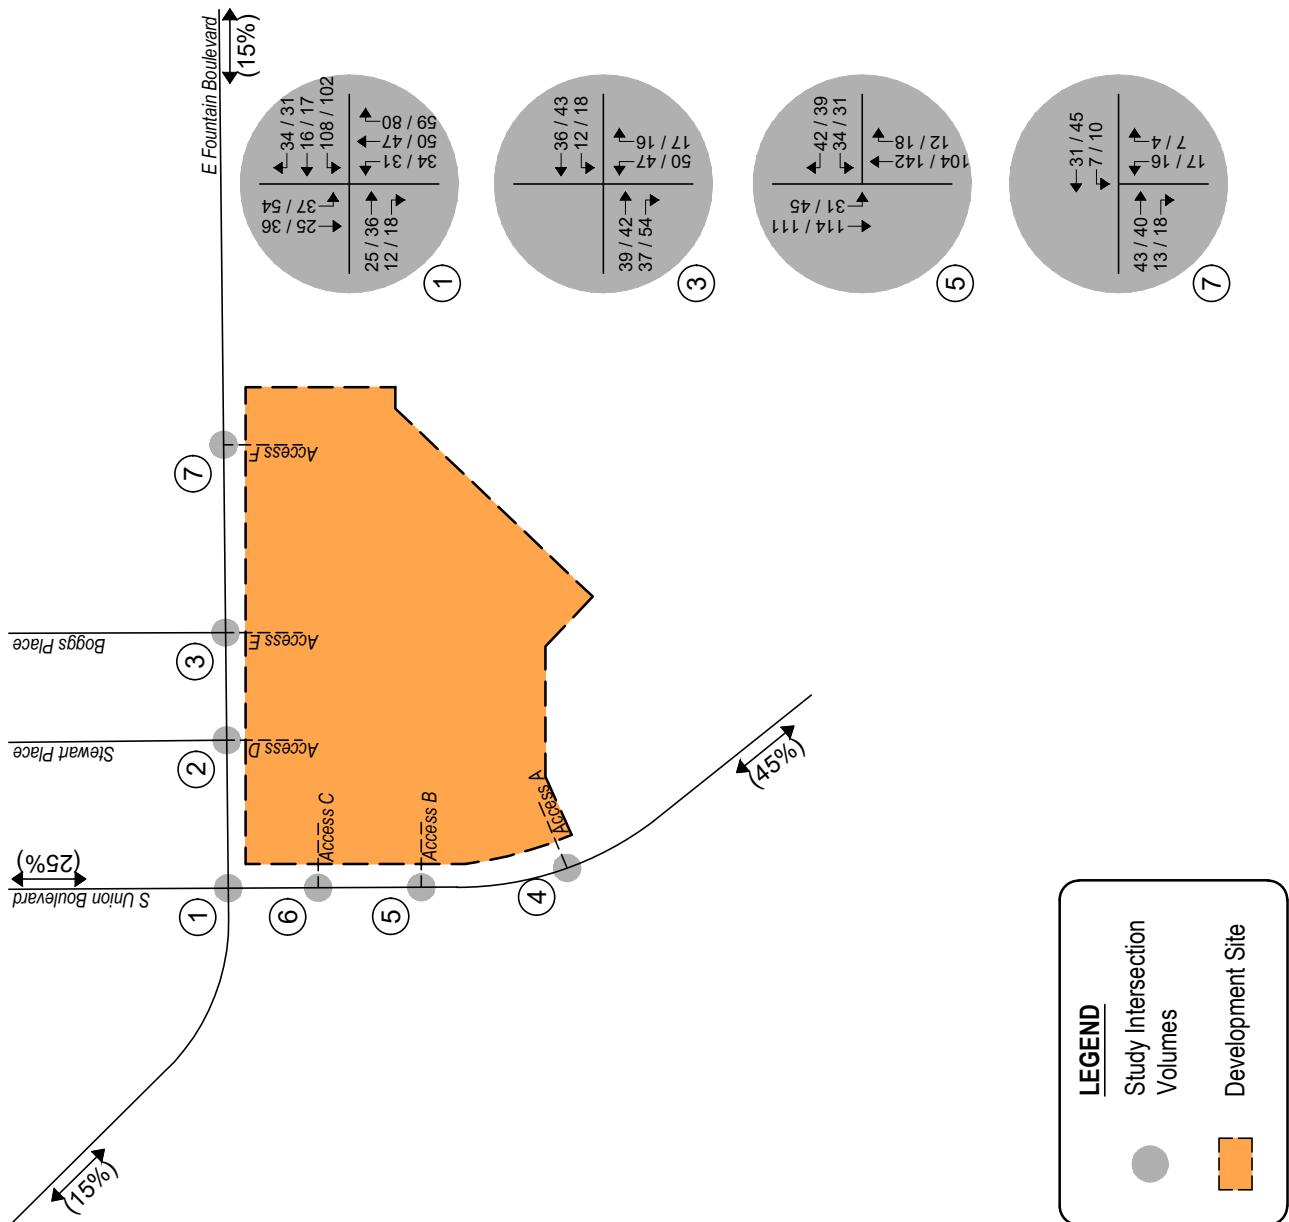

## **Trip Assignment**

Traffic assignment is how generated and distributed vehicle trips are expected to be loaded onto the available roadway network.

Applying trip distribution patterns to site-generated traffic provides the overall site-generated trip assignments shown on Figure 6.

Not to Scale

**Figure 6**  
**SITE DEVELOPMENT DISTRIBUTION (%)**: Overall  
**SITE-GENERATED**  
AM / PM Peak Hour

## **V. Future Traffic Conditions With Proposed Developments**

Site-generated traffic was added to background traffic projections for Years 2022 and 2040 to develop total traffic projections. For analysis purposes, it was assumed that development construction would be completed by end of Year 2022.

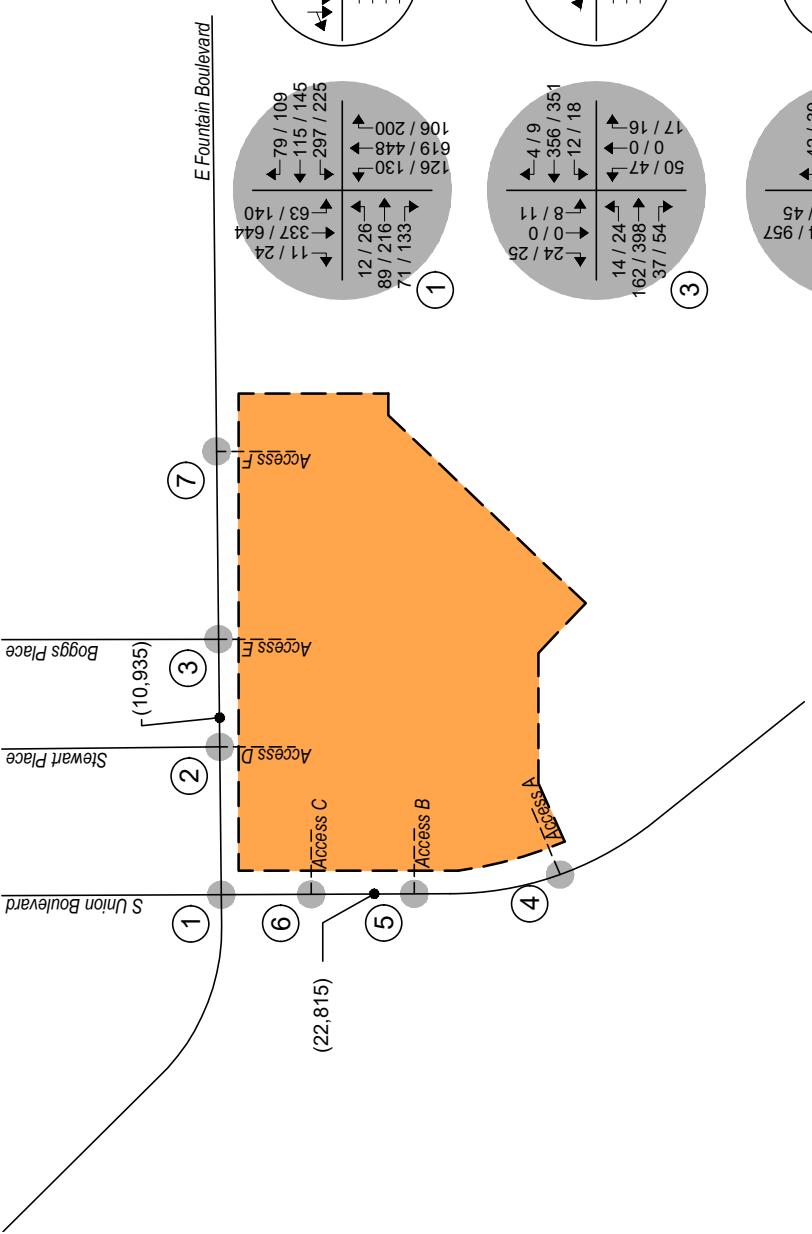

Pursuant to area roadway improvement discussions provided in Section III, Year 2022 and Year 2040 total traffic conditions assume no roadway improvements to accommodate regional transportation demands. Roadway improvements associated with site development are expected to be limited to site access and frontage as required by the governing agency.

Projected Year 2022 total traffic volumes and intersection geometry are shown in Figure 7.

Figure 8 shows projected total traffic volumes and intersection geometry for Year 2040.

## **VI. Project Impacts**

The analyses and procedures described in this study were performed in accordance with the Highway Capacity Manual (HCM) and are based upon the worst-case conditions that occur during a typical weekday upon build-out of site development and analyzed land uses. Therefore, study intersections are likely to operate with traffic conditions better than those described within this study, which represent the peak hours of weekday operations only.

### **Peak Hour Intersection Levels of Service**

As with background traffic, the operations of the study intersections were analyzed under projected total traffic conditions using the SYNCHRO computer program. Total traffic level of service analysis results for Years 2022 and 2040 are summarized in Table 6 and Table 7, respectively.

Definitions of levels of service are given in Appendix B. Intersection capacity worksheets are provided in Appendix C.

### Total Traffic Analysis Results Upon Development Build-Out

Table 7 illustrates how, by Year 2040 and upon development build-out, the signalized intersection of E Fountain Boulevard with S Union Boulevard shows an overall LOS C operation during both the morning and afternoon peak traffic hours. Compared to the background traffic analysis, the traffic generated by the proposed development is not expected to significantly change the operations of the study intersection.

The stop-controlled intersection of E Fountain Boulevard with Stewart Place/Access D is projected to have turning movement operations at LOS C or better for both the morning and afternoon peak traffic hours.

The stop-controlled intersection of E Fountain Boulevard with Boggs Place/Access E is projected to have turning movement operations at LOS B or better for the morning peak traffic hour and LOS C or better for the afternoon peak traffic hour.

The stop-controlled intersection of S Union Boulevard with Access A is projected to have turning movement operations at LOS C for both the morning and afternoon peak traffic hours.

The stop-controlled intersection of S Union Boulevard with Access B is projected to have turning movement operations at LOS C for the morning peak traffic hour and LOS D or better for the afternoon peak traffic hour.

The stop-controlled intersection of S Union Boulevard with Access C is projected to have turning movement operations at LOS A for both the morning and afternoon peak traffic hours.

The stop-controlled intersection of E Fountain Boulevard with Access F is projected to have turning movement operations at LOS B or better for both the morning and afternoon peak traffic hours.

These intersection operations are similar to background conditions.

### Auxiliary Lane Analysis

Auxiliary lanes for site development accesses are to be based on City's design standards<sup>5</sup>.

Considering development build-out, an evaluation of auxiliary lane requirements, pursuant to Section 8.0, Tables 2 and 3 of the City's design standards, reveals that left turn deceleration lanes are required for all full-movement site development accesses given the roadway classifications of E Fountain Boulevard and S Union Boulevard, as well as posted speed limit. It is however noted that an existing Two-Way-Left-Turn Lane (TWLTL) along E Fountain Boulevard can accommodate left turn needs for site development traffic. Left turn lanes along S Union Boulevard may be accommodated within an existing striped median. As specific land uses are further defined for the proposed development area, specific turn lane geometry and design is to be determined based on City design standards.

---

<sup>5</sup> Engineering Criteria Manual, Section III: Traffic Criteria Manual, City of Colorado Springs City Engineering, July 2010.

## VII. Conclusion

This traffic impact study addressed the capacity, geometric, and control requirements associated with the development entitled Prospect Park at Fountain & Union. This proposed mixed-use development consists of a variety of land uses including commercial and residential. The development is located on the southeast corner of E Fountain Boulevard and S Union Boulevard in Colorado Springs, Colorado.

The study area examined in this analysis encompassed the E Fountain Boulevard intersections with S Union Boulevard, Stewart Place, and Boggs Place, and also includes all proposed site access intersections.

Analysis was conducted for critical AM Peak Hour and PM Peak Hour traffic operations for existing traffic conditions, Year 2022 and Year 2040 background traffic conditions, and Year 2022 and Year 2040 total traffic conditions.

Under existing conditions, operational analysis shows that the signalized intersection of E Fountain Boulevard with S Union Boulevard has overall operations at LOS C during both morning and afternoon peak traffic hours. The unsignalized intersection of E Fountain Boulevard with Stewart Place has turn movement operations at LOS A during both morning and afternoon peak traffic hours. The unsignalized intersection of E Fountain Boulevard with Boggs Place has turn movement operations at LOS A during morning peak traffic hours and LOS B or better during afternoon peak traffic hours.

Year 2022 background traffic analysis indicates that the signalized intersection of E Fountain Boulevard with S Union Boulevard has overall operations at LOS C during both the morning and afternoon peak traffic hours. The unsignalized intersection of E Fountain Boulevard with Stewart Place shows turn movement operations at LOS A during both morning and afternoon peak traffic hours. The unsignalized intersection of E Fountain Boulevard with Boggs Place has turn movement operations at LOS B or better during both morning and afternoon peak traffic hours.

By Year 2040 and without the proposed development, the study intersection of E Fountain Boulevard with S Union Boulevard continues to experience LOS C operations during both morning and afternoon peak traffic hours. The stop-controlled intersection of E Fountain Boulevard with Stewart Place anticipates turn movement operations at LOS A or better during both morning and afternoon peak traffic hours. The stop-controlled intersection of E Fountain Boulevard with Boggs Place projects turn movement operations at LOS B or better during both morning and afternoon peak traffic hours.

Analysis of future traffic conditions indicates that the addition of site-generated traffic is expected to create no negative impact to traffic operations for the existing and surrounding roadway system upon consideration of the roadway and intersection control improvements assumed within this analysis. With all conservative assumptions defined in this analysis, the study intersections are projected to operate at future levels of service comparable to Year 2040 background traffic conditions. Proposed site accesses have long-term operations at LOS D or better during peak traffic periods and upon build-out.

**APPENDIX B**

**Level of Service Definitions**

The following information can be found in the [Highway Capacity Manual](#), Transportation Research Board, 2010:  
Chapter 18 – Signalized Intersections and Chapter 19 – Two-Way Stop Controlled Intersections.

### **Automobile Level of Service (LOS) for Signalized Intersections**

Levels of service are defined to represent reasonable ranges in control delay.

#### **LOS A**

Describes operations with a control delay of 10s/veh or less and a volume-to-capacity ratio no greater than 1.0. This level is typically assigned when the volume-to-capacity ratio is low and either progression is exceptionally favorable or the cycle length is very short. If it is due to favorable progression, most vehicles arrive during the green indication and travel through the intersection without stopping.

#### **LOS B**

Describes operations with control delay between 10 and 20 s/veh and a volume-to-capacity ratio no greater than 1.0. This level is typically assigned when the volume-to-capacity ratio is low and either progression is highly favorable or the cycle length is short. More vehicles stop than with LOS A.

#### **LOS C**

Describes operations with control delay between 20 and 35 s/veh and a volume-to-capacity ratio no greater than 1.0. This level is typically assigned when progression is favorable or the cycle length is moderate. Individual *cycle failures* (i.e., one or more queued vehicles are not able to depart as a result of insufficient capacity during the cycle) may begin to appear at this level. The number of vehicles stopping is significant, although many vehicles still pass through the intersection without stopping.

#### **LOS D**

Describes operations with control delay between 35 and 55 s/veh and a volume-to-capacity ratio no greater than 1.0. This level is typically assigned when the volume-to-capacity ratio is high and either progression is ineffective or the cycle length is long. Many vehicles stop and individual cycle failures are noticeable.

#### **LOS E**

Describes operations with control delay between 55 and 80 s/veh and a volume-to-capacity ratio no greater than 1.0. This level is typically assigned when the volume-to-capacity ratio is high, progression is unfavorable, and the cycle length is long. Individual cycle failures are frequent.

#### **LOS F**

Describes operations with control delay exceeding 80 s/veh or a volume-to-capacity ratio greater than 1.0. This level is typically assigned when the volume-to-capacity ratio is very high, progression is very poor, and the cycle length is long. Most cycles fail to clear the queue.

### **Level of Service (LOS) for Unsignalized TWSC Intersections**

Level of Service	Average Control Delay (s/veh)
A	0 - 10
B	> 10 - 15
C	> 15 - 25
D	> 25 - 35
E	> 35 - 50
F	> 50

Intersection Summary

Cycle Length: 114

Actuated Cycle Length: 114

Offset: 42 (37%), Referenced to phase 2:NBTL and 6:SBTL, Start of Green

Natural Cycle: 70

Control Type: Actuated-Coordinated

## Timings

### 1: S Union Boulevard & E Fountain Boulevard

## Total Traffic Volumes

AM Peak Hour - Year 2022

Maximum v/c Ratio: 1.21

Intersection Signal Delay: 37.9

Intersection LOS: D

Intersection Capacity Utilization 69.7%

ICU Level of Service C

Analysis Period (min) 15

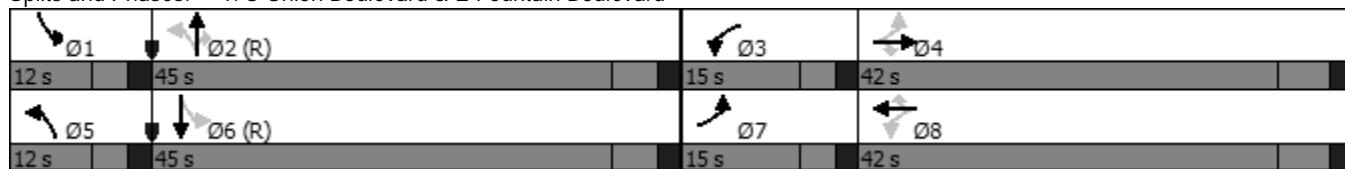

- Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

# 95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Splits and Phases: 1: S Union Boulevard & E Fountain Boulevard

## HCM 6th TWSC 2: Access D/Stewart Place & E Fountain Boulevard

Intersection Summary

Cycle Length: 114

Actuated Cycle Length: 114

Offset: 42 (37%), Referenced to phase 2:NBTL and 6:SBTL, Start of Green

Natural Cycle: 70

Control Type: Actuated-Coordinated

## Timings

### 1: S Union Boulevard & E Fountain Boulevard

## Total Traffic Volumes

PM Peak Hour - Year 2022

Maximum v/c Ratio: 0.88

Intersection Signal Delay: 24.2

Intersection LOS: C

Intersection Capacity Utilization 69.9%

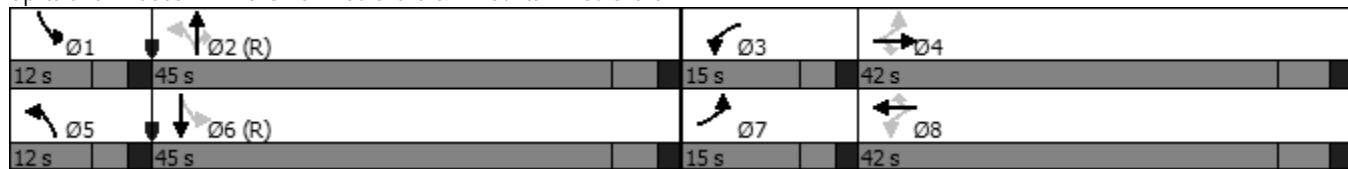

ICU Level of Service C

Analysis Period (min) 15

# 95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Splits and Phases: 1: S Union Boulevard & E Fountain Boulevard

HCM 6th TWSC  
2: Access D/Stewart Place & E Fountain Boulevard
