## Kimley»Horn

## Traffic Engineer's Statement

The attached traffic report and supporting information were prepared under my responsible charge and they comport with the standard of care. So far as is consistent with the standard of care, said report was prepared in general conformance with the criteria established by the County for traffic reports.

Curtis D. Rowe, P.E., PTOE, PE \#36355

May 1, 2020

Mr. Mark Phelan<br>KESS Properties, LLC<br>4955 Austin Bluffs Parkway<br>Colorado Springs, CO 80918<br>Re: The Shire at Old Ranch<br>Traffic Study Deviation Letter<br>El Paso County, Colorado

Dear Mr. Phelan:
This traffic study letter has been prepared for The Shire at Old Ranch proposed nursery to be located on the northeast corner of the Old Ranch Road and Howells Road intersection in El Paso County, Colorado. A vicinity map illustrating the location of the proposed development is attached as Figure 1.

Specifically, this letter has been prepared to provide a deviation request to allow access to the project along Howells Road as directed by El Paso County staff per the El Paso County Engineering Criteria Manual (El Paso ECM), 2016. A deviation is believed to be needed due to County standards identifying that access can only be granted from a lesser category street. Ridgeway Lane to the north is a local roadway whereas Howells Road to the west is a collector roadway. It is understood that a deviation is a critical aspect of the review process and needs to be documented to ensure that the deviations granted are applied to a specific development application in conformance with the criteria for approval. It is our hope that this study provides the County the needed information to grant this deviation request.

The project is bound by single family residences in all directions with rural ranch style homes located to the north and the east while typical urban style single family communities are located to the south and the west. Pine Creek High School is located in the extended area further to the west. The site area is shown within an aerial of attached Figure 2. A conceptual site plan for the proposed development is also attached.

This traffic study identifies the amount of project traffic associated with this proposed development and the resultant trip distribution and traffic assignment on the adjacent streets and public roadway intersections. An operational analysis was performed for the intersections of Ridgeway Lane/Howells Road and Old Ranch Road/Howells Road. In addition, the proposed full movement project access proposed to be located along Howells Road was included for evaluation. Analysis was performed for the 2020 short term development horizon as well as the 2040 long-term twenty-year horizon.

## Existing Roadway Network and Traffic Counts

Regional access will be provided by State Highway 21 (SH-21) while primary access will be provided by Old Ranch Road. Direct access to the project is proposed from one full movement access along Howells Road.

Old Ranch Road is a collector street providing one through lane in each direction, eastbound and westbound, with a 45 mile per hour speed limit east of Howells Road and a 35 mile per speed limit west of Howells Road. Howells Road is an unpaved collector street while Ridgeway Lane is an unpaved local street.

The existing T-intersection of Ridgeway Lane and Howells Road is stop controlled in the westbound Ridgeway Lane approach direction. Lane configurations are not defined at this intersection due to both roadways being unpaved. However, this intersection was analyzed with single shared movements lanes on all three approaches.

The T-intersection of Old Ranch Road and Howells Roads is unsignalized with stop control along the southbound Howells Road approach. The eastbound approach of this intersection provides a left turn lane within an existing two-way left turn lane and one through lane. The westbound approach provides one through lane and a right turn lane currently not built to County standards. The southbound approach has a paved section for approximately 50 feet before transitioning to an unpaved roadway. This southbound approach provides a single shared lane to serve all movements. An existing intersection lane configuration and control figure is attached as Figure 3.

Existing weekday afternoon peak hour and Saturday midday peak hour of the generator turning movement counts were conducted at the study key intersections, Ridgeway Lane/Howells Road and Old Ranch Road/Howells Road, on Thursday, March 21, 2019 and on Saturday, March 30, 2019. The weekday counts were conducted in 15-minute intervals during the afternoon peak hours of adjacent street traffic from 4:00 PM to 6:00 PM. Likewise, the Saturday counts were conducted in 15-minute intervals during the peak hour of the generator traffic from 12:00 PM to 2:00 PM. Existing turning movement counts are shown in attached Figure 4 with count sheets attached as well.

## Unspecified Development Traffic Growth

In order to obtain traffic volumes for the future build out and twenty-year study horizons, future traffic volume projections were obtained from surrounding area traffic information, including from traffic projections from the El Paso County Major Transportation Corridor Plan (El Paso MTCP) and from Colorado Department of Transportation (CDOT) traffic information. According to information provided on the CDOT Online Transportation Information System (OTIS) website, the 20-year growth factor along Powers Boulevard (SH21), south of Old Ranch Boulevard in the vicinity of the project, is 1.56 , which equates to an annual growth rate of approximately 2.25 percent.

Additional information provided by the El Paso MTCP was used to determine annual traffic volume growth rates along Burgess Road, Shoup Road, and Black Forest Road. The annual growth rate for Burgess Road, east of Milam Road, was determined to be 1.81 percent while the annual growth rate for Shoup Road, west of Milam Road, was found to be 3.56 percent. Further, the annual growth rate for Black Forest Road, north of Burgess Road, was found to
be 3.88 percent. An overview of both the El Paso MTCP and CDOT traffic growth information for the study area are attached with this letter.

Both El Paso MTCP and CDOT traffic projection estimates were used to calculate an overall average annual growth rate of 2.87 percent. Based on this, an annual growth projection of three percent (3\%) was used to calculate future traffic volumes within the project study area. It should be noted that Milam Road will extend south of South of Old Ranch Road and will connect with Union Boulevard/Grand Cordera Parkway to the south. This extension of Milam Road is expected to be constructed and open soon. The extension of Milam Road will likely reduce the traffic volumes along Old Ranch Road; however, traffic volumes were not reduced along Old Ranch Road to provide a conservative analysis. The 3 percent annual growth rate was used to estimate near term 2020 and long term 2040 traffic volume projections at the key intersections. Background traffic volumes for 2020 and 2040 are shown in attached Figures 5 and 6, respectively.

## Trip Generation

Site-generated traffic estimates are determined through a process known as trip generation. Rates and equations are applied to the proposed land use to estimate traffic generated by the development during a specific time interval. The acknowledged source for trip generation is the Trip Generation Manual ${ }^{1}$ published by the Institute of Transportation Engineers (ITE). ITE has established trip rates in nationwide studies of similar land uses.

Project generated traffic volumes are identified on a weekday daily as well as on an afternoon peak hour of the adjacent street and Saturday peak hour of the generator basis. The afternoon peak hour is the highest one-hour time period of adjacent street traffic during four consecutive 15-minute intervals between the hours of 4:00 pm and 6:00 pm. The Saturday peak hour is the highest one-hour time period of site traffic during four consecutive 15-minute intervals between the hours of 12:00 pm and 2:00 pm.

For this study, ITE Trip Generation average rate equations that apply to Hotel (ITE Code 310), Campground (ITE 416), Office (ITE 710), Nursery Garden Center (ITE 817), Nursery Wholesale (ITE 818), Arts and Craft (ITE 879), and Sit-Down Restaurant (ITE 932) were used for traffic associated with the proposed development. The restaurant use is expected to capture trips within the site and was accounted for in calculations for total external trips for the project. The following Table 1 summarizes the anticipated trip generation for the proposed project with the trip generation calculations worksheet attached.

The site is expected to contain six (6) guest housing yurt sites and four (4) campsites which categorized as hotel and campground. A metal shop, wood shop, and ceramics shop are proposed which were categorized as arts and crafts. These three shops are conduct classes. A café is also proposed on the property which was evaluated under sit-down restaurant. The proposed equipment barn and animal barn will not be for the public and is not expected to generate traffic. It is possible for the facility to host special events, but these will not occur frequently and are not expected to be planned during the peak hours of travel.

[^0]Table 1 - The Shire at Old Ranch Project Traffic Generation

| Land Use | Quantity | Units | Vehicle Trips |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | Weekday Daily | Weekday PM Peak Hour |  |  | Saturday Peak Hour of Generator |  |  |
|  |  |  |  | In | Out | Total | In | Out | Total |
| Total Site Generated Trips |  |  |  |  |  |  |  |  |  |
| Hotel (ITE 310) | 6 | Rooms | 50 | 2 | 2 | 4 | 2 | 2 | 4 |
| Campground (ITE 416) | 4 | Campsites | 20 | 1 | 0 | 1 | *1 | *0 | *1 |
| Office (ITE 710) | 5,300 | Square Feet | 52 | 1 | 5 | 6 | 2 | 1 | 3 |
| Nursery - Garden Center (ITE 817) | 25,300 | Square Feet | 1,724 | 88 | 88 | 176 | 254 | 254 | 508 |
| Nursery - Wholesale (ITE 818) | 4,500 | Square Feet | 176 | 12 | 11 | 23 | 11 | 14 | 25 |
| Arts and Craft Store (ITE 879) | 3,000 | Square Feet | 170 | 9 | 10 | 19 | *9 | *10 | *19 |
| Sit-Down Restaurant (ITE 932) | 2,500 | Square Feet | 282 | 15 | 9 | 24 | 14 | 14 | 28 |
| Total Site Generated Trips |  |  | 2,474 | 128 | 125 | 253 | 283 | 285 | 568 |
| Internal Capture Trips |  |  |  |  |  |  |  |  |  |
| Sit-Down Restaurant (ITE 932) | 2,500 | Square Feet | 141 | 8 | 5 | 12 | 7 | 7 | 14 |
| Total External Trips after Internal Capture |  |  | 2,333 | 121 | 121 | 241 | 276 | 278 | 554 |

* = Includes Weekday PM Peak Hour due to Saturday Peak Hour of Generator Data not provided by ITE

As summarized in the table above, The Shire at Old Ranch project is anticipated to generate approximately 2,333 daily external weekday trips with 241 of these trips occurring during the afternoon peak hour. Further, 554 external project trips are expected to be generated during the peak hour on a Saturday.

## Distribution, Assignment, and Total Traffic

Distribution of site traffic was based on the area street system characteristics, existing traffic patterns and volumes, and the proposed access system for the project. The distribution of traffic is a means to quantify the percentage of site-generated traffic that approaches the site from a given direction and departs the site back to the original source. Project traffic originating from either direction can access the site. Two separate trip distributions were developed for the project due to the deviation request for allowing a full movement access along Howells Road. Project trip distribution Scenario 1 includes providing access along Howells Road while Scenario 2 includes access only along Ridgeway Lane to meet current County standards. Attached Figure 7 illustrates the expected trip distribution under Scenario 1 for the proposed project, while Figure 8 provides the trip distribution for Scenario 2.

Traffic assignment was obtained by applying the project trip distribution to the estimated project traffic generation of the development shown in the trip generation table. The traffic assignment for project traffic Scenario 1 is shown in Figure 9 while project traffic for Scenario 2 is shown in Figure 10. Site traffic volumes were added to the 2020 and 2040 background volumes to represent estimated build-out year and long-term traffic conditions. These total traffic volumes for 2020 are illustrated in Figure 11 for Scenario 1 and Figure 12 for Scenario 2. Likewise, the 2040 total traffic volumes are shown in Figure 13 for Scenario 1 and Figure 14 for Scenario 2.

## Traffic Operations Analysis

Kimley-Horn's analysis of traffic operations in the site vicinity was conducted to determine potential capacity deficiencies at the project key intersections for the 2020 buildout and 2040 long term horizons. The acknowledged source for determining overall capacity is the Highway Capacity Manual.

Capacity analysis results are listed in terms of Level of Service (LOS). LOS is a qualitative term describing operating conditions a driver will experience while traveling on a particular street or highway during a specific time interval. It ranges from A (very little delay) to F (long delays and congestion). For intersections and roadways in this study area, typical traffic study practice identifies overall intersection LOS D and movements or approaches LOS E as the minimum thresholds for acceptable operations. The following Table 2 shows the definition of level of service for signalized and unsignalized intersections. Intersection level of service capacity analysis outputs are attached.

Table 2 - Level of Service Definitions

| Level of <br> Service | Signalized Intersection <br> Average Total Delay <br> (sec/veh) | Unsignalized Intersection <br> Average Total Delay <br> (sec/veh) |
| :---: | :---: | :---: |
| A | $\leq 10$ | $\leq 10$ |
| B | $>10$ and $\leq 20$ | $>10$ and $\leq 15$ |
| C | $>20$ and $\leq 35$ | $>15$ and $\leq 25$ |
| D | $>35$ and $\leq 55$ | $>25$ and $\leq 35$ |
| E | $>55$ and $\leq 80$ | $>35$ and $\leq 50$ |
| F | $>80$ | $>50$ |

Definitions provided from the Highway Capacity Manual, Sixth Edition, Transportation Research Board, 2016.

## Ridgeway Lane and Howells Road

The existing T-intersection of Ridgeway Lane and Howells Road operates with stop control on the westbound Ridgeway Lane approach. All movements at this intersection currently operate acceptably with LOS A during the morning and afternoon peak hours. With addition of project traffic and accesses allowed along Howells Road (Scenario 1), all movements at this intersection are expected to continue to operate acceptably with LOS A during the peak hours throughout the 2040 horizon. With an access only located along Ridgeway Lane (Scenario 2), all movements at this intersection are expected to operate acceptably during the peak hours in 2020 and 2040, however the westbound approach degrades to a LOS C. Table 3 provides the results of the level of service analysis for this intersection.

Table 3 - Ridgeway Lane and Howells Road LOS Results

| Scenario | PM Peak Hour |  | Saturday Peak |  |
| :---: | :---: | :---: | :---: | :---: |
|  | $\begin{gathered} \text { Delay } \\ \text { (sec/veh) } \end{gathered}$ | LOS | $\begin{gathered} \text { Delay } \\ \text { (sec/veh) } \end{gathered}$ | LOS |

Scenario 1: Includes full movement access along Howells Road
Scenario 2: Includes one access along Ridgeway Lane only

## Kimley»Horn

## Old Ranch Road and Howells Road

The existing T-intersection of Old Ranch Road and Howells Road operates with stop control on the southbound Howells Road approach. All movements at this intersection currently operate acceptably with LOS B or better during the morning and afternoon peak hours. With addition of project traffic, all movements at this intersection are expected to continue to operate acceptably with LOS C or better during the peak hours in 2022. In 2040 with the addition of project traffic and separate southbound left turn and right turn lanes, the southbound left turn may operate with a LOS E if future traffic projections are realized. However, 35 seconds is the threshold from going from D to E , so the southbound left turn is just 0.2 seconds of delay per vehicle during the morning peak hour and 0.1 seconds of delay per vehicle during the afternoon peak hour from operating at LOS D. The southbound approach is anticipated to operate at LOS B during the morning peak hour and LOS C during the afternoon peak hour. Of note, whether access is provided along Howells Road or Ridgeway Lane for this project, the traffic volumes will be the same through this intersection for both access scenarios. Table 4 provides the results of the level of service analysis for this intersection.

Table 4 - Old Ranch Road and Howells Road LOS Results

|  | PM Peak Hour |  | Saturday Peak |  |
| :--- | :---: | :---: | :---: | :---: |

Scenario 1: Includes full movement access along Howells Road
Scenario 2: Includes one access along Ridgeway Lane only

## Kimley»Horn

## Project Access Operational Analysis

With completion of The Shire at Old Ranch development, the site proposes one access location, a full movement access along the east side of Howells Road. This access should be stop controlled with the installation of a R1-1 "STOP" sign on the exiting access approaches and a 115 -foot northbound right turn lane constructed. The lane configuration and control recommendations are shown in Figure 15. With the Scenario 1 recommended lane configurations, all movements at the access along Howells Road are expected to operate acceptably with LOS B or better during the peak hours throughout the 2040 horizon.

A scenario with one full movement access along the south side of Ridgeway Lane was also evaluated due to El Paso County guidelines of not allowing access along major collectors. An access analysis is discussed and evaluated later in this study to allow access along Howells Road per a deviation request. With access only allowed along Ridgeway Lane, all movements at the Ridgeway Lane access are expected to operate with LOS B or better during the peak hours in 2020 and 2040.

The operational analysis at the proposed project driveways is summarized in Table 5 for the short-term 2020 horizon and for the long-term 2040 horizon. Detailed results of the operational analysis are also attached.

Table 5 - Project Access LOS Results

Scenario 1: Access along Howells Road Only

| Howells Road Access (Scenario 1) | 9.5 | A | 10.7 | B | 9.9 | A | 11.1 | B |

| Southbound Left |  |  |  |  |  |  |  |  |

Scenario 2: One Access along Ridgeway Lane Only

| Ridgeway Lane Access (Scenario 2) <br> Northbound Approach | 9.1 | A | 10.1 | B | 9.1 | A | 10.3 | B |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

## Deviation Request Access Analysis

A deviation to allow access along Howells Road as directed by El Paso County staff is evaluated in this section per the El Paso ECM. A deviation is a critical aspect of the review process and needs to be documented to ensure that the deviations granted are applied to a specific development application in conformance with the criteria for approval.

Table 2-5 from the El Paso ECM indicates that access along major collectors is not permitted if access from a lower category street is available. According to the EI Paso ECM, accesses may be permitted as a deviation if they meet the criteria for sight distances and grades, turn lane requirements, and do not negatively impact traffic operations or safety.

## Kimley»)Horn

The addition of such accesses also shall minimize impacts to queuing or blocking of lane entries or access points and minimize impacts to progression.

## Sight Distances

It is recommended that sight triangles be provided at all site access points to give drivers exiting the site a clear view of oncoming traffic. Landscaping and objects within sight triangles must not obstruct drivers' views of the adjacent travel lanes. ECM design intersection sight distances for left turn from stop and right turn from stop were evaluated at the Howells Road access.

According to Table 2-36 from ECM and with a speed limit of 25 miles per hour along Howells Road, the intersection entering sight distance for a passenger car is 250 feet. The project site is expected to have minimal truck trips; however, sight distances were evaluated for both passenger cars and single unit trucks. Table 2-36: Entering Sight Distance (Access Design) from ECM was used for entering vehicles. With a speed limit of 25 miles per hour and a two-lane roadway along Howells Road, the entering sight distance is 325 feet for single unit trucks. All obstructions for left turn vehicles from stop at the Howells Road access should be clear to the left and right within a triangle created from the vertex point 10 feet from the traveled way edge and a line of sight distance of 325 feet located in the middle of the approaching through lane along Howells Road. The passenger car distance (yellow) and single unit truck (blue) distances are shown in following aerial.

## Kimley»Horn

As shown, the 325 -foot sight distance requirement from the proposed Howells Road access will be to the north edge of the Old Ranch Road intersection to the south and to the existing residence access to the north. These distances were evaluated. The proposed access is located on the crest of a vertical curve along Howells Road. This provides an optimal location of the access intersection with acceptable sight distance to the north and south. Further, Howells Road is straight through this section without any horizontal curvature. A graphic is attached that provides photographs of the access and the associated sight distance available. Through this analysis, it is believed that adequate sight distance will be available for the Howells Road access intersection. This will be considered when the Howell Road improvements are designed.

## Auxiliary Turn Lane Warrants and Length Criteria

A left turn lane is required with a projected peak hour ingress turning volume of 25 vehicles per hour (vph) or greater for any access along a minor arterial or lower classification roadway per the El Paso ECM. A right turn lane is required with a projected peak hour ingress turning volume of 50 vph or greater for any access along a minor arterial or lower classification roadway. An acceleration lane is generally not required. These thresholds were applied to the Old Ranch Road/Howells Road and Howells Road Access as follows:

## Old Ranch Road/Howells Road

An eastbound left turn lane is warranted and exists today. This left turn lane is currently designated with two-way left turn lane striping for approximately 230 feet to the roundabout splitter island on the east leg. Based on a $30-\mathrm{mph}$ design speed on this uncontrolled approach, the left turn lane length would include 50 feet for storage, 115 feet for deceleration, and a 120 -foot taper. Therefore, it is recommended that this distance be striped with a left turn lane for 165 feet plus a 90 -foot taper back to the splitter island crosswalk location. This is the maximum length available for this left turn lane.

Likewise, a southbound right turn lane is warranted at this intersection. This southbound right turn lane will be constructed as part of the paving improvements of Howells Road proposed as part of this project. Per El Paso County standards, the southbound right turn lane should include storage, plus deceleration of 115 feet and taper of 120 feet with a design speed of 30 mph . This is a stop-controlled approach, so the storage length is defined by the traffic volume instead of by actual queue length calculations. The southbound right turn volume is anticipated to be 255 vehicles per hour with project development, which indicates that this southbound right turn lane needs to provide a length of 250 feet plus 115 feet for deceleration plus a 120 -foot taper. Therefore, this southbound right turn lane needs to provide a length of 365 feet plus a 120 -foot taper to meet standards.

## Howells Road Access

A northbound right turn lane will be required at the project access along Howells Road based on a projected 262 vph right turn movements during the Saturday peak hour with a threshold of 50 vph . The northbound right turn lane at the access along Howells Road should provide a right turn lane to include storage length plus 115 feet for deceleration plus a 120 -foot taper per Table $2-25$ of the El Paso ECM with a roadway that has a $30-\mathrm{mph}$ design speed. This is an uncontrolled approach that shows a storage length of less than 1 vehicle. Therefore, 50 feet of storage is applied, which identifies that the northbound right turn lane should be constructed with a length of 165 feet plus 120-foot taper.

## Kimley»"Horn

## Intersection Operations, Vehicle Queuing and Progression

As indicated in the Traffic Operations Analysis section, the intersection of Old Ranch Road/Howells Road is expected to operate with the same LOS when access is proposed along Howells Road compared to only allowing access along Ridgeway Lane. However, movements at the intersection of Ridgeway Lane/Howells Road are expected to operate with better LOS and lower vehicle delays with the Howells Road access scenario (Scenario 1). Additionally, all movements at the project access along Howells Road are expected to operate acceptably with LOS B or better during the peak hours throughout the 2040 horizon.

A vehicle queuing analysis was performed for the study area intersections in 2020 and 2040 under both Scenario 1 and Scenario 2 access options. Vehicle queuing calculations are attached within the level of service operational sheets. Results of the queuing analysis and recommendations at the study area intersections are provided in Table 6.

Table 6 - Vehicle Queuing Analysis Results

| Intersection Turn Lane | $\begin{aligned} & \hline \text { Scenario } 1 \\ & 2020 \\ & \text { Calculated } \\ & \text { Queue } \\ & \text { Length } \\ & \text { (vehicles) } \\ & \hline \end{aligned}$ | $\begin{aligned} & \hline \hline \text { Scenario 2 } \\ & 2020 \\ & \text { Calculated } \\ & \text { Queue } \\ & \text { Length } \\ & \text { (vehicles) } \\ & \hline \end{aligned}$ | $\begin{aligned} & \hline \hline \text { Scenario } 1 \\ & 2040 \\ & \text { Calculated } \\ & \text { Queue } \\ & \text { Length } \\ & \text { (vehicles) } \\ & \hline \end{aligned}$ | $\begin{array}{\|l} \hline \text { Scenario } 2 \\ 2040 \\ \text { Calculated } \\ \text { Queue } \\ \text { Length } \\ \text { (vehicles) } \\ \hline \end{array}$ |
| :---: | :---: | :---: | :---: | :---: |
| Ridgeway Ln \& Howells Rd Westbound Approach Southbound Left | $\begin{aligned} & 1 \\ & 1 \\ & \hline \end{aligned}$ | $\begin{aligned} & 4 \\ & 1 \\ & \hline \end{aligned}$ | $\begin{aligned} & 1 \\ & 1 \\ & \hline \end{aligned}$ | $\begin{aligned} & 4 \\ & 1 \\ & \hline \end{aligned}$ |
| Old Ranch Rd \& Howells Rd Eastbound Left Southbound Left Southbound Right | $\begin{aligned} & 1 \\ & 1 \\ & 2 \end{aligned}$ | $\begin{aligned} & 1 \\ & 1 \\ & 2 \end{aligned}$ | $\begin{aligned} & 1 \\ & 1 \\ & 3 \end{aligned}$ | $\begin{aligned} & 1 \\ & 1 \\ & 3 \\ & \hline \end{aligned}$ |

As documented in the LOS outputs (attached) and vehicle queuing table for the Ridgeway Lane and Howells Road intersection, all vehicle queues are expected to be one (1) vehicle for Scenario 1 with the Howells Road access. If access isn't provided along Howells Road and only access is allowed along Ridgeway Lane, then the westbound approach may be four (4) vehicles.

Progression of traffic will not be impacted at the proposed access location along Howells Road because this access intersection will not warrant or require signalization.

## Existing Residential Access Removals

The existing site consists of four (4) residences. The residence located in the southeast portion of the site, located at 3890 Old Ranch Road will remain as a residence with its access to remain unmodified along Old Ranch Road. The residence located in the southwest portion of the site, directly on the northeast corner of the Old Ranch Road and Howells Road intersection at 3820 Old Ranch Road will be converted to office space and the accesses to this property from both Old Ranch Road and Howells Road will be removed. The proposed access for The Shire at Old Ranch development will be located at the existing access just to the north of this existing residence being converted to office. The two

## Kimley»"Horn

residences located along Howells Road at 10655 Howells Road and 10755 Howells Road will remain as residences with their accesses to remain unmodified. However, there is an access between these two residences that will be removed. The following aerial shows the accesses to be removed (red X), the access to be improved as the proposed project access, and the residential accesses to remain (green check-mark). For the exhibit, the property is outlined in yellow. Ridgeway Lane is located along the north side of the property, Howells Road along the west side of the property, and Old Ranch Road along the south side of the property (north is up).

## Kimley»Horn

## Additional Deviation Request Factors

Access granted only along Ridgeway Lane will change the character of the local street. Ridgeway Lane is classified as a local street and local streets can typically support approximately 750 vehicles per day while maintaining the local character with residential driveways. Based on this project with access only provided along Ridgeway Lane (Scenario 2), weekday and weekend daily project traffic volumes are expected be approximately 2,400 and 3,400 vehicles per day, respectively. These vehicles would all have to be directed to Ridgeway Lane if access was only permitted on Ridgeway Lane. These volumes alone would exceed the 750 vehicles per day typical threshold along a local street. Traffic volumes are currently very low along Ridgeway Lane and homeowners along this local street will not desire all traffic from this project routed onto their street. Additionally, access only along Ridgeway Lane would increase vehicle miles traveled (VMT), travel time, vehicle emissions, and reduce air quality.

It is respectfully being requested that a full movement access along Howells Road be allowed. If granted, it is recommended that the access along Howells Road be located a minimum of 330 feet (measured center to center) north of Old Ranch Road based on the deviation request analysis. This spacing distance has been based on evaluation of minimum spacing, turn lane requirements, and sight distances.

## Recommendations and Conclusions

It is respectfully requested that access be allowed along Howells Road to serve The Shire at Old Ranch project. If granted, the following provides recommendations and conclusions based on this requested access condition:

- It is recommended that the access along Howells Road be located a minimum of 330 feet (measured center to center) north of Old Ranch Road based on the deviation request analysis.
- A northbound right turn lane should be provided at the access along Howells Road and be constructed with a lane length of 165 feet plus a 120 -foot taper. Of note, since clear zone is calculated from the edge of the through lane, adding a right turn lane at this access intersection isn't anticipated to impact the clear zone. Based on fence lines along Howells Road, it appears that the roadway right-of-way is 60 feet, which is sufficient for the three lane section proposed.
- The proposed project access along Howells Road should be stop controlled with the installation of R1-1 "STOP" sign on the exiting access approach.
- Howells Road should be paved from Old Ranch Road to the proposed Howells Road Access per ECM Section 2.2.7.B.2: Existing Roads.
- The southbound approach of Howells Road to Old Ranch Road is recommended to include a 365 -foot right turn lane with a 120 -foot taper.
- The existing 235 -foot long two-way left turn lane striping between the roundabout splitter island and Howells Road intersection along Old Ranch Road is recommended to be reconstructed and restriped to include a 165 -foot left turn lane with 90 -foot taper as available between the crosswalk on the east leg of the roundabout and Howells Road.

The recommended intersection lane configurations and control for the project intersections and access is illustrated in attached Figure 15.

## Kimley»>Horn

In summary, this traffic study letter provides a deviation request to allow a full movement access along Howells Road. Kimley-Horn believes The Shire at Old Ranch project will be successfully incorporated into the existing and future roadway network. We respectfully request that El Paso County consider approval of this deviation request to allow access along Howells Road. If you have any questions or require anything further, please feel free to call me at (303) 228-2304.

Sincerely,
KIMLEY-HORN AND ASSOCIATES, INC.

Curtis D. Rowe, P.E., PTOE Vice President

Figure 2-17. Typical Urban Local (low volume) Cross Section

### 2.2.5 Roadway Access Criteria

All new or modified accesses to the County roadways shall meet the requirements of the ECM. Standards and technical criteria not specifically addressed in the ECM shall follow the provisions of the AASHTO, A Policy on Geometric Design of Highways and Roadways ("Green Book") and the Colorado State Highway Access Code. In addition, should any access request fall within the preview of the Major Thoroughfare Task Force (MTTF), per their adopted bylaws, then the request shall be brought before the MTTF for a recommendation.

## A. Rural and Urban Expressway Access Criteria

## 1. Intersection Spacing and General Access Standards

Full movement intersections and major access spacing shall meet the requirements of this section. Right-in/right-out and three quarter movement accesses may be permitted as a deviation only if they meet the criteria presented in this section for sight distances, turn lane requirements, grades and do not negatively impact traffic operations or safety.
2. No Alternative Access to Road System

Where reasonable access can be obtained from the local roadway system, a temporary direct lot or partial turn movement access may be permitted provided the access meets these Standards or as otherwise required by the ECM Administrator.

## 3. Access and Lot Division

No additional access right shall accrue and no additional access shall be provided when splitting or dividing of existing lots of land. When an alternative is reasonably available in the opinion of the ECM Administrator, all access to the newly created properties shall be

[^1]provided internally from the existing access or new access to a roadway of lower functional classification.

## 4. Relocation of Access when Alternative is Available

All access to an expressway not meeting the minimum one-mile spacing requirement shall be closed in favor of an alternative access when an alternative is reasonably available in the opinion of the ECM Administrator.

## B. Rural and Urban Principal Arterial and Rural Minor Arterial Access Criteria

## 1. Spacing

Spacing of roads accessing a principal arterial or rural minor arterial that will result in a full movement intersection shall be planned at one-half mile (one-quarter mile for rural minor arterials). Should the one-half mile spacing not be "viable or practical" for providing access to the adjacent land, a deviation may be considered and approved by the ECM Administrator. If a deviation is granted, only one additional full movement intersection will be permitted by the ECM Administrator. The Applicant shall have the burden of proof that no other "viable or practical" access is available. A deviation request should be supported by a traffic study or memorandum that provides information to assist the ECM Administrator in determining the proposed deviation minimizes negative safety and other operational impacts. If the development is at the intersection of two major corridors, the full movement access should be located on the lower functional classification roadway. The intersection shall only be approved if the intersection and roadway are shown to operate safely and efficiently with buildout design hour/peak hour projected traffic volumes. The intersection must also show a public benefit. An arterial progression through bandwidth percentage of 35 percent or greater must be achieved or the inclusion of a signal at the access must not degrade the existing signal progression. The intersection must not create any queuing or blocking of lane entries or access points. The intersection must be in a location such that any necessary turn, acceleration and deceleration lanes can be accommodated to maintain safe operations and capacity. The analysis should consider all potential future additional requirements for left turn or other exclusive phasing at a signal for which the need is created by traffic generated by land uses on both sides of the roadway.

## 2. Topographic and Other Limitations

Where topography or other existing conditions make the required spacing inappropriate or unfeasible, location of the access shall be determined with consideration given to topography, established property ownerships, unique physical limitations, pre-existing historical land use patterns, and physical design constraints, with every attempt to achieve an access spacing of one-half mile. The final location shall serve as

[^2]many properties as possible to reduce the need for additional direct access to the principal arterial or rural minor arterial. In selecting locations for full movement intersections, preference shall be given to roads that meet, or may be reasonably expected to meet, signal warrants in the future.

## 3. Access and Lot Division

No additional access right shall accrue and no additional access shall be provided when splitting or dividing existing lots of land. When an alternative is reasonably available in the opinion of the ECM Administrator, all access to the newly created properties shall be provided internally from the existing access or new access to a roadway of lower functional classification.

## C. Urban Minor Arterial Access Criteria

Spacing of roads accessing an urban minor arterial that will result in a full movement intersection shall be planned at one-quarter mile. However, one parcel access shall be granted to each existing lot, if it does not create safety or operational problems. The parcel access will provide for right turns only. The access may allow for left turns in (three-quarters movement) if the addition of left turns will improve the operation at an adjacent full movement intersection and meet appropriate design standards.

## D. Collector Access Standards

Collector roadways shall intersect another roadway (centerline to centerline) in accordance with the standards in Section 2.3.7. On minor collector roadways, the closest local roadway intersection to an arterial roadway shall be 330 feet (right-of-way line of arterial to centerline of local roadway). On major collector roadways, the closest local roadway intersection to an arterial roadway shall be 660 feet (right-of-way line of arterial to centerline of local roadway). Single-family residence access to major collector roadways is not permitted (even though existing conditions show otherwise).

## E. Rural and Urban Local Roadways

Roads shall not intersect urban local roadways closer than 200 feet from each other (centerline to centerline) and shall not intersect a rural local roadway closer than 330 feet from each other. On an urban local roadway, the closest intersection to a collector roadway shall be at least 200 feet (centerline to centerline). To an arterial roadway, the closest intersection shall be 330 feet (arterial right-of-way line to local roadway centerline).

[^3]
### 2.2.7 Pavement Design

## A. General

Pavement design is a critical component of roadway design. Proper pavement design helps to ensure roadway performance and reduce the lifecycle costs associated with maintaining the roadway system.

## B. Road Paving Policy

Paved roads meet the paving requirements established by Roadway Functional Classifications in Section 2.2.4.

## 1. New Roads

New roadways shall be paved if it connects to an existing roadway that is paved at the time of final approval of the development or it connects to a roadway internal to the development that is required to be paved.

New roadways are not required to be paved where:

- The new roadway has a projected ADT of less the 200 ADT within the proposed 20 -year design life and the new road connects to an existing gravel road or
- The new road is located in an area of gravel roads and, to reduce the cost of maintenance, the ECM Administrator has determined that a gravel road is the most appropriate application.

## 2. Existing Roads

Existing roadways shall be paved where:

- Any development causes an existing gravel road to exceed a projected ADT of 200 (Note: the extent of paving will be determined by the ECM Administrator based on the Transportation Impact Study [Section 2.2.3]).
- In accordance with the terms and conditions of BOCC Resolution $99-55,100 \%$ of the residents agree to participate in a Resident Participation Program to pave a road in their neighborhood at their own expense.

## 3. New Gravel Roads

New gravel roads may be permitted in accordance with the allowances in Section 2.2.7B. 1 except where:

- The gravel road is projected to have an ADT of 200 or more. All roads with a projected ADT of 200 or more shall be paved to facilitate compliance with Colorado Air Quality Control Commission Regulation No. 1, Emission Control Regulations for Particulates, Smokes, and Sulfur Oxides for the State of Colorado.

Table 2-3. Roadway Design Criteria Continued

| Criteria | Concern | Guideline |
| :--- | :--- | :--- |
| Minimize <br> Space <br> Devoted to <br> Road Use | It is desirable to minimize local road <br> mileage, thereby reducing construction <br> and maintenance costs, as well as <br> permitting the most efficient use of land. <br> Roads should also have an appearance <br> commensurate with their function. | Roads should be designed to complement <br> local character. |
| Relate Road <br> to <br> Topography | Local roads are more attractive and <br> economical if constructed to closely <br> adhere to topography (minimize cut and <br> fill). | The important role that roads play in the <br> overall storm drainage system can be <br> enhanced by closely following existing <br> topography. |
| Layout Road <br> to Achieve <br> Optimum <br> Subdivision <br> of Land | The arrangement of roads should allow <br> for economical and practical patterns, <br> shapes, and sizes of adjacent lots. Roads <br> as a function of land use must not unduly <br> hinder the development of land. | Distances between roads, number of roads, <br> and related elements all have a bearing on <br> efficient subdivision of an area. Access to <br> adjoining properties should also be <br> encouraged. |

### 2.3.2 Design Standards by Functional Classification

Section 2.2.4 of these standards identifies the Roadway Functional Classifications recognized and used by the County. Table 2-4 through Table 2-7 summarize many of the minimum roadway design standards by category and functional classification. Detailed road Standard Drawings are provided in Appendix F.

### 2.3.3 Horizontal Alignment

## A. General Criteria

Proper roadway alignment provides for safe and continuous operation at a uniform design speed. Proposed road layouts shall have a logical relationship to existing or platted roads and fit within the overall transportation plan.

Chapter 2 Transportation Facilities
Adopted: 1/9/2006
Revised: 1/1/2008
REVISION 2

| 60 | 47 | 57 | 2,133 | 2,135 |
| 70 | 54 | 64 | 2,479 | 2,480 |

Figure 2-23. Total Passing Sight Distance for Two-Lane Roads

d1-distance traversed during perception an dreaction time and during initial acceleration to the point of encroachment on the left lane
d2 - distance traveled while the passing vehicle occupies the left lane
d3 - distance between the passing vehicle at the end of its maneuver and the opposing vehicle
d4 - distance traversed by an opposing vehicle for two-thirds of the time the passing vehicle occupies the left lane, or $2 / 3$ of d2

## G. Intersection sight distance

The intersection sight distance provides for vehicles to enter traffic and accelerate to the average running speed. Intersection sight distances shall be measured as shown on Figure 2-24. The intersection sight distance shall be as shown in Table 2-22.

[^4]Figure 2-24. Sight Distance Triangle (Stop Controlled)

Table 2-22. Intersection sight distance

| Higher Functional Classification Roadway Design Speed (MPH) | Intersection site distance (feet) ${ }^{1,3}$ |
| :---: | :---: |

| 40 | 445 |
| 30 | $335^{2}$ |
| 25 | $280^{2}$ |
| 'Intersection site distance measured from a point on the minor road at 13 feet back from the edge of the major road pavement ("D") and measured from a height of eye at 3.5 feet on the minor road to a height of object at 3.5 feet on the major road. <br> ${ }^{2}$ At local/local road intersections only, "D" shall be 10 feet and the sight distance shall be measured to the centerline of the road. <br> ${ }^{3}$ These values only apply to two-lane roads with stop control, all other situations require special design considerations. |  |

$$
\text { EI Paso County Engineering Criteria Manual } \begin{array}{r}
\text { M-45 }
\end{array}
$$

## 1. Sight Distance Triangles within Easements

There shall be an unobstructed sight distance along both approaches and both sides at an intersection (within the right-of-way) for distances sufficient to allow the operators of vehicles, approaching simultaneously, to see each other in time to prevent collisions at the intersection.

All sight distance triangles must be within the public right-of-way or a sight distance easement (See Figure 2-24). If the line of sight crosses onto private property, a "Sight Distance Easement" shall be dedicated to provide the required sight distance. The easement or right-of-way shall be dedicated to the County. Maintenance of a sight distance easement shall be the responsibility of the property owner or the homeowners' association unless otherwise approved by the County.

## 2. Encroachment into Sight distance Triangles or Easements

Any object within the sight distance triangle or easement more than 30 inches above the flowline elevation of the adjacent roadway shall constitute a sight obstruction, and shall be removed or lowered. The objects may include but are not limited to berms, buildings, parked vehicles on private property, cut slopes, hedges, trees, bushes, utility cabinets or tall crops. Trees may be permitted at the discretion of the ECM Administrator if pruned to at least 8 feet above the flowline elevation of the adjacent roadway.

## 3. On-Roadway Parking within Sight Distance Triangles <br> The ECM Administrator may limit on-street parking to protect visibility and enhance roadway capacity.

### 2.3.7 Intersections

## A. Intersection Design Guidelines

Intersections shall be designed to provide safe movement for all those using roadways within the County (motorists, pedestrians, and bicyclists). By their nature, intersections are conflict locations. Vehicles, pedestrians, and bicycles all cross paths. Each crossing is a conflict point. The basic design of intersections includes the following objectives:

- Minimize points of conflict
- Simplify areas of conflict
- Limit conflict frequency
- Limit conflict severity

## B. Intersection Spacing and General Access Standards

Full movement intersections and major accesses spacing shall meet the requirements in Section 2.2.5. While access to a major roadway should be avoided, right-in/right-out and three quarter movement accesses may be permitted as a deviation if they meet the criteria for sight distances, turn lane

[^5]requirements, grades and do not negatively impact traffic operations or safety. The applicant shall have the burden of proof that no other "viable or practical" property access is available. A deviation request should be supported by a traffic study or memorandum that provides information to assist the ECM Administrator in determining the proposed deviation minimizes negative safety and other operational impacts along upstream and downstream roadway segments. The addition of such an access shall minimize impacts to queuing or blocking of lane entries or access points and minimize impacts to progression. The access must be in a location such that any necessary turn lanes and acceleration/deceleration lanes can be accommodated to maintain safe operations and capacity. The analysis should consider all potential future additional requirements for to accommodate traffic generated by adjacent land uses. Buildout design hour/peak hour projected traffic volumes should be used.

## C. Intersection Alignment

## 1. Offset

All lanes traversing an intersection shall be in alignment. A maximum 2foot lane offset may be approved by the ECM Administrator if no other alternative exists.

## 2. Angle

Crossing roadways shall intersect at 90 degrees whenever possible. In no case shall roadways be permitted to intersect at less than 80 degrees or more than 100 degrees.

## 3. Horizontal Alignment

The horizontal alignment of roadways through an intersection shall be designed in conformance with this chapter depending on the classification of the roadways intersecting. Intersections may be placed on horizontal curves, provided the minimum tangent lengths shown in Table 2-11 are provided on the lower functional classification roadway and the required sight distance is met.

## 4. Vertical Alignment

The roadway profile grade shall not exceed the value presented in Table 2-23 on the approach to the intersection, as measured along the centerline of the roadway for a minimum distance equal to the grade lengths presented in Table 2-24 for each of the roadway functional classifications.

The grade of the roadway with the higher functional classification shall prevail at intersections. Grading of lower functional classifications, adjacent property, private access shall adapt to the higher functional classification roadway grade.

Chapter 2 Transportation Facilities
Adopted: 1/9/2006
Revised: 1/1/2008
REVISION 2
Section 2.3.7-2.3.7
In cases where the natural grade for which a roadway is to be constructed is steeper than 4 percent (hillside areas). A deviation from the presented standards may be requested for to accommodate these conditions up to a maximum of 8 percent.

Table 2-23. Intersection Grades by Roadway Functional Classification

| Functional <br> Classification | Maximum Intersection Grade <br> (\%) | Minimum Intersection <br> Grade (\%) |

| Expressway | n/a | n/a | 200 | $250{ }^{1}$ |
| Arterial | n/a | 120 | $200{ }^{1}$ | n/a |
| Collector | 100 | $120{ }^{1}$ | n/a | n/a |
| Local | $100{ }^{1}$ | n/a | n/a | n/a |
| ${ }^{1}$ In the case of where each intersecting roadway is of the same classification, the ECM Administrator will designate which roadway takes precedence and the distance required. |  |  |  |  |

## D. Turn Lanes Required

## 1. Exclusive Left Turn Lane Required

Exclusive left turn lanes shall be provided wherever left turn lanes are specified as being needed by an approved TIS, identified in the MTCP, required by the ECM, or determined to be warranted by the ECM Administrator. Information in the TIS shall be used to determine whether an exclusive left turn lane is warranted. Warrant determinations shall also be based on this chapter, which include:

- Expressways Left Turn Lane (State Highway Access Code Designation - EX): A left turn lane is required for any access that allows left turn ingress movement, except for field approaches. A left turn acceleration lane may be required if the design would be a benefit to safety and operation of the roadway.
- Principal Arterials Left Turn Lane (State Highway Access Code Designation - RA for Rural and NR-A for Urban): A left turn lane is required for an access with a projected peak hour left ingress turning volume of 10 VPH or greater. A left turn acceleration lane

[^6]may be required if it would be a benefit to the safety and operation of the roadway.

- Minor Arterials (State Highway Access Code Designation - RB for Rural and NR-B for Urban) and Lower Classifications Left Turn Lane: A left turn lane is required for any access with a projected peak hour ingress turning volume of 25 VPH or greater.

## 2. Exclusive Right Turn Lanes Required

Exclusive right turn lanes shall be provided wherever right turn lanes are specified as being needed by an approved TIS, identified in the MTCP, required by the ECM or determined to be warranted by the ECM Administrator. Information in the TIS shall be used to determine whether an exclusive right turn lane is warranted. Warrant determinations shall also be based on this chapter, which include:

- Expressway Right Turn Lane (State Highway Access Code Designation - EX): A right turn lane is required for any access with a projected peak hour right turn ingress turning volume of 10 VPH or greater. A right turn acceleration lane is required for any access with a projected peak hour right turn egress turning volume of 10 VPH or greater.
- Principal Arterials Right Turn Lane (State Highway Access Code Designation - RA for Rural and NR-A for Urban): A right turn lane is required for any access with a projected peak hour right ingress turning volume of 25 VPH or greater. A right turn acceleration lane is required for any access with a projected peak hour right turning volume of 50 VPH or greater when the posted speed on the roadway is greater than 40 MPH. A right turn acceleration lane may also be required at a signalized intersection if a free right-turn is needed to maintain an appropriate level of service in the intersection.
- Minor Arterials (State Highway Access Code Designation - RB for Rural and NR-B for Urban) and Lower Classifications Right Turn Lane: A right turn lane is required for any access with a projected peak hour right turning volume of 50 VPH or greater. An acceleration lane is generally not required.

## 3. Acceleration Lanes Required

Acceleration lanes shall be provided wherever acceleration lanes are specified as being needed by an approved TIS, identified in the MTCP, required by the ECM or determined to be warranted by the ECM Administrator. Information in the TIS shall be used to determine whether an acceleration lane is warranted. Warrant determinations shall be based on this chapter.
26. The specific designs for these lanes shall be in accordance with this chapter. For each high volume access and major intersection, both acceleration and deceleration lanes shall be considered in designing an exclusive left turn lane.

Figure 2-26. Design Elements for Left Turn Lanes

- Right Turn Lane. The design elements for a right turn and deceleration lanes are the approach taper, lane length, storage length, which in combination makes up the right turn lane. The elements are as shown in Figure 2-27. For each high volume access and major intersection, both acceleration and deceleration lanes shall be considered in designing an exclusive right turn lane. The specific designs for these lanes shall be in accordance with this chapter. Specific lane shift and lane drop design criteria can be found in Section 2.3.8J.3.
- Acceleration Lane. The design elements for an acceleration lane are the transition taper and acceleration length. For each high volume access and major intersection, both acceleration and deceleration lanes shall be considered in designing an exclusive right or left turn lane. The specific designs for these lanes shall be in accordance with this chapter.

Chapter 2 Transportation Facilities
Adopted: 1/9/2006
Revised: 1/1/2008
REVISION 2
Section 2.3.7-2.3.7

- Shift or Drop Lane. The design elements for a transition or drop land are the redirect taper, full width auxiliary lane, and storage length. The use and design of these elements varies based on the roadway classification and site-specific conditions.

Figure 2-27. Design Elements for Right Turn Lanes

2. Tapers

- Approach Tapers. The basis for designing a deceleration lane and taper is to provide sufficient length for a vehicle to decelerate and brake primarily outside the through traffic lanes. Table 2-25 provides the required deceleration lane and taper design lengths by design speed. Deceleration lane lengths shall be adjusted for a grade of $3 \%$ or more using the factors in Table $2-26$. The required length allows a motorist to decelerate in gear for at least 3 seconds followed by safe braking to a complete stop.

Table 2-25. Required Deceleration Lane and Taper Lengths

| Design Speed (MPH) | Lane Length (feet) | Approach Taper <br> (feet) | Total Length (feet) |
| :---: | :---: | :---: | :---: |
| 25 | 115 | 120 | 235 |
| 30 | 115 | 120 | 235 |
| 40 | 155 | 160 | 315 |
| 50 | 235 | 200 | 435 |
| 60 | 290 | 240 | 530 |
| 70 | Special Design | Special Design | Special Design |

Table 2-26. Deceleration Lane Grade Adjustment Factors

| Roadway Grade | Factors |
| :---: | :---: |
| Upgrade | 0.90 |
| $3 \%$ to $4.9 \%$ | 0.80 |
| $5 \%$ to $7.5 \%$ |  |
| Downgrade | 1.20 |
| $3 \%$ to $4.9 \%$ | 1.35 |
| $5 \%$ to $7.5 \%$ |  |

- Bay Tapers. Table 2-27 provides the required bay taper length by lane width. A bay taper is designed to direct left-turning vehicles into the turn lane. A minimum taper ratio of $8: 1$ may be used for tangent bay tapers in constrained locations. Bay tapers should be used (asymmetrical reverse curves) for deceleration transition tapers. Straight transition tapers should be avoided at design speeds above 40, and where a vertical crest or horizontal curve is present. Under these conditions, an immediate bay taper and lane striping should be substituted for a straight transition taper to reduce drifting of the through vehicles into the deceleration lane. Where horizontal or crest vertical curves exist, the ECM Administrator may require the deceleration transition taper to begin with an immediate asymmetrical reverse curve bay taper of $1 / 3 \mathrm{~L}$ then $2 / 3 \mathrm{~L}$ with the remaining required transition taper length at full lane width. Partial tangent transition tapers, symmetrical reverse curve tapers or asymmetrical reverse curve tapers may be used for transition taper design provided a radius of at least 150 feet is used in curve calculations.

Chapter 2 Transportation Facilities
Adopted: 1/9/2006
Revised: 1/1/2008
REVISION 2
Section 2.3.7-2.3.7
Table 2-27. Required Bay Taper Lengths

| Design Speed (MPH) | Lane Length (feet) | Bay Taper (feet) |
| :---: | :---: | :---: |
| 25 | 115 | 80 |
| Total Length (feet) |  |  |
| 30 | 115 | 120 |
| 195 |  |  |
| 40 | 155 | 160 |
| 50 | 235 | 200 |
| 60 | 290 | Special Design |

- Transition Tapers. The basis for designing an acceleration lane and transition taper is to provide sufficient length for a vehicle to accelerate to the appropriate speed and merge into the through traffic lanes without disrupting traffic flow. Table 2-28 provides the required acceleration lane and transition taper design lengths by design speed. Acceleration lane lengths in Table 2-28 shall be adjusted for a grade of $3 \%$ or more using the factors in Table $2-29$. The total length of the acceleration lane includes the values of both the lane and transition taper. The length of a transition taper is calculated by multiplying the width of the lane by a standard ratio. The beginning and ending point of all tapers shall be rounded.

Table 2-28. Design Criteria for Acceleration Lanes

| Design Speed (MPH) | Lane Length (feet) | Transition Taper (feet) | Total Length (feet) |
| :---: | :---: | :---: | :---: |
| 40 | 270 | 120 | 390 |
| 50 | 550 | 162 | 712 |
| 60 | 960 | 222 | 1182 |
| 70 | 1380 | 300 | 1680 |

Table 2-29. Grade Adjustment Factors for Acceleration Lanes

|  | Design Speed (MPH) |  |  |
| :--- | :---: | :---: | :---: |
| Upgrade | $\mathbf{4 0}$ to $\mathbf{5 0}$ | $\mathbf{3 0}$ |  |
| 3 to $4.9 \%$ | 1.3 | 1.5 | 1.7 |
| 5 to $7.5 \%$ | 1.5 | 2.0 | 2.5 |
| Downgrade |  |  |  |
| 3 to $4.9 \%$ | 0.7 | 0.65 | 0.6 |
| 5 to $7.5 \%$ | 0.6 | 0.55 | 0.5 |

- Redirect Tapers. Redirect tapers shall be used where an exclusive turn lane, median or other redirection of vehicles is necessary and where redirection of the flow of traffic is necessary to accommodate the exclusive turn lane or median due to constraints. Redirect tapers required for redirecting

[^7]
### 2.4 ROADWAY ACCESS DESIGN

### 2.4.1 Access Design Criteria

## A. Access Design Guidelines

Access points shall be designed to provide safe movement for both those entering and traveling on roadways within the County. Like intersections, access points are conflict locations. The basic design of access points includes the following objectives:

- Adequate spacing
- Proper alignments
- Clear sight distances
- Coordinated widths with its intended use
- Clearances from intersections

## B. Access Spacing

Accesses shall be separated by a distance equal to the entering sight distance values in Table 2-36. When turn lanes are present or will be needed in the future, the accesses shall be separated by a sufficient distance so that exclusive turn lanes including tapers will not overlap. Access shall not be permitted within a turn lane. Warrant criteria, design, and construction of turn lanes shall be governed by the requirements contained in Section 2.3.7D.
C. Access Alignment

## 1. Horizontal Alignment

Access points shall be aligned at 90 degrees to the adjacent road centerline or along a radial line in a cul-de-sac.

## 2. Vertical Alignment

Maximum access grades are $7 \%$ for commercial and industrial properties with a required 30 -foot landing width and $15 \%$ for residential properties with a required 15 -foot landing width. Access point approach grades and configuration shall be designed and constructed to accommodate the ultimate road standard of the intersecting roadway to prevent major access point reconstruction. Where an access approach will cross an existing sidewalk, the access shall be designed and constructed to match the elevation of the sidewalk where the two intersect. Reverse slope private accesses may be allowed as long as sight distance requirements are met.

## D. Access Sight Distances

Accesses and specific turn movements shall not be permitted where the sight distance is not adequate to allow the safe movement of a motorist using or passing the access. Any potentially obstructing objects, such as but not limited to advertising signs, structures, trees, and bushes, shall be designed, placed, and

[^8]Chapter 2 Transportation Facilities
Adopted: 1/9/2006
Revised: 1/1/2008
REVISION 2
Section 2.4.1-2.4.1
maintained at a height not to interfere with the sight distance needed by any vehicle using the access. Reconstruction of the horizontal and vertical curvature along the roadway or side slopes adjacent to the roadway may be necessary to increase sight distances.

## 1. Sight Distance Along Roadways

Horizontal and vertical sight distances shall conform to Table 2-33 for the vehicle traveling on the roadway toward the access. The lengths shown in Table 2-34 shall be adjusted for any grade of $3 \%$ or greater using the figures set forth in Table 2-35.

Table 2-34. Minimum Sight Distance Along Roadway (Horizontal and Vertical)

| Posted Speed (MPH) | $\mathbf{2 5}$ | $\mathbf{3 0}$ | $\mathbf{3 5}$ | $\mathbf{4 0}$ | $\mathbf{4 5}$ | $\mathbf{5 0}$ | $\mathbf{5 5}$ | $\mathbf{6 0}$ | $\mathbf{6 5}$ | $\mathbf{7 0}$ |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Design Sight distance (feet) | 150 | 200 | 250 | 325 | 400 | 475 | 550 | 650 | 725 | 850 |
| Minimum Sight distance <br> (feet) $)^{1,2}$ | 150 | 200 | 225 | 275 | 325 | 400 | 450 | 525 | 550 | 625 |

${ }^{1}$ To calculate sight distance at the proposed access location, a height of 3.5 feet shall be used for the driver's eyes of a vehicle on the highway approaching the access location. The driver's eyes shall be assumed to be at the centerline of the inside lane (inside with respect to the curve) for measurement purposes. A height of 3.5 feet shall be used for a vehicle assumed to be on the centerline of the access 5 feet back from the edge of the roadway.
${ }^{2}$ If an auxiliary lane is present, the entering posted speed for the deceleration lane and the posted speed at the end of the acceleration lane shall be used.

Table 2-35. Sight distance Adjustment Factors for Roadway Grade

| Roadway Grade | Factors |
| :--- | :---: |
| Upgrade |  |
| $3 \%$ to $4.9 \%$ | 0.90 |
| $5 \%$ to $7.5 \%$ | 0.80 |
| Downgrade |  |
| $3 \%$ to $4.9 \%$ | 1.20 |
| $5 \%$ to $7.5 \%$ | 1.35 |

## 2. Entering Sight Distance

The entering sight distance necessary for the entering vehicle shall conform to Table 2-36. These lengths shall be adjusted for any grade of $3 \%$ or greater using Table 2-35. The design vehicle used to determine the entering sight distance shall be selected from Table 2-37.
If the median provides at least 20 feet of storage for a crossing or turning vehicle and can safely store the design vehicle, then the sight distance may be calculated assuming a two-stop condition.

[^9]Table 2-36. Entering Sight Distance (Access Design)

| Design Vehicle ${ }^{3}$ | Posted Speed of Roadway (MPH) |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | 25 | 35 | 45 | 55 | 65 |
| Two Lane Roadway ${ }^{\text {1,2 }}$ |  |  |  |  |  |
| Passenger Cars, Pickup Trucks | 250 | 350 | 450 | 550 | n/a |
| Single Unit Trucks | 325 | 455 | 585 | 715 | $\mathrm{n} / \mathrm{a}$ |
| Multi-Unit Trucks | 425 | 595 | 765 | 935 | n/a |
| Four Lane Roadway ${ }^{\text {1,2 }}$ |  |  |  |  |  |
| Passenger Cars, Pickup Trucks | n/a | 420 | 540 | 660 | 780 |
| Single Unit Trucks | n/a | 525 | 675 | 825 | 975 |
| Multi-Unit Trucks | n/a | 700 | 900 | 1,100 | 1,300 |
| Six Lane Roadway ${ }^{\text {1,2 }}$ |  |  |  |  |  |
| Passenger Cars, Pickup Trucks | n/a | n/a | 585 | 715 | 845 |
| Single Unit Trucks | n/a | n/a | 765 | 935 | 1,105 |
| Multi-Unit Trucks | n/a | n/a | 945 | 1,155 | 1,365 |
| ${ }^{1}$ For calculating sight distance, a height of 3.5 feet shall be used for the driver's eyes at the access location and a height of 3.5 feet for the oncoming vehicle. The entering driver's eyes shall be 10 feet behind the edge of the roadway. <br> ${ }^{2}$ If an auxiliary lane is present, the entering posted speed for the deceleration lane and the posted speed at the end of the acceleration lane shall be used. <br> ${ }^{3}$ From Table 2-37. |  |  |  |  |  |

Table 2-37. Design Vehicle Selection

| Land Use(s) Served by Access | Design Vehicle |
| :--- | :---: |
| Residential, Non-School Bus Route | Passenger Cars, Pickup Trucks |
| Residential, School Bus Route | Single Unit Trucks |
| Office | Single Unit Trucks |
| Recreational | Single Unit Trucks |
| Commercial/Retail | Multi-Unit Trucks ${ }^{1}$ |
| Industrial | Multi-Unit Trucks ${ }^{1}$ |
| Agricultural Field Approaches (< 1 VPD) | Single Unit Trucks |
| ${ }^{1}$ If less than 2 multi-unit truck trips per day (average), use single-unit truck |  |

## E. Access Width

1. Residential Access Points

Two-way residential access points shall have a 10-foot minimum and a 24-foot maximum width.
2. One-Way Commercial or Industrial Access Points

One-way commercial or industrial access points shall have a minimum 15 -foot and a maximum 30-foot inbound access, and a minimum 20 -foot and maximum 35 -foot outbound access width.
