JURISDICTION

County of El Paso

DESIGN ENGINEER'S STATEMENT:

The attached Drainage Plan and Report were prepared under my direction and supervision and are correct to the best of my knowledge and belief. Said Drainage Report has been prepared according to the criteria established by the County for drainage reports and said report is in conformity with the applicable master plan of the drainage basin. I accept responsibility for any liability caused by any negligent acts, errors or omissions on my part in preparing this report.

Anthony E. Merlino, P.E. #60820

INTRODUCTION

PURPOSE OF STUDY

This document is the Drainage Report for 5810 Omaha Boulevard, Colorado Springs, Colorado 80915. The proposed development includes a building footprint of 950 square feet and a 272-square-foot trash enclosure. The planned site improvements include paved asphalt driving area, reinforced concrete driving area, on-site sidewalk area, and landscaping. This report is to summarize the drainage improvements for the Dutch Bros Coffee and is intended to demonstrate that the drainage improvements for the proposed project are in conformance with El Paso County and will not negatively impact downstream drainage facilities, surrounding development, and receiving water course.

LOCATION

This project is located on the northwest corner of Powers Boulevard and Omaha Boulevard, Colorado Springs, Colorado and is currently an existing gas station. The parcel is bounded by Powers Boulevard to the west, existing commercial development on the east and north, and Omaha Boulevard to the south. The site is within the El Paso County jurisdiction. Refer to Appendix A for a Vicinity Map.

DESCRIPTION OF SITE

The property is zoned as Commercial Regional. The parcel is approximately 0.62 acres. The disturbed area consists of approximately 0.62 acres. The existing site is currently an existing gas station. The site has an existing drainage system with existing drainage inlets near the south side of the site. There is an existing storm drain system located near the south end of the site. Overall, the site slopes from the northeast to the southwest.

SOILS

Per the Natural Resources Conservation Service web soils survey, soils for this project, delineated on the soils map within Appendix B of this report, are classified as Blendon Sandy Loam. Blendon Sandy Loam has been classified as Hydrologic Soil Type "B". The study area consists of undeveloped land with sparse, grassy vegetation.

FLOODPLAIN STATEMENT

Subject property is located in Zone "X" (Area determined to be outside the 0.2% annual chance floodplain) per the flood insurance rate map for County of El Paso, Colorado map number 08041C0751G, revised December 7, 2018.

PROJECT BACKGROUND

EXISTING DRAINAGE

In existing conditions, Basin A-1 is approximately 0.55 acres and approximately 89% impervious. The site generally sheet flows from the northeast to the southwest. The runoff currently sheet flows towards curb and gutter along the south side and is conveyed to and collected by dual inlets located near the parking area. The runoff is then conveyed via an existing 18-inch storm drain.

The composite runoff coefficient for the 10-year and 100-year is 0.83 and 0.88 respectively for Hydrologic Soil Type B per Table 5-1 of the El Paso County Drainage Criteria Manual (EPCDM). A minimum time of concentration of 5 minutes was utilized to calculate the flow rate. The rainfall intensity is approximately 6 in/hr for the 10-year storm event and 9 in/hr for the 100-year storm event per Figure 5-1 of the EPCDM. The runoff is approximately 2.75 cfs for the 10-year and 4.40 cfs for the 100-year storm event. Refer to Appendix D for Table 5-1 and Figure 5-1.

Refer to Appendix B for Existing Conditions Drainage Map and Appendix C for Hydrology Calculations.

PROPOSED DRAINAGE

In proposed conditions, the Dutch Bros site proposes more landscaping than existing conditions, which reduces the amount of runoff than existing conditions. The site is approximately 70% impervious, which is less than existing conditions at 89% impervious. Therefore, it is anticipated that the discharge and impact to the existing storm infrastructure will be negligible and even less than the existing condition.

HYDROLOGIC AND HYDRAULIC DESIGN

BASINS

Basin A-1

Basin A-1 is approximately 0.47 acres and approximately 74% impervious. The runoff maintains a similar drainage pattern as existing conditions and sheet flows northeast to the southwest. Runoff sheet flows towards curb and gutter and is conveyed towards curb cuts along the south curb and gutter. Runoff will then flow through the curb cuts and along graded swale and collected by a proposed drainage inlet that will convey the runoff via storm drain and connect to an existing 30-inch storm drain.

The composite runoff coefficient for the 10-year and 100-year storm event is 0.73 and 0.79 respectively for Hydrologic Soil Type B per Table 5-1 of the EPCDM. A minimum time of concentration of 5 minutes was utilized to calculate the flow rate. The rain fall intensity is 6 in/hr for the 10-year storm event and 9 in/hr for the 100-year storm event per Figure 5-1 of the EPCDM. The runoff is approximately 2.06 cfs for the 10-year and 3.36 cfs for the 100-year event.

Basin A-2

Basin A-2 is approximately 0.10 acres and approximately 53% impervious. The runoff maintains a similar drainage pattern as the existing conditions and sheet flows towards the south. Runoff sheet flows towards curb and gutter and is conveyed towards a curb cut along the eastern property line. Runoff will then flow through the curb cut and is conveyed along graded swale and collected by the existing dual drainage inlets. The runoff is then conveyed via an existing 18-inch storm drain.

The composite runoff coefficient for the 10-year and 100-year storm event is 0.59 and 0.67 respectively for Hydrologic Soil Type B per Table 5-1 of the EPCDM. A minimum time of concentration of 5 minutes was utilized to calculate the flow rate. The rain fall intensity is 6 in/hr for the 10-year storm event and 9 in/hr for the 100-yr storm event per Figure 5-1 of the EPCDM. The runoff is approximately 0.34 cfs for the 10-year and 0.57 cfs for the 100-year event.

The total area between Basin A-1 and A-2 is 0.57 acres. The total flow between Basin A-1 and A-2 is about 2.4 cfs for the 10-year and 3.93 cfs for the 100-year storm events. Refer to Appendix B for the Proposed Conditions Drainage Map and Appendix C for the Hydrology Calculations.

WATER QUALITY EXEMPTION

The proposed site is disturbing approximately 0.62 acres. Storm water quality is not required for any project disturbing activity less than 1 acre per the El Paso County Drainage Criteria Manual.

HYDRAULIC DESIGN

The proposed drainage inlet and storm drain were sized based on the 100-year design storm using the Hydraflow Express. A Manning's n of 0.011 was used for the PVC storm drain and 0.035 for a graded swale. Refer to Appendix C for the Hydraulic Calculations.

MAINTENANCE

All drainage facilities within the public right-of-way shall be the responsibility of El Paso County.

SUMMARY

It has been concluded that the proposed project and the constructed improvements will maintain the thresholds of the existing conditions. The proposed project is less than an acre; therefore, the site is exempt from water quality requirements. The site maintains existing drainage patterns to the maximum extent possible. The site also reduces the amount of existing impervious area from 89% impervious in existing conditions to 70% impervious in proposed conditions. The total runoff of 2.40 cfs for the 10-year and 3.93 cfs for the 100-year storm event is less than the existing flow rates of 2.75 cfs for the 10-year and 4.40 cfs for the 100-year storm event. Therefore, the proposed site is in conformance with the El Paso County standards and requirements and does not negatively impact downstream facilities, surrounding areas, and receiving water courses.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
 Web Soil Survey URL:
 Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: El Paso County Area, Colorado
 Survey Area Data: Version 21, Aug 24, 2023

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Aug 19, 2018—Sep 23, 2018

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

10	Blendon sandy loam, 0 to 3 percent slopes	B	10.9	100.0%
Totals for Area of Interest			10.9	100.0%

Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

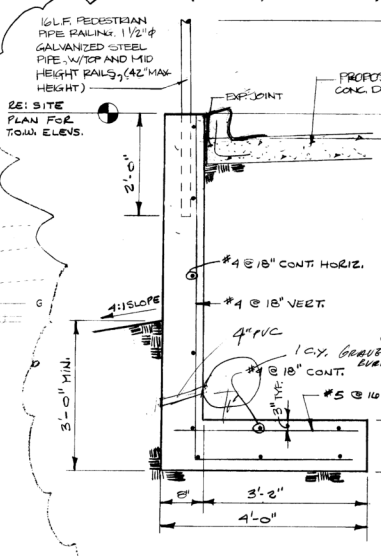

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.
