RE: Struthers Ranch Subdivision Filing No. 5<br>Traffic Impact Study<br>El Paso County, Colorado<br>LSC \#204110

Dear Mr. Weiss:

LSC Transportation Consultants, Inc. has prepared this traffic impact study for the proposed Struthers Ranch Subdivision Filing No. 5 development in El Paso County, Colorado. The development is planned to be located southeast of the intersection of Struthers Road/Struthers Ranch Road. The planned land use is for 19,740 square feet of retail, 5,200 square feet of office, and 5,200 square feet of restaurant. This report has been prepared for submittal to El Paso County.

## REPORT CONTENTS

The preparation of this report included the following:

- Inventory of the existing adjacent and nearby area street and roadway system. This includes functional classifications, street widths, lane configurations, intersection traffic control, posted speed limits, pavement markings, intersection and access spacing, roadway and intersection alignments, auxiliary left- and right-turn lanes, intersection sight distances, etc.;
- A review of the proposed site land use and access locations;
- Morning and evening peak-hour traffic counts at the intersection of Struthers Road/Struthers Ranch Road;
- Estimates of short- and long-term background traffic volumes and total traffic (site traffic plus background traffic). Forecasts include buildout of adjacent proposed developments;
- Estimates of the daily and peak-hour trip generation for the proposed land use;
- The estimated directional distribution of site-generated vehicle trips on the study-area street and roadway system;
- Projections of peak-hour site-generated turning-movement traffic volumes at the study area intersections, which include:
- Site access point intersections
- Struthers Road/Struthers Ranch Road
- Level of service ( $\cap \subset)$ analusic at the cturv area intersertions-
- Evaluation of th Elaborate on the specific manual used and update the reference he potential need list. Did you use "A Policy on Geometric Design of Highways at the site acce: and Streets" (greenbook)?
- Findings and re

## PREVIOUS TRAFFIC ST

What is the specific section? Which Intersection Case did you use?

- Add the reference tables, charts, etc used.

Nearby properties hat - Provide the SSD computation in the appendix.

- Monument Rid - State the vertex (decision point) in the minor road in
- Monument Rid measuring the line of sight from edge of travel lane.
- Cathedral Rock

This report is consistent with the above reports and includes the proposed developments in the background traffic volumes.

## LAND USE AND ACCESS

Figure 1 shows the site location relative to the adjacent and nearby roadways. The site plan is shown in Figure 2. The Cathedral Rock Church is planned for the adjacent Tract A on the north side of Struthers Ranch Road. As shown in Figure 2, two access points are proposed: a full movement access onto Struthers Ranch Road across from the proposed access to Cathedral Rock Church, and a right-in/right-out access onto Struthers Road.

Struthers Ranch Subdivision Filing No. 5 is proposed to include 19,740 square feet of retail, 5,200 square feet of office, and 5,200 square feet of restaurant.

## INTERSECTION SIGHT DISTANCE

The required stopping sight distance on Struthers R $\phi$ ad is 425 feet ( 50 mph design speed, assuming grades three-percent or less).

The intersection sight distance for the intersection of \$truthers Road/Struthers Ranch Road has been calculated using AASHTO criteria because the intersection sight distance contained in Table 2-21 of the Engineering Criteria Manual (ECM) only applies to two-lane roads with stop control. As Struthers Road has two through lanes in each direction plus a center median, the sight distance has been calculated using the formula $d=1.47 * V_{m} * t_{c}$ where $V_{m}$ is the design speed in miles per hour and $t_{c}$ is the gap for drivers entering the major roadway (in seconds). The acceptable gap time has been increased from the typical 7.5 seconds for a passenger vehicle on a two-lane
road to 8.75 seconds to account for multiple lanes and the median. Likewise, the acceptable gap for a corfbination truck has been increased from 11.5 seconds to $7 \overline{7} .25$ seconds. This calculation results 1 in a required intersection sight distance is 645 feet for passenger vehicles and 975 feet for combination trucks. A single unit truck would require 825 feet of sight distance.
the field-measured sight distance at this intersecton is 450 feet for passenger vehicles and 550
Elaborate on the time gap used for the passenger car, single truck and combination truck.
Example: On the passenger vehicle the greenbook noted adding 0.5 s for each additional lane crossed in excess of one. This would only result in 8.5 s (based on crossing one lane and the median lane). What is the reasoning for the additional 0.25 s

Also, identify the time gap used for the single unit truck.
of Struthers Ranch Road. Given the sight distance for trucks compared to the AASHTO standard, it is recommended that a "Left Turn Prohibited" sign with a "Trucks" supplemental sign panel be installed at the westbound approach to the Struthers Road/Struthers Ranch Road intersection.

To the south, the sight distance only needs to cover the northbound lanes, so the sight distance calculation does not need to include the extra distance of the median. Therefore, a passenger car needs 590 feet of sight distance of, a single-unit truck would require 750 feet, and a combination truck would require 900 feet. The criterion to the south could be met for passenger cars provided the intersection line of sight "triangle" is kept free of: Quantify. Identify the uld limit the line of sight needed to maintain ECM prescribed sight di: recommend value of improvements include landscaping, monument signs, parking areas, bel truck driver eye it to maintain passenger car line of sight is 18 inches to 30 inches above th height for design. road per ECM 2.3.6.G.2.

Obstruction height to maintain truck line of sight is higher as the truck "driver's eye" is significantly higher than the "driver's eye" for a passenger vehicle. However, the required sight distance for single-unit and combination trucks passes over the proposed parking lot. As a result, the necessary line of sight across the inside of the horizontal curve of Struthers Road has the potential to be blocked by parked vehicles. Therefore, it is recommended that a "Left Turn Prohibited" sign with a "Trucks" supplemental sign panel be installed at the westbound approach to the Struthers Road/Struthers Ranch Road intersection. Additionally, it is recommended that internal wayfinding signs be posted that instruct combination trucks to exit the site only via the right-in/right-out.

The required sight distance for the right-in/right-out access point onto Struthers Road is 450 feet for passenger vehicles and 765 feet for a combination truck per ECM Table 2-35. The line of sight to arriving northbound through traffic on Struthers is over one quarter mile.

The required sight distance for the access point onto Struthers Ranch Road is 250 feet for passenger vehicles and 425 feet for combination trucks. Sight distance analysis exhibits are attached.

## ROAD AND TRAFFIC CONDITIONS

## Area Roads

Figure 1 shows the streets in the vicinity of the site. The streets adjacent to the site are identified below, followed by a brief description of each:

Struthers Road is a four-lane, median-divided road that extends north from North Gate Boulevard to the intersection of Baptist Road and Jackson Creek Parkway. Struthers Road is classified as a four-lane Urban Minor Arterial on the El Paso County Major Transportation Corridors Plan and has a speed limit of 45 miles per hour (mph) about 325 feet north of Air Garden Lane (adjacent to the south portion of the site). South of this point, the posted speed limit is 40 mph .

Struthers Ranch Road is classified as a local roadway. Struthers Ranch Road is an east/west road that extends from Struthers Road into the Struthers Ranch residential development. The roadway has a posted speed limit of 25 mph . The intersection with Struthers Road is unsignalized. The roadway at the intersection with Struthers Road is 32 feet wide, which only allows for a shared westbound left/right lane on the minor street approach. Struthers Road has a 340 -foot southbound left-turn deceleration lane and a 260 -foot northbound right-turn deceleration lane at the intersection with Struthers Ranch Road.

## Traffic Volumes

Morning and evening peak-hour turning-movement traffic counts were conducted March 2020 at the intersection of Struthers Road/Struthers Ranch Road. It was noted that the southbound through traffic during the evening peak was unusually high. A second evening count was completed in April 2021. The morning and evening peak-hour volumes are shown in Figure 3. Traffic count reports are attached for reference.

## Crash History

Three years of crash data were collected at the intersection of Struthers Road/Struthers Ranch Road. There was only one crash during the study period. The only crash was a fixed object type crash that resulted in property damage only. No correctable crash patterns were identified.

## TRIP GENERATION

Estimates of the vehicle trips projected to be generated by the proposed development have been made using the nationally published trip-generation rates from Trip Generation, $10^{\text {th }}$ Edition, 2017 by the Institute of Transportation Engineers (ITE). Table 1, below, presents a summary of the estimated site trip generation on a typical weekday. The detailed trip-generation estimate for the development, including ITE rates for the proposed land use, is presented in Table 3.

Approximately 2,986 total vehicle trips are projected to enter and exit the site at the access point ("driveway trips") on the average weekday during a 24 -hour period. During the morning peak hour, approximately 170 vehicles would enter and 98 vehicles would exit the site. During the evening peak hour, approximately 101 vehicles would enter and 112 vehicles would exit the site.

The proposed development is projected to generate approximately 1,776 (new/non-pass-by or diverted) vehicle trips on the average weekday during a 24 -hour period.

Table 1: Estimated External Site Vehicle-Trip Generation (Vehicles per Hour)

| Analysis Period | Total Trips |  |  | Pass-by Trips |  |  | New Trips |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | In | Out | Total | In | Out | Total | In | Out | Total |
| A.M. Peak Hour | 170 | 98 | 268 | 53 | 53 | 106 | 117 | 45 | 162 |
| P.M. Peak Hour | 101 | 112 | 213 | 43 | 43 | 86 | 58 | 69 | 127 |
| Daily/24-Hour | 1,493 | 1,493 | 2,986 | 605 | 605 | 1,210 | 888 | 888 | 1,776 |

## Internal Trips

Internal trips are trips that occur within the site and do not impact the external roadways. Because the site is planned to have multiple retail, office, and restaurant pads, some of the generated trips will be traveling within the site. Table 3 includes estimates of internal trip capture to account for trips generated within the site as well as non-motorized trips from adjacent and nearby developments.

## Pass-by Trips

The trips generated by the site have also been aggregated by trip type to account for the pass-by phenomenon. A pass-by trip is one made by a motorist who would already be on an adjacent road regardless of the proposed development, but who stops in at the site while passing by. The pass-by motorist would then continue on his or her way to a final destination in the original direction. For purposes of this report, pass-by trips are trips by motorists already traveling through the intersection of Struthers Road/Struthers Ranch Road. Pass-by trips are shown in Table 3 and are based on Trip Generation Handbook - An ITE Proposed Recommended Practice, 3rd Edition, 2014 by ITE.

## BACKGROUND TRAFFIC

Background volumes do not include projected traffic to be generated by the proposed development. As noted in the existing conditions section, the southbound through traffic during the evening peak was unusually high. This volume was modified in the background to reflect expected volumes.

## Short-Term Background Traffic Volumes

Figure 4 shows the projected background traffic volumes. The projected volumes assume that the following nearby developments have been constructed:

- Monument Ridge Lots 7 \& 8
- Cathedral Rock Church
- Monument Ridge Apartments

## Long-Term Background Traffic Volumes

Figure 5 shows the projected 20 -year background traffic volumes for the year 2040. The long-term scenario includes the developments in the short-term background. In addition, the long-term background traffic assumes a growth of approximately 3 percent per year of through traffic on Struthers Road. This rate is based on growth shown in the Pikes Peak Council of Governments travel demand model and is similar to growth shown in the area in the 2016 Major Transportation Corridors Plan (MTCP). No improvements to the study roads are shown in the MTCP.

## TRIP DISTRIBUTION AND ASSIGNMENT

## Trip Directional Distribution

Estimation of the directional distribution of site-generated vehicle trips to the study-area roads and intersections is a necessary component in determining the site's traffic impacts. Figure 6 shows the short-term and long-term directional distribution estimates for the proposed development. Estimates were based on the following factors: existing area development, the area roadway system, and the site's proposed land use.

## Site-Generated Traffic

Site-generated traffic volumes at the study intersections have been calculated by applying the directional-distribution percentages estimated by LSC (from Figure 6) to the trip-generation estimates (from Table 1). Figure 7 shows the projected site-generated traffic volumes for the proposed development.

## Short-Term Total Traffic Volumes

Figure 8 shows the sum of the short-term background traffic volumes (from Figure 4) and the site-generated peak-hour traffic volumes (shown in Figure 7). These volumes represent the projected short-term total traffic following construction of the development.

## Long-Term Total Traffic Volumes

Figure 9 shows the projected 2040 total traffic volumes, which are the sum of 2040 background traffic volumes (from Figure 5) plus the site-generated traffic volumes (from Figure 7).

## LEVEL OF SERVICE ANALYSIS

Level of service (LOS) is a quantitative measure of the level of congestion or delay at an intersection and is indicated on a scale from "A" to " $F$." LOS A is indicative of little congestion or delay. LOS F indicates a high level of congestion or delay. Table 2 shows the level of service delay ranges for signalized and unsignalized intersections.

Table 2: Intersection Levels of Service Delay Ranges

| Level of Service | Signalized Intersections | Unsignalized Intersections <br> (seconds per vehicle) |
| :---: | :---: | :---: |
|  | Average Control Delay <br> (seconds per vehicle) ${ }^{(1)}$ |  |
|  | 10.0 sec or less | 10.0 sec or less |
| C | $20.1-20.0 \mathrm{sec}$ | $10.1-15.0 \mathrm{sec}$ |
| D | $35.1-55.0 \mathrm{sec}$ |  |
| E | $55.1-80.0 \mathrm{sec}$ | $15.1-25.0 \mathrm{sec}$ |
| F | 80.1 sec or more | $25.1-35.0 \mathrm{sec}$ |
| (1) | $35.1-50.0 \mathrm{sec}$ |  |

(1) For unsignalized intersections if $\mathrm{V} / \mathrm{C}$ ratio is greater than 1.0 the level of service is LOS F regardless of the projected average control delay per

The intersections of Struthers Road/Struthers Ranch Road, as well as the site access points, have been analyzed to determine the projected control delay and corresponding levels of service for turning movements. Figure 3 provides the existing levels of service. Figure 4 and Figure 5 provide the background levels of service for the short-term and long-term scenarios, respectively. Figure 8 and Figure 9 provide the levels of service of the short-term and long-term total traffic scenarios, respectively.

## Struthers Road/Struthers Ranch Road

The yielding turning movements at the unsignalized intersection of Struthers Road/Struthers Ranch Road currently operate at LOS B or better during both the morning and evening peak hours. In the short-term future, the yielding turning movements are forecast to operate at LOS C or better during both peak hours, with and without the proposed development.

In the long-term future, the yielding turning movements are also forecast to operate at LOS C or better without the proposed development. With the addition of the site-generated traffic, the
outbound movement is projected to operate at LOS C during the morning peak and LOS E during the evening peak. During the evening peak, the outbound movement is expected to experience an average of 64 seconds of delay. This intersection is not anticipated to meet signal warrants.

## Site Accesses

In all scenarios, the yielding turning movements operate at LOS B or better during both peak hours.

## AUXILIARY TURN LANES

As mentioned previously, there is a 340-foot southbound left-turn deceleration lane at the intersection of Struthers Road/Struthers Ranch Road. This lane meets the ECM auxiliary-lane criteria and does not need to be modified with the development.

There is a 400-foot northbound right-turn deceleration lane (combined lane plus taper length) at this intersection of Struthers Road/Struthers Ranch Road. This auxiliary lane, although it exists, is not currently required per the ECM and is not expected to be required in the future with added site-generated traffic. The turning-volume threshold could potentially be met on Sunday mornings with addition of future church traffic. The turn lane already exists and is about 400 feet (lane plus taper). The ECM requirement is 435 feet.

The right-in/right-out access on Struthers Road is anticipated to require a right-turn deceleration lane. This criterion calls for 370 -foot-long deceleration distance (lane plus taper) based on a $45-\mathrm{mph}$ design speed and a 435 -foot-long deceleration distance (lane plus taper) for a $50-\mathrm{mph}$ design speed. The speed limit currently changes just south of the access location. LSC recommends an approximately 200 -foot-long lane plus a 75 -foot-long reverse curve bay taper. This would likely allow the lane to be installed, given the limited space adjacent to the developed property to the south. No acceleration lanes are required on Struthers Road.

The access on Struthers Ranch Road meets the threshold for requiring an eastbound right-turn lane per the ECM because the turning volume exceeds the 50 -vph threshhold. However, the eastbound left and through volumes are low enough that the location does not need a turn lane. Per section 3.5 in the CDOT State Highway Acfess Code, right-turn deceleration lanes may be dropped if volume in the travel lane is predicted to be less than 150 DHV.

Although not anticipated to be required based on projected volumes or levels of service, It is recommended that right-of-way be reserved in case Struthers Ranch Road needs minor widening in the future to allow for separate right- and left-turn lanes in the westbound direction at the

Submit a deviation request for the right turn lane exclusion for the ECM Administrator's consideration.

## VEHICLE QUEUING

At the intersection of Struthers Road/Struthers Ranch Road, there are 250 feet available for vehicle queueing to the east, prior to the site access. The $95^{\text {th }}$ percentile queue length for the westbound approach at the intersection is anticipated to be 125 feet, which will not impact the site access. If Struthers Ranch Road were widened in the future to provide separate right- and left-turn lanes on the westbound approach the intersection, then the $95^{\text {th }}$ percentile queue for the westbound left is forecast to be 75 feet, which also would not impact the access to the east.

## PEDESTRIAN AND BICYCLE ACCOMMODATION

A sidewalk exists along Struthers Road adjacent to the site. However, there are currently no sidewalks along Struthers Ranch Road adjacent to the site. It is recommended that a sidewalk be constructed adjacent to the site on Struthers Ranch Road.

There are no bike lanes on Struthers Road and the roadway is not planned to have bike lanes. However, there are sections of Struthers Road that have paved outside shoulders to accommodate cyclists.

## COUNTY DEVIATION REQUESTS

A deviation request is included with this application. Please refer to the deviation request form (separate document) for access to a Minor Arterial.

## COUNTY ROAD IMPROVEMENT FEE PROGRAM

## Transportation Impact Fees

Per ECM Appendix B: State what the current applicable Transportation Impact Fees are and what option the developer will be selecting for payment.

The applicant intends to opt out of the PID options and will pay the full fee amount at the time of building permit. The current "full-fee" is $\$ 4,958$ per 1,000 square feet of building floor area. The total fee amount for the 30,140 square foot of commercial buildings is $\$ 149,434$.

## Reimbursable MTCP Improvements

There are no apparent reimbursable improvements programmed in the MTCP in the general vicinity of this site.

## FINDINGS AND CONCLUSIONS

- The site is projected to generate approximately 2,986 external vehicle trips on the average weekday. Approximately half of this traffic is expected to be pass-by traffic.
- During the morning peak hour, approximately 170 vehicles would enter and 98 vehicles would exit the site. During the evening peak hour, approximately 101 vehicles would enter and 112 vehicles would exit the site at the access points.
- The site improvements, landscaping, signage etc. will need to accommodate the driver sight distance lines of sight necessary to meet the prescribed intersection sight distance at Struthers Road/Struthers Ranch Road. Please refer to the Sight Distance section for details.
- Turning movements at the site accesses are projected to operate at acceptable levels of service in all scenarios.
- The westbound approach at the intersection of Struthers Road/Struthers Ranch Road is projected to operate at LOS C in the long-term morning peak hour and LOS E during the longterm evening peak hour.
- The $95^{\text {th }}$ percentile queues at all study intersection are not projected to impact adjacent intersections.
- Please refer to the sight distance section for recommendations based on the sight-distance analysis.
- See Table 4 for a summary of recommended improvements.

Table 4: Recommended Improvements

| Item \# | Location | Improvement | Timing |
| :---: | :---: | :---: | :---: |
| 1 | Struthers Ranch Road - Adjacent to the site | Sidewalk | With development of the site |
| 2 | Struthers Road/Struthers Ranch Road | Reserve half-ROW or at least a "reservation" strip along the south side of Struthers Ranch Road to allow for potential future widening on the east leg/westbound approach to accommodate separate left/right turn lanes if these ever become necessary. | With the Site Development Plan |
| 3 | Struthers Road/South Site Access | Northbound Right Turn Deceleration Lane | With development of the site |
| 4 | Site | Install signing instructing trucks to use the right-in/right-out to exit the site | With development of the site |
| Sonece: LSC Transportation Consultants, Inc. (4-22-2021) |  |  |  |

Add the left turn prohibited sign w/ trucks
of Struthers Ranch Road. Given the sight distance for trucks compared to the AASHTO standard, it is recommended that a "Left Turn Prohibited" sign with a "Trucks" supplemental sign panel be installed at the westbound approach to the Struthers Road/Struthers Ranch Road intersection.

Please contact me if you have any questions regarding this report.
