## I. Introduction

### Project Overview

This traffic impact study is provided as a planning document and addresses the capacity, geometric, and control requirements associated with the development entitled Jones Road Property.

This proposed residential development consists of a single-family home community on approximately 753 acres of land. The development is located north of Jones Road and east of Murr Road in El Paso County, Colorado.

### Study Area Boundaries

The study area to be examined in this analysis encompasses the Jones Road intersections with Curtis Road, Murr Road, and Peyton Highway, the Peyton Highway intersections with State Highway 94 and Falcon Highway, the Falcon Highway intersection with Murr Road, and includes site access drives.

Figure 1 illustrates location of the site and study intersections.

### Site Description

Land for the development is currently vacant and zoned as A-35 (Agricultural), a zoning district intended to accommodate rural communities and lifestyles. The area is surrounded by open space and residential land uses.

The proposed development will rezone into the RR-2.5 (Residential Rural) zoning district, intended to accommodate 2.5-acre, low-density, rural, single-family residential developments. While the proposed zoning district allows for a potential maximum of approximately 300 residential lots, the site plan is conceptual. However, for purposes of this analysis, there is assumed to be construction for approximately 244 single-family residential lots.

Proposed access to the development is provided via two full-movement accesses onto Jones Road (referred to as Access A and Access B). Access drives internal to the overall development area were not included in this analysis as internal intersection operations are expected to be comparable to, or better than, those projected for the above-described intersections.

For purposes of this study, it is anticipated that development construction would be completed by end of Year 2025.

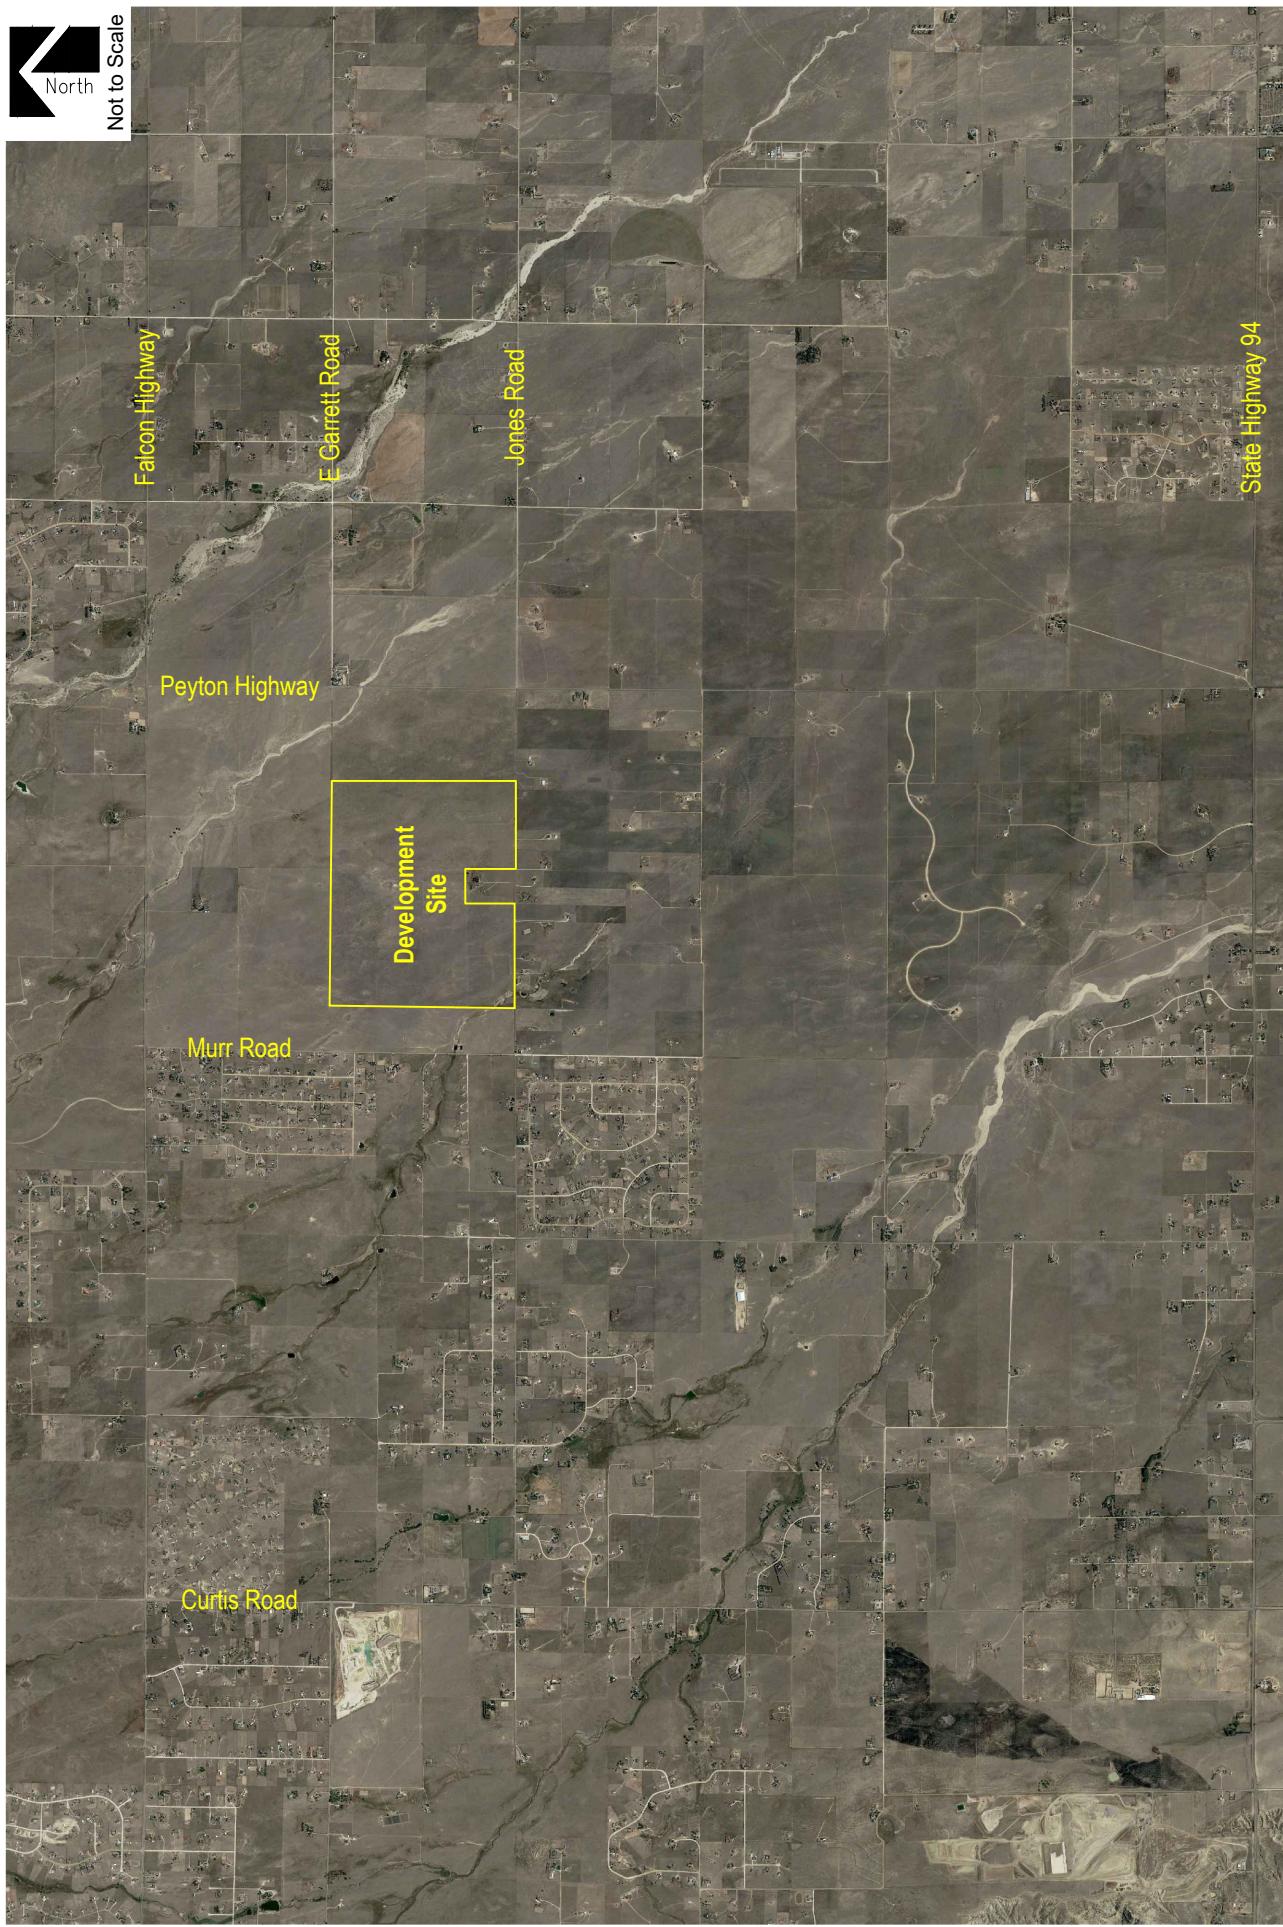

No longer accurate. Please revise to current projections.

General site and access locations are shown on Figure 1.

A conceptual site plan, as prepared by N.E.S. Inc., is shown on Figure 2. This plan is provided for illustrative purposes only.

## Existing and Committed Surface Transportation Network

Within the study area, Jones Road is the primary roadway that will accommodate traffic to and from the proposed development. The secondary roadways include Curtis Road, Murr Road, Peyton Highway, Falcon Highway, and State Highway 94. A brief description of each roadway, based on the County's 2016 Major Transportation Corridors Plan (MTCP)<sup>1</sup>, is provided below:

Use the 2024 updated MTCP throughout TIS.

Jones Road is an east-west minor arterial roadway having two through lanes (one lane in each direction) with shared turn lanes at the intersections within the study area. Jones Road provides a posted speed limit of 45 MPH.

Curtis Road is a north-south principal arterial roadway having two through lanes (one lane in each direction) with shared turn lanes at the intersection within the study area. Curtis Road provides a posted speed limit of 45 MPH.

Murr Road is a north-south local roadway having two through lanes (one lane in each direction) with shared turn lanes at the intersections within the study area. Murr Road provides a posted speed limit of 30 MPH.

Peyton Highway is a north-south minor arterial roadway having two through lanes (one lane in each direction) with shared turn lanes at the intersections within the study area. Peyton Highway provides a posted speed limit of 55 MPH.

Falcon Highway is an east-west minor arterial roadway having two through lanes (one lane in each direction) with shared turn lanes at the intersections within the study area. Falcon Highway provides a posted speed limit of 55 MPH.

State Highway 94 is an east-west principal arterial roadway having two through lanes (one lane in each direction) with a combination of shared and exclusive turn lanes at the intersection within the study area. The Colorado Department of Transportation (CDOT) categorizes the adjacent segment of State Highway 94 as a Non-Rural Principal Highway (NR-A) and provides a posted speed limit of 65 MPH.

All study intersections operate under a stop-control defined as a roadway intersection where vehicle right-of-way signs.

Comparison of existing roadway cross-sections of State Highway 94 and Falcon Highway to the Engineering Criteria Manual (ECM)<sup>2</sup> concludes that the roadways are well suited to accommodate future regional transportation demands. Pursuant to Section 2.4.4 of the County's ECM, each roadway is envisioned to become a four-lane roadway (two through-lanes in each direction) upon buildout.

Please address that the study area includes all affected intersections per ECM Appendix B.2.3. Discuss why the following intersections were not included in the analysis: Curtis Road / Falcon Highway and Curtis Road / Hwy 94.

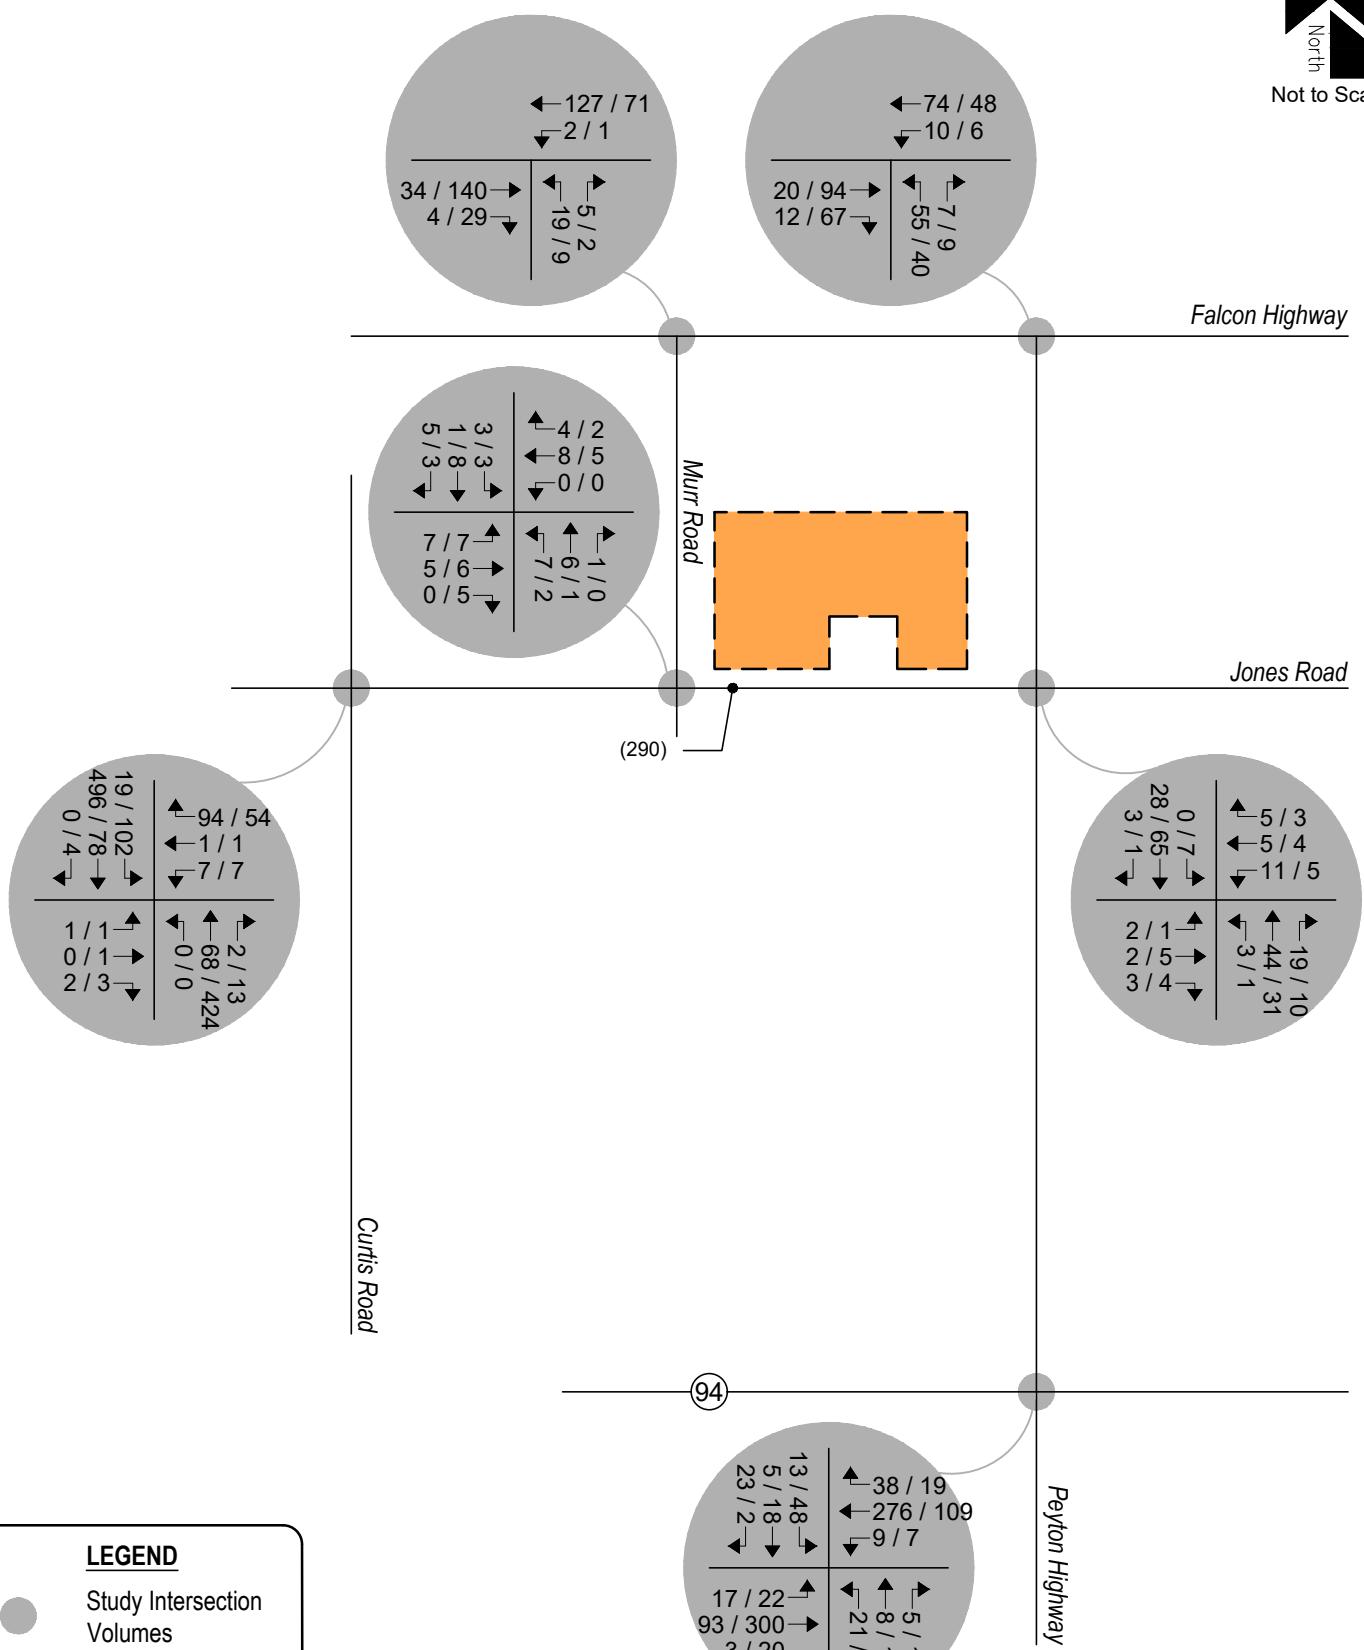

<sup>1</sup> El Paso County 2016 Major Transportation Corridors Plan Update, Felsburg Holt & Ullevig, December 2016.

<sup>2</sup> El Paso County Engineering Criteria Manual, El Paso County, October 2020.

## **II. Existing Traffic Conditions**

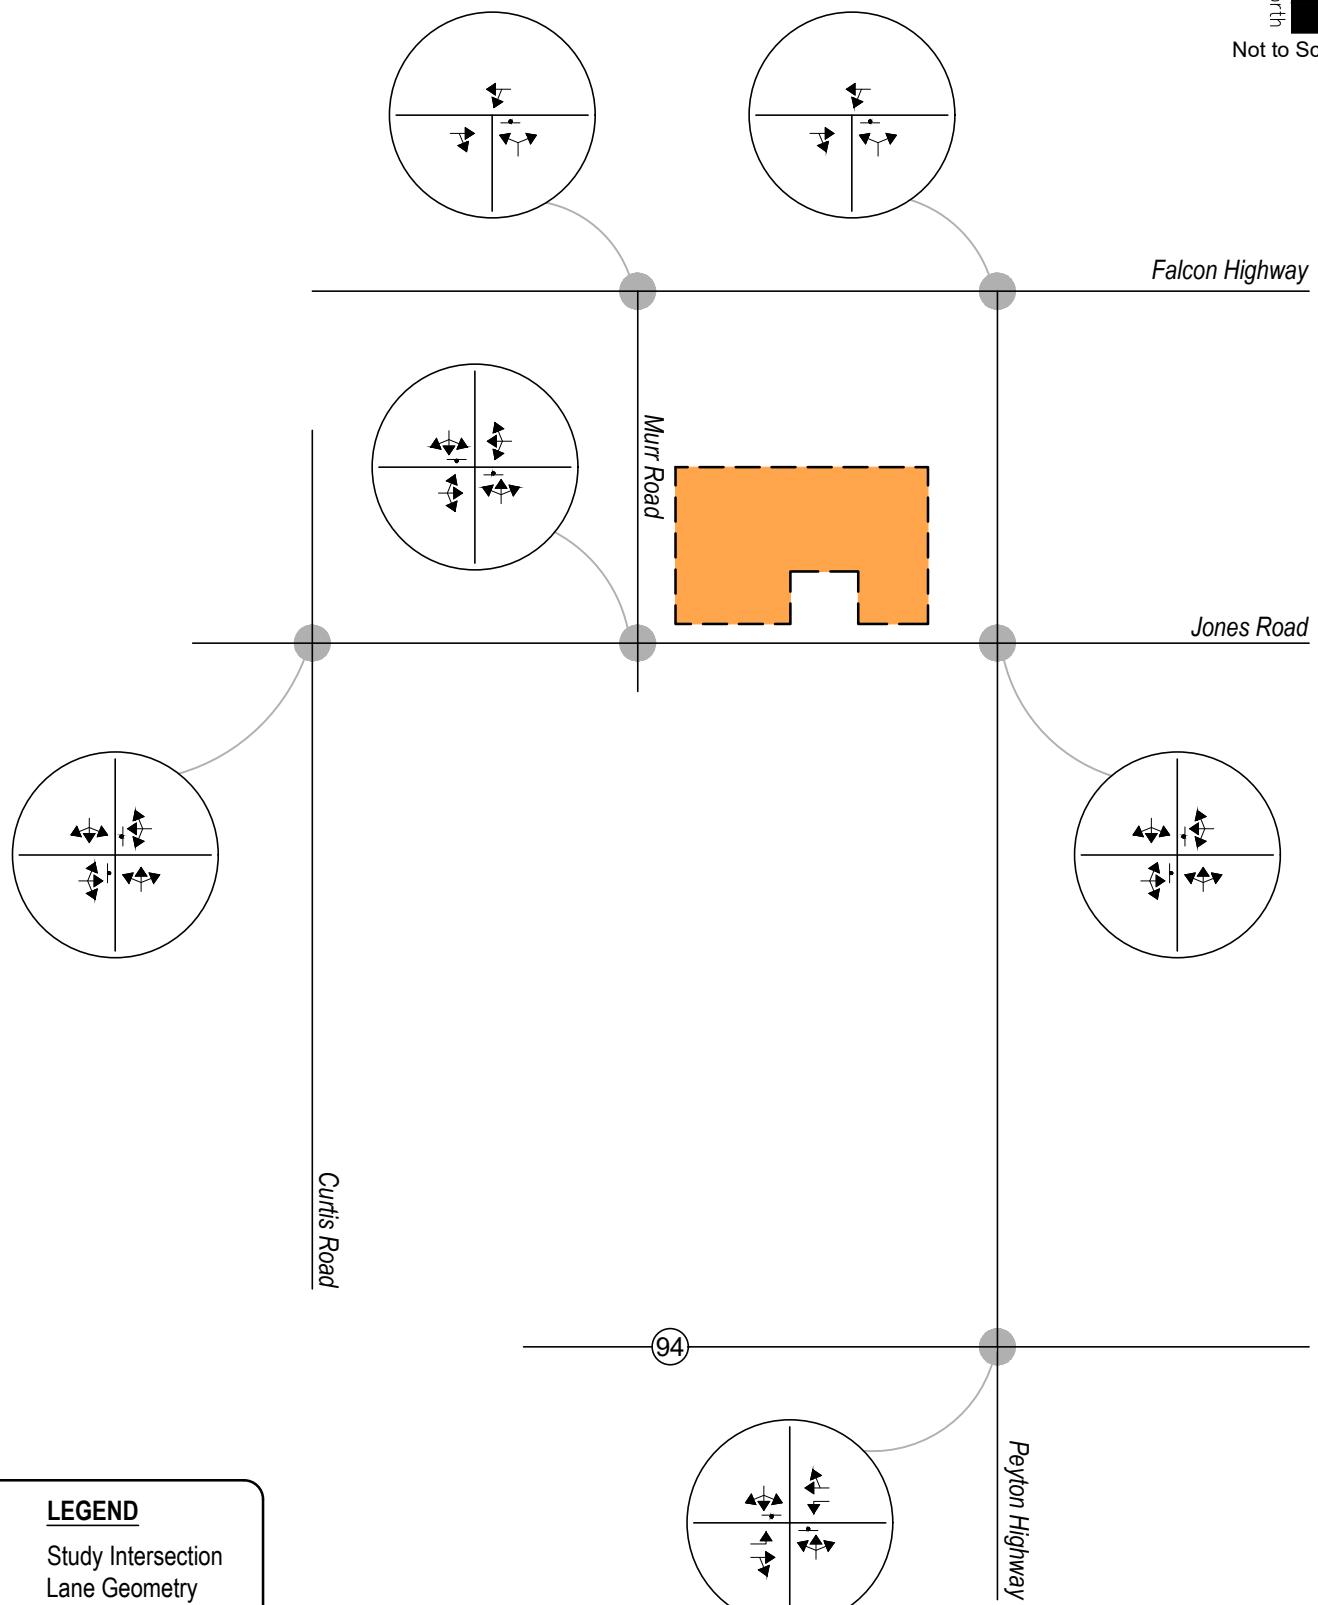

Morning (AM) and afternoon (PM) peak hour traffic counts were collected at the Jones Road intersections with Curtis Road, Murr Road, and Peyton Highway, the Peyton Highway intersections with State Highway 94 and Falcon Highway, and the Falcon Highway intersection with Murr Road. Average daily traffic (ADT) volumes were collected over a 24-hour period on Jones Road. Counts were collected on Tuesday, June 27, 2023, with AM peak hour counts being collected during the period of 7:00 a.m. to 9:00 a.m. and PM peak hour counts being collected during the period of 4:00 p.m. to 6:00 p.m.

Existing traffic volumes are shown on Figure 3. Existing intersection geometry is shown on Figure 3a. Traffic count data is included for reference in Appendix A.

### **Peak Hour Intersection Levels of Service – Existing Traffic**

The Unsignalized Intersection Analysis technique, as published in the Highway Capacity Manual (HCM), 6<sup>th</sup> Edition, by the Transportation Research Board and as incorporated into the SYNCHRO computer program, was used to analyze the study intersections for existing and future traffic conditions. This nationally accepted technique allows for the determination of intersection level of service (LOS) based on the congestion and delay of each traffic movement.

Pursuant to Section B.4.1.A of the County's ECM, the design objective for each scenario of this study shall be level of service "D". Level of service is a method of measurement used by transportation professionals to quantify a driver's perception of travel conditions that include travel time, number of stops, and total amount of stopped delay experienced on a roadway network. The HCM categorizes level of service into a range from "A" which indicates little, if any, vehicle delay, to "F" which indicates a level of operation considered unacceptable to most drivers. These levels of service grades with brief descriptions of the operating condition, for unsignalized and signalized intersections, are included for reference in Appendix B and have been used throughout this study.

The level of service analyses results for existing conditions are summarized in Table 1.

Intersection capacity worksheets developed for this study are provided in Appendix C.

**Table 1 – Intersection Capacity Analysis Summary – Existing Traffic**

INTERSECTION LANE GROUPS	LEVEL OF SERVICE	
	AM PEAK HOUR	PM PEAK HOUR
Falcon Highway / Murr Road (Stop-Controlled) Westbound Left and Through Northbound Left and Right	A A	A A
Falcon Highway / Peyton Highway (Stop-Controlled) Westbound Left and Through Northbound Left and Right	A A	A A
Curtis Road / Jones Road (Stop-Controlled) Eastbound Left, Through, and Right Westbound Left, Through, and Right Northbound Left, Through, and Right Southbound Left, Through, and Right	B A A A	B B A A
Jones Road / Murr Road (Stop-Controlled) Eastbound Left, Through, and Right Westbound Left, Through, and Right Northbound Left, Through, and Right Southbound Left, Through, and Right	A A A A	A A A A
Peyton Highway / Jones Road (Stop-Controlled) Eastbound Left, Through, and Right Westbound Left, Through, and Right Northbound Left, Through, and Right Southbound Left, Through, and Right	A A A A	A A A A
State Highway 94 / Peyton Highway (Stop-Controlled) Eastbound Left Westbound Left Northbound Left, Through, and Right Southbound Left, Through, and Right	A A B B	A A B C

Key: Stop-Controlled Intersection: Level of Service

## Existing Traffic Analysis Results

Under existing conditions, operational analysis shows that the stop-controlled intersections of Falcon Highway with Murr Road and Peyton Highway have turn movement operations at LOS A during the morning and afternoon peak traffic hours.

The stop-controlled intersection of Curtis Road with Jones Road has turn movement operations at LOS B or better during both peak traffic hours.

The stop-controlled intersections of Jones Road with Murr Road and Peyton Highway have turn movement operations at LOS A during both peak traffic hours.

The stop-controlled intersection of State Highway 94 with Peyton Highway has turn movement operations at LOS B or better during the AM peak traffic hour and LOS C or better during the PM peak traffic hour.

### **III. Future Traffic Conditions Without Proposed Development**

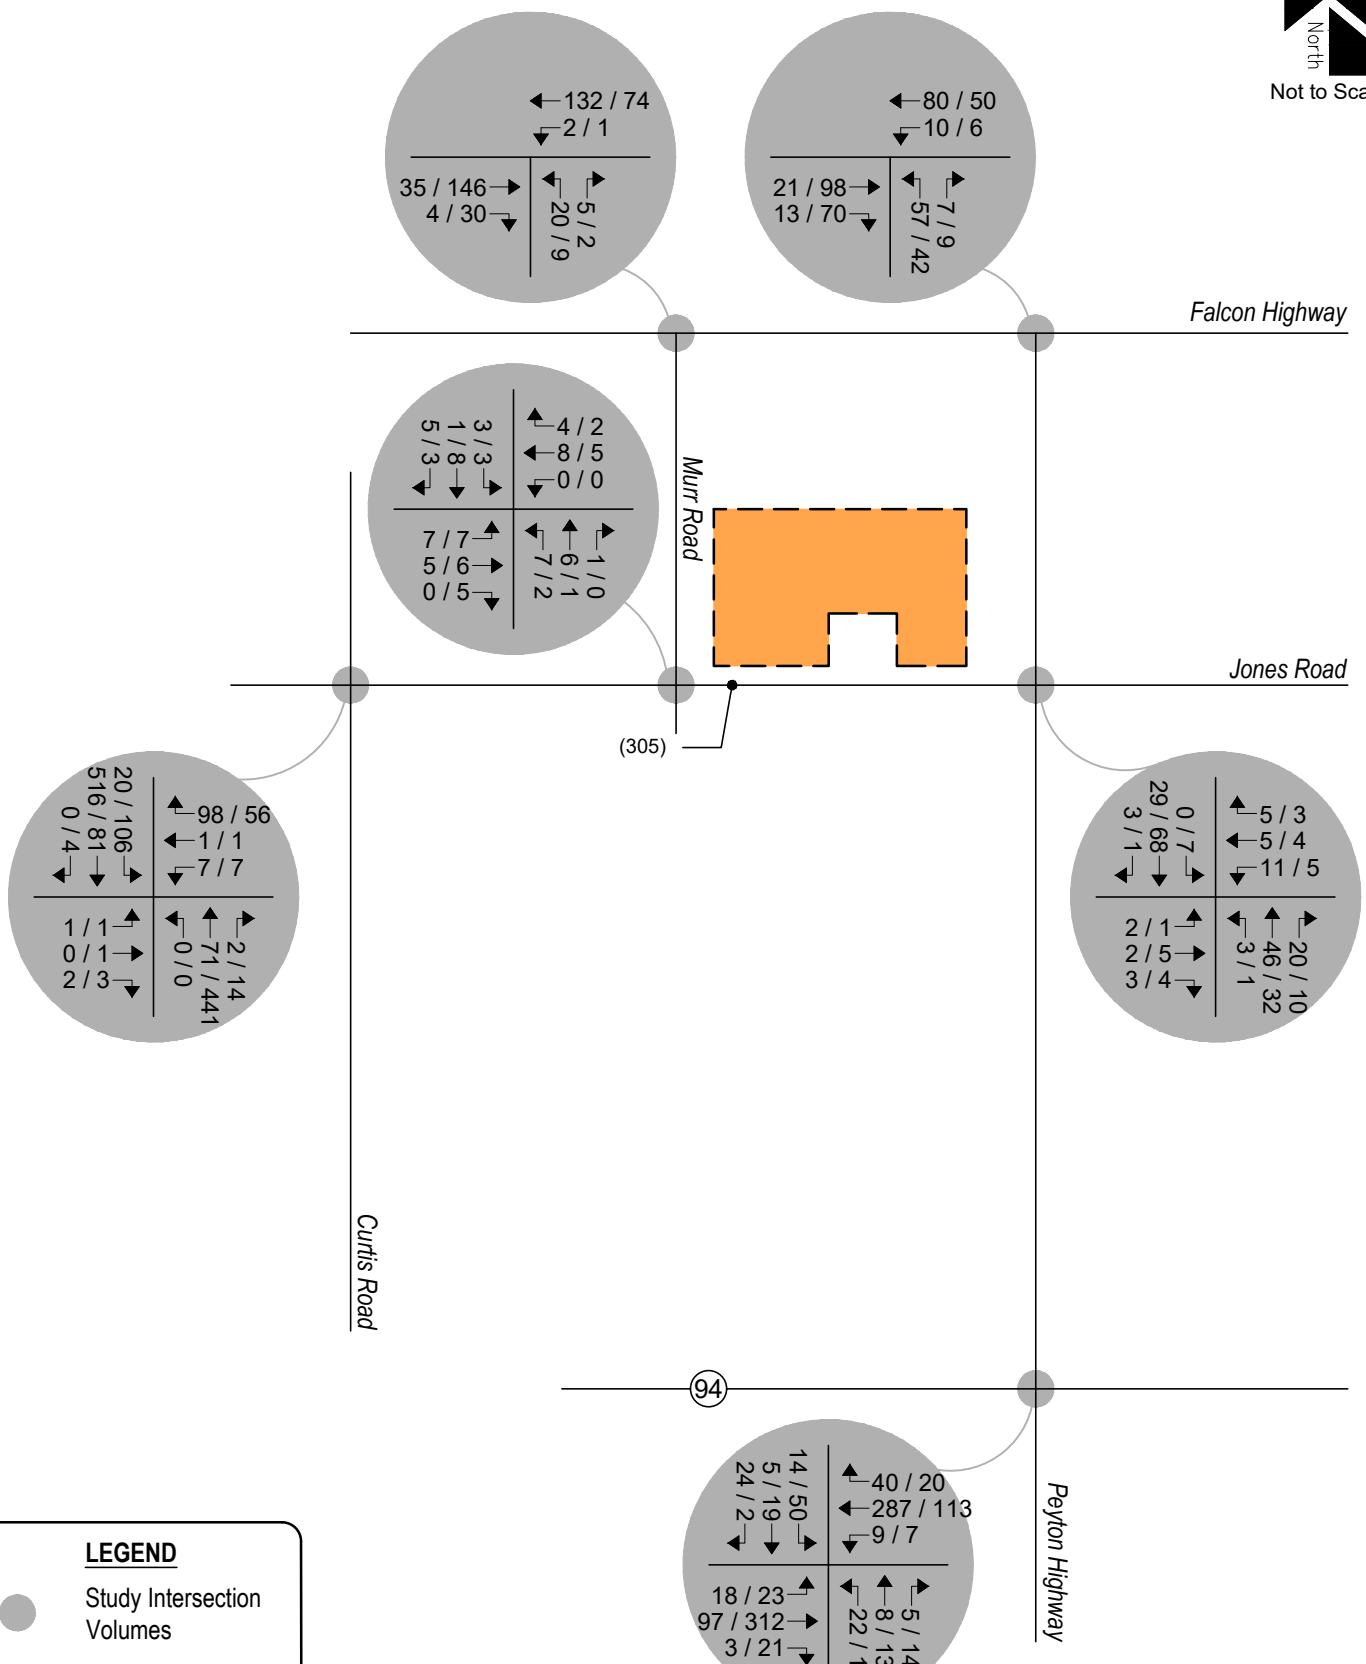

Background traffic is the traffic projected to be on area roadways without consideration of the proposed development. Background traffic includes traffic generated by development of vacant parcels in the area.

To account for projected increases in background traffic for Years 2025 and 2043, a compounded annual growth rate was determined using historical traffic data provided by CDOT's Online Transportation Information System (OTIS) along the adjacent segment of State Highway 94, which anticipates a 20-year growth rate between one and two percent. Therefore, in order to provide for a conservative analysis, a growth rate of two percent was applied to existing traffic volumes. This annual growth rate is also considered to be consistent with regional growth projections and the level of in-fill development expected within the area.

Pursuant to the roadway improvements discussed in Section I, Year 2025 and Year 2043 background traffic conditions assume no roadway improvements to accommodate regional transportation demands. This assumption provides for a conservative analysis.

Projected background traffic volumes and intersection geometry for Year 2025 are shown on Figure 4 and Figure 4a, respectively.

Projected background traffic volumes and intersection geometry for Year 2043 are shown on Figure 5 and Figure 5a, respectively.

### Peak Hour Intersection Levels of Service – Background Traffic

As with existing traffic conditions, the operations of study intersections were analyzed under background conditions, without the proposed development, using the SYNCHRO computer program.

Background traffic level of service analysis results for Year 2025 are listed in Table 2. Year 2043 operational results are summarized in Table 3.

Definitions of levels of service are given in Appendix B. Intersection capacity worksheets are provided in Appendix C.

**Table 2 – Intersection Capacity Analysis Summary – Background Traffic – Year 2025**

INTERSECTION LANE GROUPS	LEVEL OF SERVICE	
	AM PEAK HOUR	PM PEAK HOUR
Falcon Highway / Murr Road (Stop-Controlled) Westbound Left and Through Northbound Left and Right	A A	A A
Falcon Highway / Peyton Highway (Stop-Controlled) Westbound Left and Through Northbound Left and Right	A A	A A
Curtis Road / Jones Road (Stop-Controlled) Eastbound Left, Through, and Right Westbound Left, Through, and Right Northbound Left, Through, and Right Southbound Left, Through, and Right	B A A A	B B A A
Jones Road / Murr Road (Stop-Controlled) Eastbound Left, Through, and Right Westbound Left, Through, and Right Northbound Left, Through, and Right Southbound Left, Through, and Right	A A A A	A A A A

State Highway 94 / Peyton Highway (Stop-Controlled) Eastbound Left Westbound Left Northbound Left, Through, and Right Southbound Left, Through, and Right	A A B B	A A B C

Key: Stop-Controlled Intersection: Level of Service

## Background Traffic Analysis Results – Year 2025

Year 2025 background traffic analysis indicates that the stop-controlled intersections of Falcon Highway with Murr Road and Peyton Highway have turn movement operations at LOS A during the morning and afternoon peak traffic hours.

The stop-controlled intersection of Curtis Road with Jones Road projects turn movement operations at LOS B or better during both peak traffic hours.

The stop-controlled intersections of Jones Road with Murr Road and Peyton Highway expect turn movement operations at LOS A during both peak traffic hours.

The stop-controlled intersection of State Highway 94 with Peyton Highway predicts turn movement operations at LOS B or better during the AM peak traffic hour and LOS C or better during the PM peak traffic hour.

**Table 3 – Intersection Capacity Analysis Summary – Background Traffic – Year 2043**

INTERSECTION LANE GROUPS	LEVEL OF SERVICE	
	AM PEAK HOUR	PM PEAK HOUR
Falcon Highway / Murr Road (Stop-Controlled) Westbound Left and Through Northbound Left and Right	A B	A B
Falcon Highway / Peyton Highway (Stop-Controlled) Westbound Left and Through Northbound Left and Right	A B	A B
Curtis Road / Jones Road (Stop-Controlled) Eastbound Left, Through, and Right Westbound Left, Through, and Right Northbound Left, Through, and Right Southbound Left, Through, and Right	C B A A	C C A A
Jones Road / Murr Road (Stop-Controlled) Eastbound Left, Through, and Right Westbound Left, Through, and Right Northbound Left, Through, and Right Southbound Left, Through, and Right	A A A A	A A A A
Peyton Highway / Jones Road (Stop-Controlled) Eastbound Left, Through, and Right Westbound Left, Through, and Right Northbound Left, Through, and Right Southbound Left, Through, and Right	A A A A	A A A A
State Highway 94 / Peyton Highway (Stop-Controlled) Eastbound Left Westbound Left Northbound Left, Through, and Right Southbound Left, Through, and Right	A A C C	A A C D

Key: Stop-Controlled Intersection: Level of Service

### **Background Traffic Analysis Results – Year 2043**

By Year 2043 and without the proposed development, the stop-controlled intersections of Falcon Highway with Murr Road and Peyton Highway have turn movement operations at LOS B or better during the morning and afternoon peak traffic hours.

The stop-controlled intersection of Curtis Road with Jones Road projects turn movement operations at LOS C or better during both peak traffic hours.

The stop-controlled intersections of Jones Road with Murr Road and Peyton Highway expect turn movement operations at LOS A during both peak traffic hours.

The stop-controlled intersection of State Highway 94 with Peyton Highway predicts turn movement operations at LOS C or better during the AM peak traffic hour and LOS D or better during the PM peak traffic hour.

## IV. Proposed Project Traffic

### Trip Generation

Standard traffic generation characteristics compiled by the Institute of Transportation Engineers (ITE) in their report entitled Trip Generation Manual, 11<sup>th</sup> Edition, were applied to the proposed land use in order to estimate average daily traffic (ADT), AM Peak Hour, and PM Peak Hour vehicle trips. A vehicle trip is defined as a one-way vehicle movement from a point of origin to a point of destination.

The ITE land use code 210 (Single-Family Detached Housing) was used for estimating trip generation because of its conservative rates and best fit to the proposed land use description.

As actual land uses, densities, or site plans become defined over time, it is expected that traffic generation characteristics considered within this study will need to be updated by more specific traffic analyses or studies to help assess if transportation improvements are needed to mitigate potential traffic impacts.

Trip generation rates used in this study are presented in Table 4.

**Table 4 – Trip Generation Rates**

ITE CODE	LAND USE	UNIT	TRIP GENERATION RATES						
			24 HOUR	AM PEAK HOUR			PM PEAK HOUR		
				ENTER	EXIT	TOTAL	ENTER	EXIT	TOTAL
210	Singe-Family Detached Housing	DU	9.43	0.18	0.53	0.70	0.59	0.35	0.94

Key: DU = Dwelling Units.

Note: All data and calculations above are subject to being rounded to nearest value.

Table 5 illustrates projected ADT, AM Peak Hour, and PM Peak Hour traffic volumes likely generated by the proposed development upon build-out.

**Table 5 – Trip Generation Summary**

ITE CODE	LAND USE	SIZE	TOTAL TRIPS GENERATED						
			24 HOUR	AM PEAK HOUR			PM PEAK HOUR		
				ENTER	EXIT	TOTAL	ENTER	EXIT	TOTAL
210	Singe-Family Detached Housing	244 DU	2,301	43	128	171	144	85	229
		Total:	2,301	43	128	171	144	85	229

Key: DU = Dwelling Units.

Note: All data and calculations above are subject to being rounded to nearest value.

Upon build-out, Table 5 illustrates that the proposed development has the potential to generate approximately 2,301 daily vehicle trips with 171 of those occurring during the morning peak hour and 229 during the afternoon peak hour.

### **Adjustments to Trip Generation Rates**

A development of this type is not likely to attract trips from within area land uses nor pass-by or diverted link trips from the adjacent roadway system, therefore no trip reduction was taken in this analysis.

### **Trip Distribution**

The overall directional distribution of site-generated traffic was determined based on the location of the development site within the County, proposed and existing area land uses, allowed turning movements, available roadway network, and in reference to historical traffic count data provided by CDOT's Traffic Count Database System (TCDS)<sup>3</sup>.

Overall trip distribution patterns for the development are shown on Figure 6.

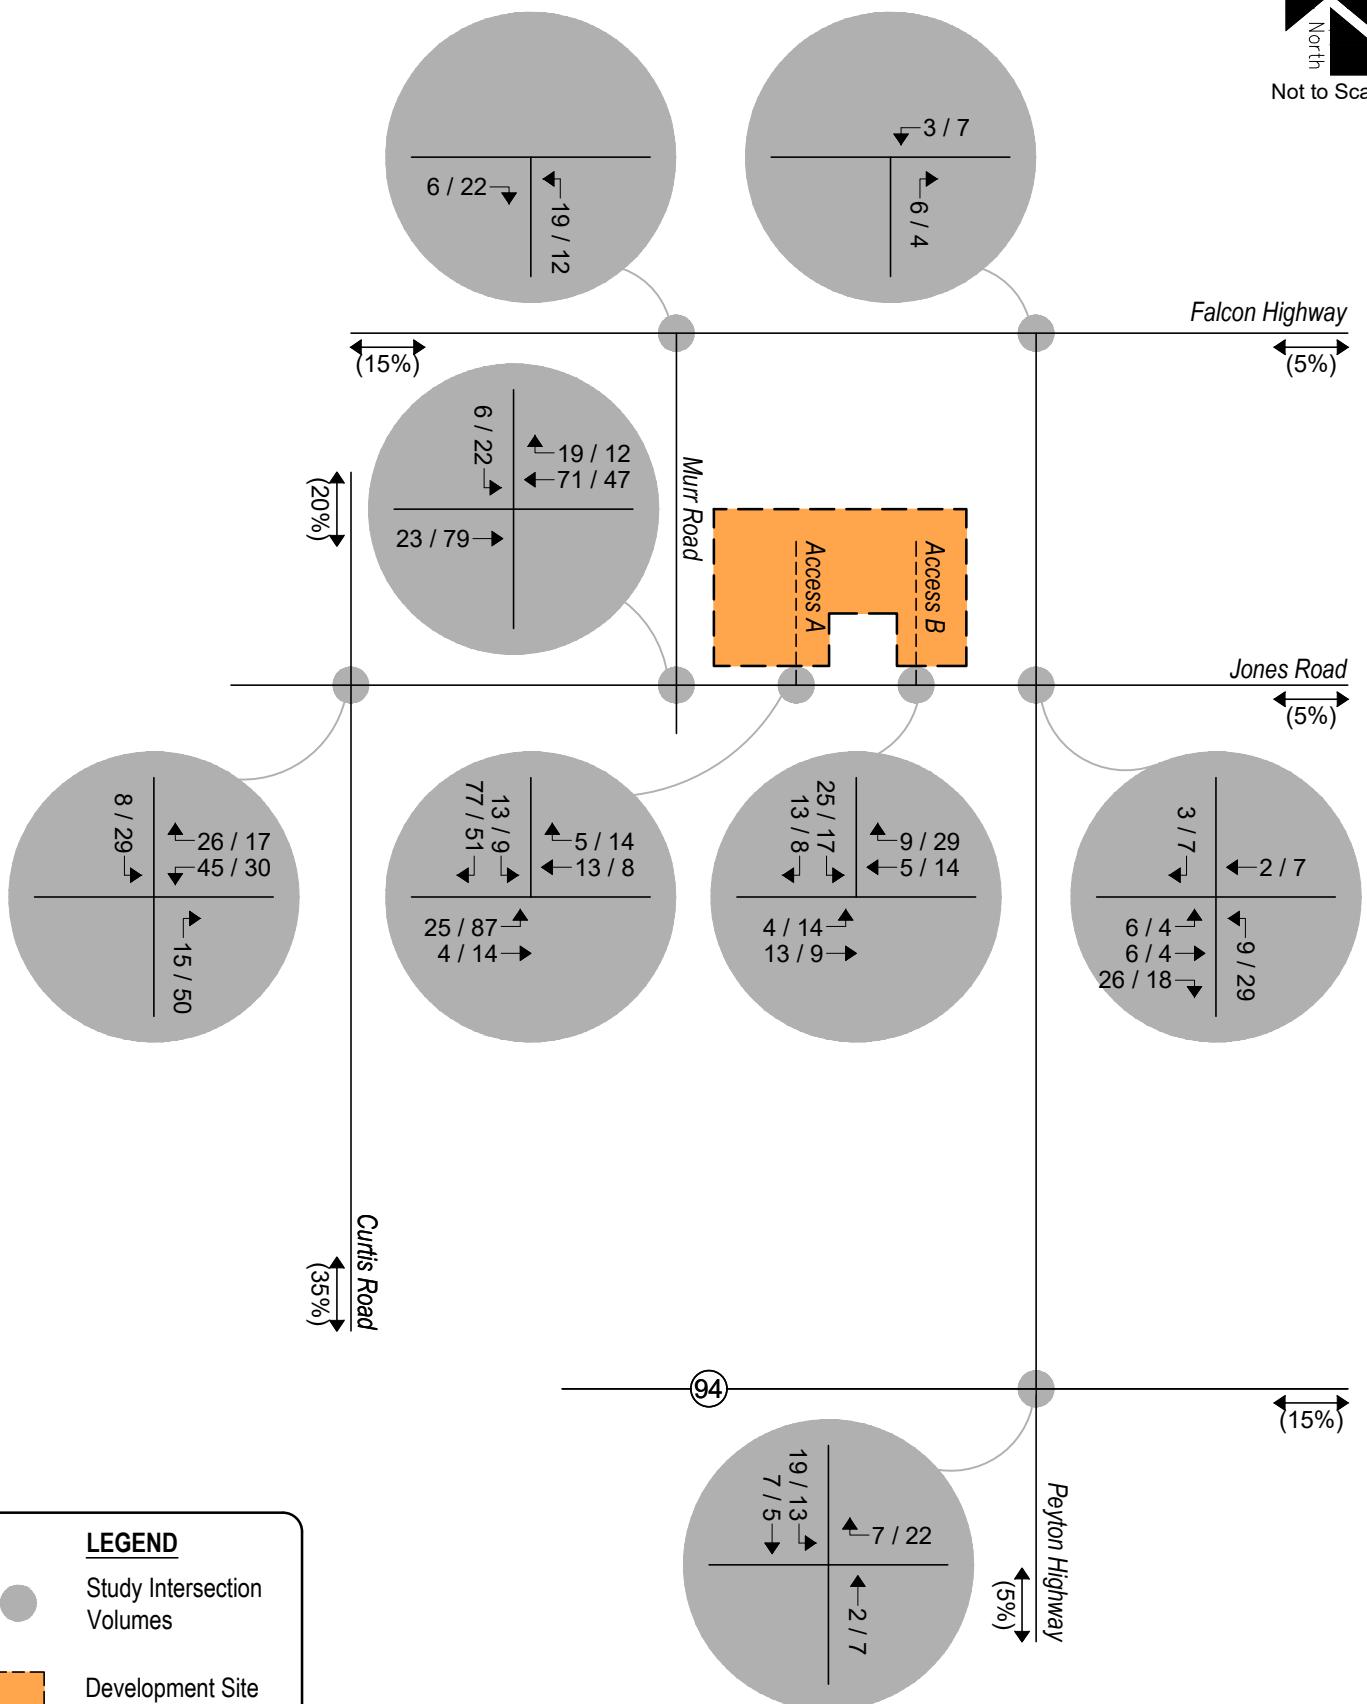

### **Trip Assignment**

Traffic assignment is how generated and distributed vehicle trips are expected to be loaded onto the available roadway network.

Applying trip distribution patterns to site-generated traffic provides the overall site-generated trip assignments shown on Figure 6.

---

<sup>3</sup> Transportation Data Management System, MS2, 2022.

**Figure 6**  
**SITE DEVELOPMENT DISTRIBUTION (%) : Overall**  
**SITE-GENERATED AM / PM Peak Hour**

## V. Future Traffic Conditions With Proposed Developments

Total traffic is the traffic projected to be on area roadways with consideration of the proposed development. Total traffic includes background traffic projections for Years 2025 and 2043 with consideration of site-generated traffic. For analysis purposes, it was assumed that development construction would be completed by end of Year 2025.

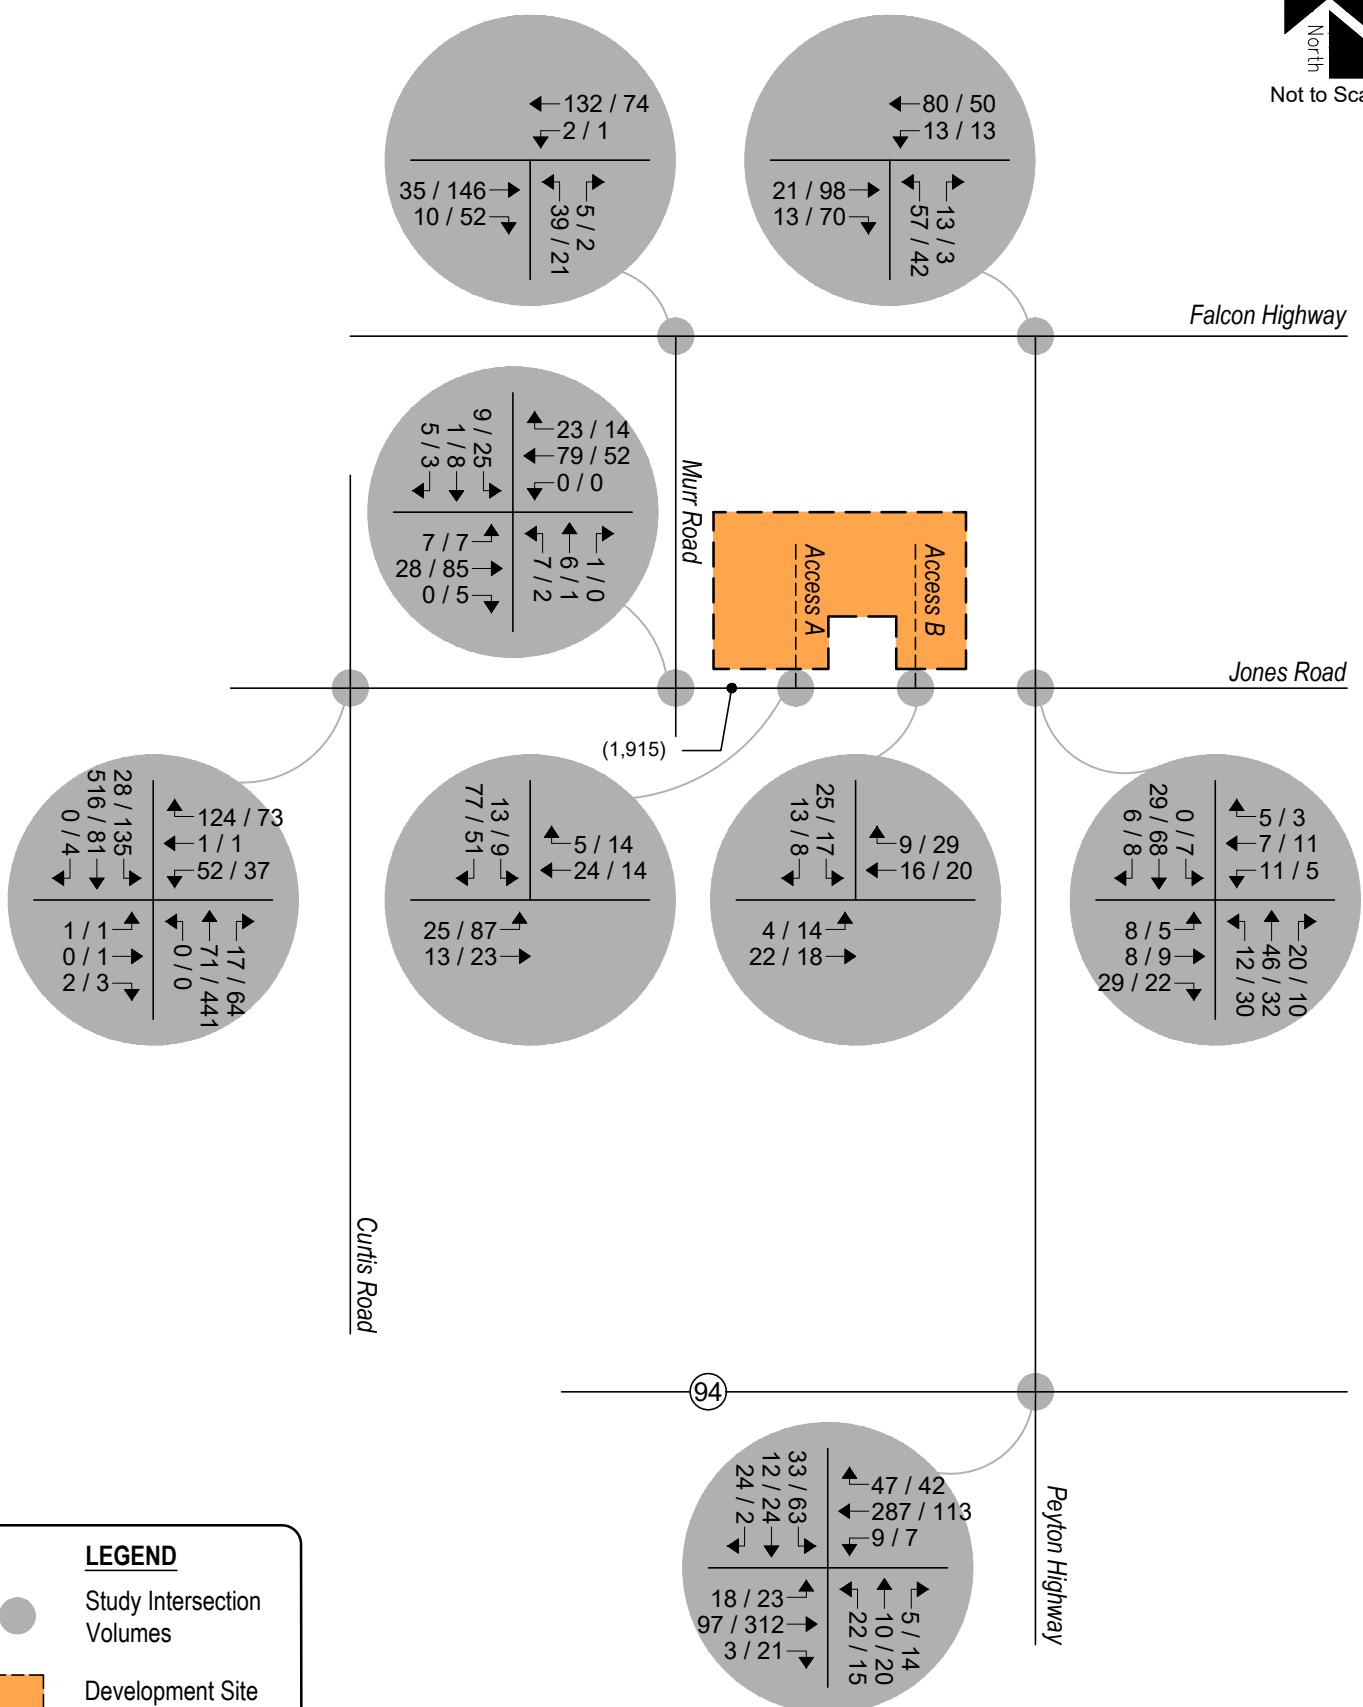

Pursuant to area roadway improvement discussions provided in Section III, Year 2025 and Year 2043 total traffic conditions assume no roadway improvements to accommodate regional transportation demands. Roadway improvements associated with site development are expected to be limited to site access and frontage as required by the governing agency.

Projected Year 2025 total traffic volumes and intersection geometry are shown in Figure 7 and Figure 7a, respectively.

Figure 8 and Figure 8a shows projected total traffic volumes and intersection geometry for Year 2043, respectively.

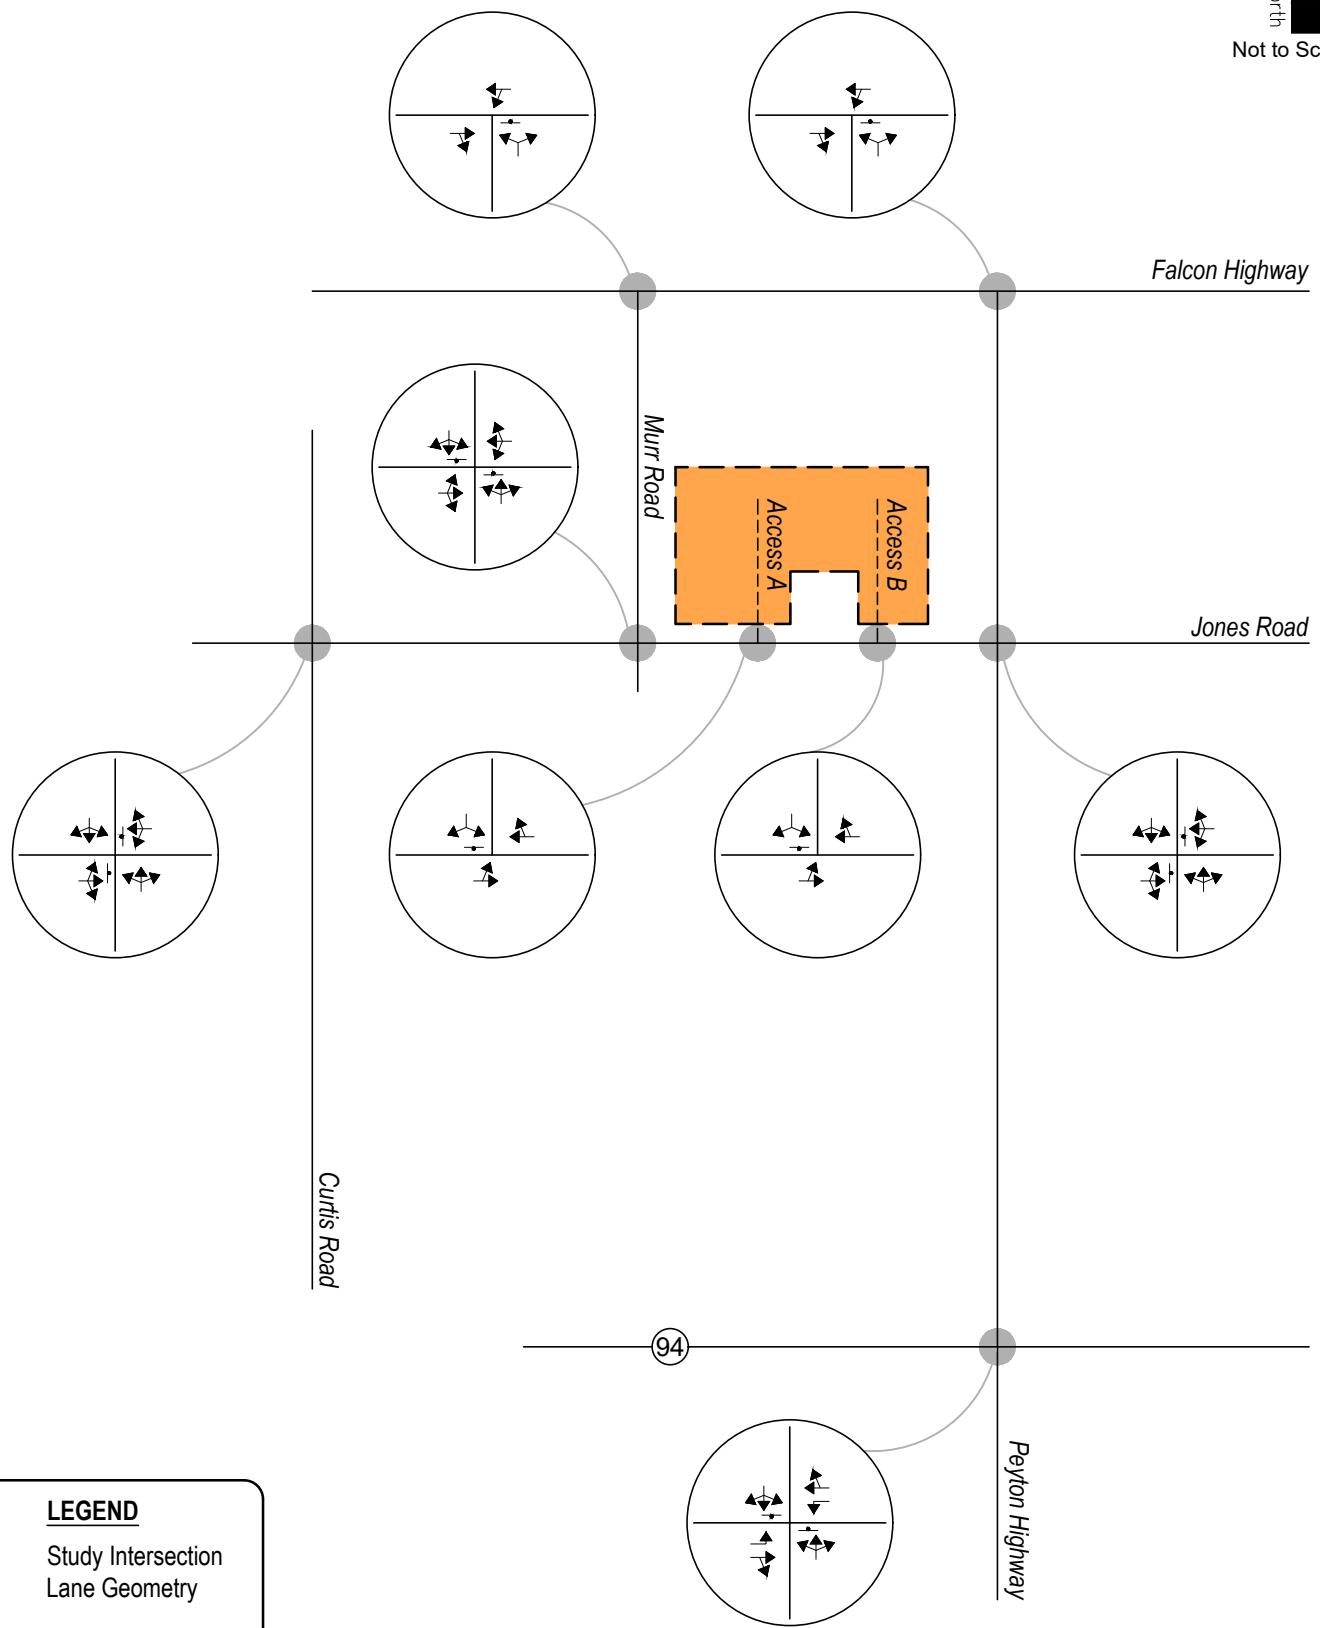

Please address right of way  
preservation shown on the  
concept figure.

Please discuss whether the the turning movements exceed  
the ECM threshold for auxiliary turn lanes based on traffic  
volume.

## VI. Project Impacts

The analyses and procedures described in this study were performed in accordance with the latest HCM and are based upon the worst-case conditions that occur during a typical weekday upon build-out of site development and analyzed land uses. Therefore, study intersections are likely to operate with traffic conditions better than those described within this study, which represent the peak hours of weekday operations only.

### Peak Hour Intersection Levels of Service – Total Traffic

As with background traffic, the operations of the study intersections were analyzed under projected total traffic conditions using the SYNCHRO computer program. Total traffic level of service analysis results for Years 2025 and 2043 are summarized in Table 6 and Table 7, respectively.

Definitions of levels of service are given in Appendix B. Intersection capacity worksheets are provided in Appendix C.

**Table 6 – Intersection Capacity Analysis Summary – Total Traffic – Year 2025**

Key: Stop-Controlled Intersection: Level of Service

### Total Traffic Analysis Results Upon Development Build-Out

Table 7 illustrates how, by Year 2043 and upon development build-out, the stop-controlled intersections of Falcon Highway with Murr Road and Peyton Highway have turn movement operations at LOS B or better during the morning and afternoon peak traffic hours.

The stop-controlled intersection of Curtis Road with Jones Road projects turn movement operations at LOS C or better during both peak traffic hours. Exceptions would include the westbound turning movements which operate at LOS E during the PM peak traffic hour. The LOS E operation is attributed to the through traffic volume along Curtis Road and the stop-controlled nature of the intersection.

The stop-controlled intersections of Jones Road with Murr Road and Peyton Highway expect turn movement operations at LOS A during the AM peak traffic hour and LOS B or better during the PM peak traffic hour.

The stop-controlled intersection of State Highway 94 with Peyton Highway predicts turn movement operations at LOS C or better during the AM peak traffic hour and LOS D or better during the PM peak traffic hour.

The stop-controlled intersections of Access A and Access B with Jones Road project turn movement operations at LOS A during both peak traffic hours.

It is to be noted that it is not uncommon for unsignalized movements to or from an arterial roadway, in urban areas, to operate with noticeable delays during peak traffic hours. It is, however, likely that turn movements will operate better than the results obtained with this HCM Two-Way Stop-Control (TWSC) level of service analysis would indicate, as the HCM analysis may not accurately account for the effect of vehicle platooning and gaps caused by upstream signals. The upstream signal control on Curtis Road will tend to create additional gaps in the traffic stream for turning movements at Jones Road and will most likely provide mitigation to the LOS E operation projected during the PM peak traffic hour.

Compared to the background traffic analysis, the traffic generated by the proposed development is not expected to significantly change the operations of the study intersections. These intersection operations are similar to background conditions.

#### Pedestrian Circulation & Safety Analysis

Comparing Background Traffic to Total Traffic, the LOS will be significantly impacted by the proposed development.

In accordance with Section B.2.4.B of the County's ECM, an assessment to pedestrian connectivity and safety was considered.

Due to the conceptual nature of the site plan, it is unknown at this time how the proposed development would accommodate pedestrians and bicyclists.

With the assumption that future site plans are designed per the County's ECM, and pursuant to the Federal Highway Administration's (FHWA) Guide for Improving Pedestrian Safety at Uncontrolled Crossing Locations<sup>4</sup>, pedestrian safety is not expected to be of concern. Moreover, traffic calming and pedestrian crossing treatments are not applicable, and traffic calming is not recommended for the proposed conditions.

---

<sup>4</sup> [Guide for Improving Pedestrian Safety at Uncontrolled Crossing Locations](#), Federal Highway Administration, July 2018.

## VII. Conclusion

This traffic impact study addressed the capacity, geometric, and control requirements associated with the development entitled Jones Road Property. This proposed residential development consists of a single-family home community on approximately 753 acres of land. The development is located north of Jones Road and east of Murr Road in El Paso County, Colorado.

The study area examined in this analysis encompassed the Jones Road intersections with Curtis Road, Murr Road, and Peyton Highway, the Peyton Highway intersections with State Highway 94 and Falcon Highway, the Falcon Highway intersection with Murr Road, and includes site access drives.

Analysis was conducted for critical AM Peak Hour and PM Peak Hour traffic operations for existing traffic conditions, Year 2025 and Year 2043 background traffic conditions, and Year 2025 and Year 2043 total traffic conditions.

Analysis of existing traffic conditions indicates that the stop-controlled intersections of Falcon Highway with Murr Road and Peyton Highway have turn movement operations at LOS A during the morning and afternoon peak traffic hours. The stop-controlled intersection of Curtis Road with Jones Road has turn movement operations at LOS B or better during both peak traffic hours. The stop-controlled intersections of Jones Road with Murr Road and Peyton Highway have turn movement operations at LOS A during both peak traffic hours. The stop-controlled intersection of State Highway 94 with Peyton Highway has turn movement operations at LOS B or better during the AM peak traffic hour and LOS C or better during the PM peak traffic hour.

Without the proposed development, Year 2025 background operational analysis shows that the stop-controlled intersections of Falcon Highway with Murr Road and Peyton Highway have turn movement operations at LOS A during the morning and afternoon peak traffic hours. The stop-controlled intersection of Curtis Road with Jones Road projects turn movement operations at LOS B or better during both peak traffic hours. The stop-controlled intersections of Jones Road with Murr Road and Peyton Highway expect turn movement operations at LOS A during both peak traffic hours. The stop-controlled intersection of State Highway 94 with Peyton Highway predicts turn movement operations at LOS B or better during the AM peak traffic hour and LOS C or better during the PM peak traffic hour.

By Year 2043 and without the proposed development, the stop-controlled intersections of Falcon Highway with Murr Road and Peyton Highway have turn movement operations at LOS B or better during the morning and afternoon peak traffic hours. The stop-controlled intersection of Curtis Road with Jones Road projects turn movement operations at LOS C or better during both peak traffic hours. The stop-controlled intersections of Jones Road with Murr Road and Peyton Highway expect turn movement operations at LOS A during both peak traffic hours. The stop-controlled intersection of State Highway 94 with Peyton Highway predicts turn movement operations at LOS C or better during the AM peak traffic hour and LOS D or better during the PM peak traffic hour.

**Analysis of future traffic conditions indicates that the addition of site-generated traffic is expected to create minimal negative impact to traffic operations for the existing and surrounding roadway system.** With all conservative assumptions defined in this analysis, the study intersections are projected to operate at future levels of service comparable to Year 2043 background traffic conditions. Proposed site accesses have long-term operations at LOS A during peak traffic periods and upon build-out.

The letter of intent includes recommended roadway and intersection improvement tables. Include those tables and discussion in the TIS.

Or remove reference to tables in Letter of Intent

Address Road Impact Fees and selected payment option. State if any of the proposed improvements are shown in the 2024 MTCP.

Include discussion on safety and crash analysis.

## APPENDIX A

### Traffic Count Data

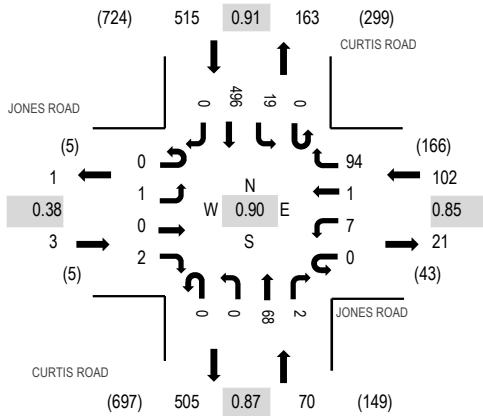

**Location:** 1 CURTIS ROAD & JONES ROAD AM

**Date:** Tuesday, June 27, 2023

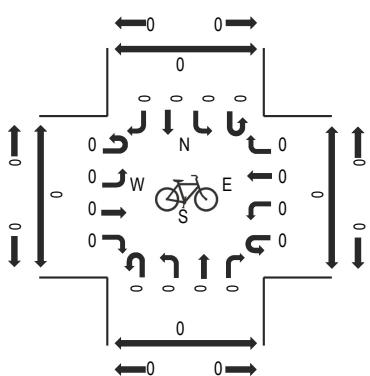

**Peak Hour:** 07:00 AM - 08:00 AM

**Peak 15-Minutes:** 07:15 AM - 07:30 AM

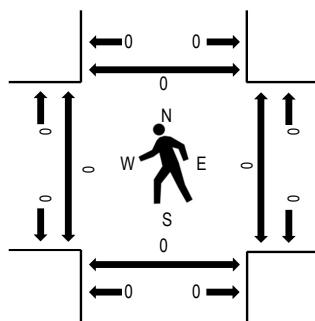

### Peak Hour - Motorized Vehicles

### Peak Hour - Bicycles

### Peak Hour - Pedestrians

**APPENDIX B**

**Level of Service Definitions**

The following information is referenced from the [Highway Capacity Manual: A Guide for Multimodal Mobility Analysis](#), 6<sup>th</sup> Edition, Transportation Research Board, 2016: Chapter 19 – Signalized Intersections.

### **Motorized Vehicle Level of Service (LOS) for Signalized Intersections**

Levels of service are defined to represent reasonable ranges in control delay.

**LOS A** Describes operations with a control delay of 10 s/veh or less and a volume-to-capacity ratio no greater than 1.0. This level is typically assigned when the volume-to-capacity ratio is low and either progression is exceptionally favorable or the cycle length is very short. If it is due to favorable progression, most vehicles arrive during the green indication and travel through the intersection without stopping.

**LOS B** Describes operations with control delay between 10 and 20 s/veh and a volume-to-capacity ratio no greater than 1.0. This level is typically assigned when the volume-to-capacity ratio is low and either progression is highly favorable or the cycle length is short. More vehicles stop than with LOS A.

**LOS C** Describes operations with control delay between 20 and 35 s/veh and a volume-to-capacity ratio no greater than 1.0. This level is typically assigned when progression is favorable or the cycle length is moderate. Individual *cycle failures* (i.e., one or more queued vehicles are not able to depart as a result of insufficient capacity during the cycle) may begin to appear at this level. The number of vehicles stopping is significant, although many vehicles still pass through the intersection without stopping.

**LOS D** Describes operations with control delay between 35 and 55 s/veh and a volume-to-capacity ratio no greater than 1.0. This level is typically assigned when the volume-to-capacity ratio is high and either progression is ineffective or the cycle length is long. Many vehicles stop and individual cycle failures are noticeable.

**LOS E** Describes operations with control delay between 55 and 80 s/veh and a volume-to-capacity ratio no greater than 1.0. This level is typically assigned when the volume-to-capacity ratio is high, progression is unfavorable, and the cycle length is long. Individual cycle failures are frequent.

**LOS F** Describes operations with control delay exceeding 80 s/veh or a volume-to-capacity ratio greater than 1.0. This level is typically assigned when the volume-to-capacity ratio is very high, progression is very poor, and the cycle length is long. Most cycles fail to clear the queue.

Control Delay (s/veh)	<u>LOS by Volume-to-Capacity Ratio<sup>a</sup></u>	
	v/c ≤ 1.0	v/c > 1.0
≤ 10	A	F
> 10 – 20	B	F
> 20 – 35	C	F
> 35 – 55	D	F
> 55 – 80	E	F
> 80	F	F

Note: <sup>a</sup>For approach-based and intersectionwide assessments, LOS is defined solely by control delay.

The following information is referenced from the [Highway Capacity Manual: A Guide for Multimodal Mobility Analysis](#), 6<sup>th</sup> Edition, Transportation Research Board, 2016: Chapter 20 – Two-Way Stop-Controlled Intersections, Chapter 21 – All-Way Stop-Controlled Intersections, and Chapter 22 - Roundabouts.

### **Motorized Vehicle Level of Service (LOS) for Unsignalized & Roundabout Intersections**

LOS is a quantitative stratification of performance measure(s) representing quality of service. Quality of service describes how well a transportation facility or service operates from a traveler's perspective. LOS is measured on an A – F scale, with LOS A representing the best operating conditions from a traveler's perspective.

Control Delay (s/veh)	<u>LOS by Volume-to-Capacity Ratio<sup>a</sup></u>	
	v/c ≤ 1.0	v/c > 1.0
0 – 10	A	F
> 10 – 15	B	F
> 15 – 25	C	F
> 25 – 35	D	F
> 35 – 50	E	F
> 50	F	F

Note: The LOS criteria apply to each lane on a given approach and to each approach on the minor street. LOS is not calculated for major-street approaches or for the intersection as a whole.

<sup>a</sup>For approaches and intersectionwide assessment, LOS is defined solely by control delay.
