Drainage Plan: Map(s) of the proposed development at a scale of 1"=20' to 1"=200' shall be included to identify existing and proposed conditions on or adjacent to the site in question. It shall include a minimum of:
Existing and proposed contours at 2 feet maximum intervals. For subdivisions involving rural lots greater than 1.0 acre, the maximum interval may be 5 feet where approved. In terrain greater than 10% the intervals should be 10 foot intervals.
Property lines and existing or proposed easements with purposes noted.
All Streets
Existing drainage facilities and structures, including irrigation ditches roadside ditches, drainageways, gutters and culverts, all indicating flow direction. All pertinent information such as material, size, shape, slope and locations shall also be included.
Overall drainage area boundary and drainage sub-area boundaries relating to the subdivision.
Proposed type of street sections (i.e., vertical or ramp curb and gutters, roadside ditch, gutter flow and/or cross pans).
Proposed storm sewers and open drainageways, including inlets, manholes, culverts, and other appurtenances.
Proposed outfall point for runoff from the developed area and facilities to convey flows to the final outfall point without damage to downstream properties.
Routing and summary of initial and major flow rates at various design points for all storm runoff associated with the property.
Path (s) chosen for computation of time of concentration.
Details of and design computations for detention storage facilities including outlet.
Location and elevations of all defined 100-year floodplains affecting the property.
Location of all existing and proposed utilities affected by or affecting the drainage design.

Fox Run Substation Drainage Report

TRI-STATE GENERATION & TRANSMISSION, INC.

FOX RUN SUBSTATION
DRAINAGE REPORT

ENGINEER'S CERTIFICATION

I hereby certify that this drainage report for the drainage design of the Fox Run Substation was prepared by me (or under my direct supervision) in accordance with the common engineering practices for the owners thereof. I understand that El Paso County does not and will not assume liability for drainage facilities designed by others, including the designs presented in this report.

Registered Professional Engineer
State of Colorado No. 47195

Include page for standard signature blocks for Drainage Reports See paperclip pg 2

TABLE OF CONTENTS

Submit Appdx B GEOTECH report as a separate document and reference in the drainage report

1.0   General Location and Description

Tri-State Generation and Transmission (TSGT) in coordination with Del-Mont Consultants, Inc. (DMC) is in the process of designing a new substation yard. The scope of work includes the construction of the substation yard & retaining walls, driveway, detention pond and swales, installation of new perimeter fence, and the addition of high voltage electrical equipment and facilities. The purpose of this report is to present the findings from the hydrologic and hydraulic analyses that were performed on the existing property as well as present the results from a detailed analysis performed on the proposed improvements to the property.

1.1   Site Location

The proposed substation yard is located on a 14.92-acre parcel owned by TSGT, situated in the NW ¼ of Section 21, Township 11 South, Range 66 West, 6th Principal Meridian in El Paso County, Colorado. The substation site is accessed from Shahara Road.

1.2   Site Description

The site naturally drains to the northeast and is currently covered in various grasses. There are currently no features on the site to provide water quality or quantity treatment for discharge from the site. Site layout details will be discussed in more detail in **Section 2**.

There are developments on the properties to the south and the west of the site. MVEA Substation located on the neighboring property to the south, and Jackson Ranch Subdivision to the west. No wetlands are present on the site and the site is not located within a floodplain.

2.0   Drainage Basins and Sub-Basins

The property functions overall as one large basin, flowing to the northeast into a drainage on the east edge of the property. Proposed conditions produce several smaller sub-basins and will be discussed in detail in the following sections.

2.1   Existing Drainage Sub-Basins

The existing site was analyzed as one basin. A small portion of the existing site was unanalyzed as it did not affect the majority of the site. A map illustrating the delineation of the existing property can be found in **Appendix A**. There are developments on the properties to the south and the west of the site. MVEA Substation located on the neighboring property to the south, and Jackson Ranch Subdivision to the west. **Table 2-1** presents the existing basin and its corresponding acreage. The existing member substation was not analyzed as a part of this project.

Table 2-1: Existing Basin Acreages

Sub-Basin	Total Area (Acres)
Existing	14.38
Unanalyzed	0.54

2.2   Proposed Drainage Sub-Basins

The proposed conditions will produce several different sub-basins. The proposed site is divided into three different sub-basins; Yard Area, Proposed North, and Proposed South. A map illustrating the delineation of the sub-basins can be found in **Appendix A**. The Yard Area contains the entirety of the yard and the detention pond. The Proposed North and Proposed South areas contain swales that will route any run-on around the substation site, returning to historical discharge patterns. **Table 2-2** presents the proposed sub-basins and their corresponding acreages.

Table 2-2: Proposed Sub-Basin Acreages

Sub-Basin	Total Area (Acres)
Yard Area	5.23
Proposed North	6.70
Proposed South	2.44

3.0 Drainage Design Criteria

3.1 Methodology

The El Paso County Drainage Criteria Manual calls for use of the rational method on sites under 100 acres. However, in the Volume One Update, Chapter 6, 1.4, the EPA SWMM method is noted to be better suited to more complex systems. Due to the complex nature of the drainage system, the hydrologic/hydraulic analysis of the site was performed using the Autodesk Storm and Sanitary analysis utilizing the SWMM engine platform model for a 10-year, 24-hour rainfall event of 3.01 total inches and a 100-year, 24-hour rainfall event of 5.15 total inches. The Curve Number method of determining rainfall losses due to infiltration was used. Runoff for all site conditions was computed for both the 10-year and 100-year, 24-hour storms. Rainfall depths were obtained for the region from NOAA Atlas 14, Volume 8, Version 2 and rainfall distribution curves were developed using a 24-hour rainfall distribution. Modeling results are presented in **Appendix D**.

The Mile High Flood District *Detention Basin Design Workbook* was utilized to determine the required water quality capture volume (WQCV) and to aid in the design the outlet structure. The spreadsheets/worksheets can be found in **Appendix C** and are discussed in more detail in **Section 4.0**.

Soil data was obtained from a USDA Soils Report and gives a hydrologic soil group B for the site. The soils report is included in **Appendix B**.

The described methods/tools used in the analysis, are in accordance with common engineering practices and guidelines.

3.2 Land Cover Hydrologic Properties

Curve numbers and corresponding Manning's N values, for hydrologic soil group B, were assigned to the various land cover types found on the project, both existing and proposed, and are presented in **Table 3-1**.

Table 3-1: Land Cover Hydrologic Properties

Land Cover Type	Curve Number	Manning's N
Pasture or Range Land, Poor Condition (Existing Site)	69	0.15
Open Graded Aggregate Topping Over Compacted Base (Yard)	85	0.024
Compacted Base Material (Driveways)	85	0.024
Pavement/Concrete	98	0.015

3.3 Weighted Design Values

Utilizing the land cover hydrologic properties presented above, a weighted curve number and Manning's N value was calculated for each of the sub-basins, presented in **Section 2.0** to be used for analysis. **Table 3-2** presents the weighted design values for existing

DMC   Fox Run Substation Drainage Report
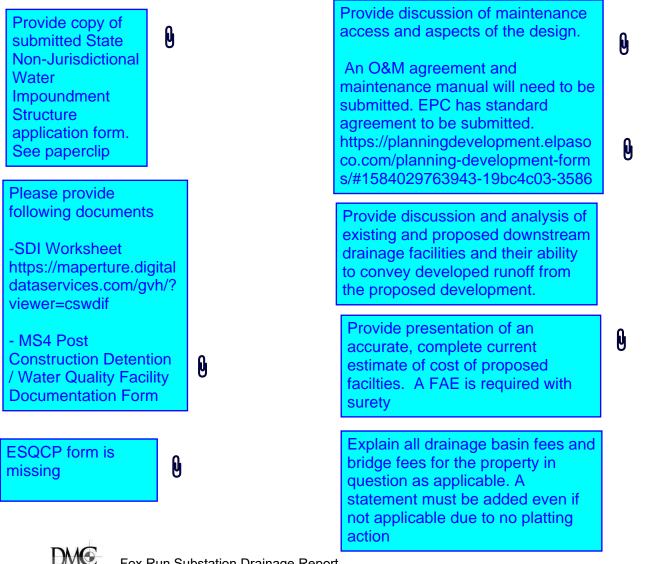

conditions and **Table 3-3** presents the weighted design values for proposed conditions. Detailed calculations can be found in **Appendix C**.

Table 3-2: Existing Sub-Basin Weighted Design Values

Sub-Basin	Total Area (Acres)	Weighted Manning's N	Weighted Curve Number
Existing	14.38	0.150	69

Table 3-3: Proposed Sub-Basin Weighted Design Values

Sub-Basin	Total Area (Acres)	Weighted Manning's N	Weighted Curve Number
Yard Area	5.23	0.058	84.59
Proposed North	6.70	0.15	69
Proposed South	2.44	0.146	69.52

ESQCP form is missing

Provide discussion of maintenance access and aspects of the design.

An O&M agreement and maintenance manual will need to be submitted. EPC has standard agreement to be submitted. https://planningdevelopment.elpaso co.com/planning-development-form s/#1584029763943-19bc4c03-3586

Provide discussion and analysis of existing and proposed downstream drainage facilities and their ability to convey developed runoff from the proposed development.

Provide presentation of an accurate, complete current estimate of cost of proposed facilties. A FAE is required with surety

Explain all drainage basin fees and bridge fees for the property in question as applicable. A statement must be added even if not applicable due to no platting action

DMC Fox Run Substation Drainage Report

4.0 Drainage Facility Design

4.1 Historical Drainage

Per common practice, the 100-year historical discharge value for the site shall be used to determine the allowable discharge from the site for the proposed conditions. Values presented in **Table 3-2** were used in the model to calculate a historic[ ] existing property. **Table 4-1** presents the discharge rate for the existi[ ] 10-year and 100-year 24-hour storm events although the design is b[ ] discharge values.

Table 4-1: Existing Property Discharge Values

Sub-Basin	10-Year Discharge (CFS)	100-Year Discharge (CFS)
Existing	20.08	53.82

Be advise County only requires minor storm to be analyzed with the 5-year design storm. Provide a statement to explain why you elect to design to the 10-yr storm.

4.2 Proposed Drainage

Values presented in **Table 3-3** were utilized in the model to calculate the runoff for the proposed conditions. The Mile High Flood District *Detention Basin Design Workbook* was utilized to determine the WQCV in conjunction with the model to size the detention pond. Once the pond was sized, the Mile High Flood District *Detention Basin Design Workbook* was utilized to estimate required orifice sizes in the outlet structure to provide water quality treatment. The model was then used to verify all design elements of the pond and the outlet structure to ensure the pond not only retained the correct WQCV but to also discharge at or less than the required 100-year historic discharge rate presented in **Table 4-1** as well as drain the pond in less than the allowable time per State Requirements**.** The spreadsheet showing the detailed calculations can be found in **Appendix C.** The design of the outlet structure is detailed in the grading drawings.

The proposed detention pond was designed to provide water quality treatment as well as detain the 100-year storm event while maintaining the required 1-foot of freeboard. The proposed detention pond stage-storage curve is presented in **Table 4-2**.

Table 4-2: Detention Pond Stage-Storage Table

Elevation	Surface Area (Sq. Ft.)
7444	0
7445	20,284
7446	23,645
7447	26,149
7448	28,766

The model of the proposed site conditions was utilized to calculate discharge flow rates from the outlet structure in order to size the pond discharge culvert. **Table 4-3** presents the hydraulic capacity of the culvert and the required capacity to discharge flow from the outlet structure for the 100-year event. Detailed design of the pipe is provided in **Appendix A**.

DMC Fox Run Substation Drainage Report

Table 4-3: Outlet Pipe Hydraulic Capacity (100-year event)

Drainage Feature	Pipe Diameter (in)	Total Capacity (cfs)	Required Flow Capacity (cfs)	Remaining Capacity (cfs)
Pond Outlet	12	2.73	1.84	0.89

Table 4-4 presents the discharge rates for the proposed sub-basins for both the 25-year and 100-year 1-hour storm events prior to detention. This discharge value represents the flow rate that the pond is receiving. The discharge from the pond and other basins (total discharge from site) is summarized in **Table 5-1.**

Table 4-4: Proposed Sub-Basin Discharge Values (Pre-Detention)

Sub-Basin	10-Year Discharge (CFS)	100-Year Discharge (CFS)
Yard Area	14.07	28.42
Proposed North	10.03	26.75
Proposed South	5.58	12.04

Utilizing the flow rates presented above, the model was utilized to analyze the flow path of water through the piping and pond system. With the installation of the outlet structure, the pond was designed to pass both the 10-year and 100-year events, treat the required WQCV, and slowly release the water in the required length of time after the end of an event set forth by the State. The entire substation drains to the pond and the discharge rate leaving the pond is presented in **Table 5-1.**

Provide and explain Four Step Process
1. Runoff reduction proposed
2. Stabilization of drainage ways proposed/discussed
3. Proposed Stormwater Quality Capture Volume (WQCV) proposed
4. Identify Best Management Practices (BMP's) to be used to control industrial and commercial pollutants

A floodplain statement shall be provided indicating whether any portion of the development is in a designated floodplain as delineated on the current FEMA mapping.

DMC Fox Run Substation Drainage Report

5.0   Conclusions

5.1   Drainage Concept

The drainage design has been prepared using sound engineering judgement and practices and will provide an effective means of controlling runoff on the project site as well as protect the site from damage. The design has been completed according to common engineering practices and will result in no downstream impacts to any people or structures. Historic flow paths, discharge rates, and water quality have been maintained or improved.

5.2   Compliance with Common Practices

Per common practices, the historical discharge rate from the 100-year – 24-hour storm shall be utilized to determine the allowable discharge rate for the proposed improvements. To demonstrate compliance with this requirement, both the existing and proposed conditions were combined into one overall sub-basin. **Table 5-1** presents the overall discharge rates for the overall basin as well as the individual basins.

Table 5-1: Overall Sub-Basin Discharge Values (Post Detention)

Basin	10-Year Discharge (CFS)		100-Year Discharge (CFS)	
	Existing	Proposed	Existing	Proposed
Yard Area (Pond Outlet)	20.08	0.30	53.82	1.84
North		10.03		26.75
South		5.58		12.04
Total	20.08	15.91	53.82	40.63

The pond outlet structure was sized according to common practices so that the proposed condition 100-year discharge rate is less than the required discharge rate from the 100-year, 24-hour storm event, resulting in compliance with common practices.

The detention pond was also sized according to UDFCD requirements to treat the WQCV, detain the 100-year event, maintain 1 foot of freeboard, and maintain historical discharge patterns resulting in no downstream impacts.

Inspections of the pond and outlet structure will be conducted by the owner on an annual basis as well as after large storm events. If deficiencies are identified or if maintenance is required, maintenance of the outlet structure will be performed by the owner of the property in an effort to return the structure to its original level of functionality. Maintenance may involve cleaning of sediment and debris from the facility, maintaining vegetation growth around the structure, and performing any additional maintenance required.

Geotechnical Engineering Study

Geotechnical Engineering Study

11.2.2 Detention Facility Construction

The construction of detention facilities which multi-use benefits can provide significant benefits when properly planned and designed. Controlled outlets for flood surcharge storage should be provided, and it is required that such outlets be designed to release at a rate that does not exceed the peak rate estimated under natural conditions for the design storms, or other discharge established by policy and/or the drainage basin planning study.

Adequate safety measures shall be provided with all detention facilities. A minimum 15-foot maintenance easement shall be provided around the perimeter of the impoundment and embankment areas. Access to the bottom of the pond from a public road shall be provided via a minimum 15-foot wide ramp at a slope no greater than twelve (12) percent.

The geologic conditions of the site shall be investigated in sufficient detail to determine the suitability for impoundment of surface water. Ground water level increases downstream of the geologic investigation should be consistent with the class of structure and the complexity of the local site geology.

Guidelines for conducting geotechnical investigations for State of Colorado jurisdictional dams are presented in the draft "Design Review Manual" for dams and dam safety (Colorado Office of the State Engineer, July 31, 1986).

A design engineer check list for State of Colorado jurisdictional dams is included as Attachment A of this chapter. For non-jurisdictional dams i.e., those that do not or would not fall under State of Colorado purview, the designer must evaluate the appropriate factors identified, in the engineer check list, for the hazard rating presented as Attachment A and as otherwise required by the City/County.

9/30/90

11.3.3 Embankment Structures

The width of the top of the embankment structure shall be a minimum of 12 feet for embankments less than 25 feet in height. Also, side slopes on embankment structures will vary with materials types used and shall be designed to produce a stable and easily maintained structure. A slope stability analysis shall be required on all Class 1 structures.

An allowance for settlement shall also be factored into the design for all embankment structures. Consideration shall also be given to limiting excessive seepage through the embankment and foundation that may lead to embankment erosion and structure instability for all Class 1 structures.

A geotechnical analysis and report prepared by a Colorado Professional Engineer with recommendations for the foundation preparation and embankment construction shall be submitted to the City/County Engineer with the complete design analysis for all permanent detention facilities.

1. PURPOSE AND SCOPE OF STUDY

This report presents the results of Yeh and Associates, Inc. (Yeh) geotechnical engineering study for the proposed Fox Run substation in Monument, Colorado. Figure 1 shows the approximate location of the project site.
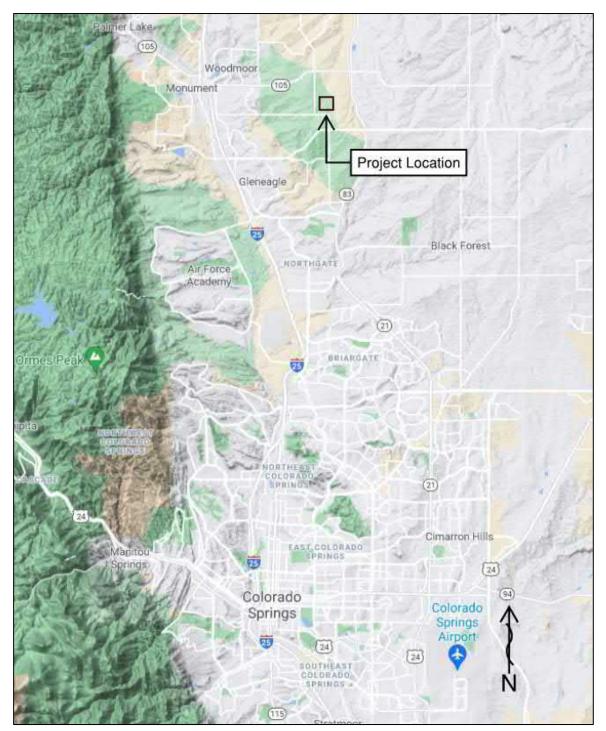

Figure 1. Project Location

The purpose of our study was to evaluate the subsurface conditions at the project site and provide geotechnical engineering recommendations for design and construction of the proposed substation project.

This report has been prepared in general accordance with our proposal for geotechnical engineering services, dated June 30, 2021. Our scope of services consisted of the following:

- Review available mapped geology at the site.
- Conduct a site observation and subsurface exploration to evaluate the existing subsurface conditions. The subsurface exploration included 16 geotechnical borings, 6 pressuremeter tests, and 1 soil electrical resistivity test performed at the approximate locations shown on Figure A-1 in Appendix A. The plans provided by Del-Mont Consultants, Inc. are included in Appendix A and present surveyed elevation data and northing and easting coordinates.
- Perform one Wenner 4-point resistivity test with an "a" spacing up to 500 feet
- Perform laboratory testing on soil samples obtained during the subsurface exploration to evaluate the engineering characteristics.
- Prepare a report that presents the results of our geotechnical engineering analyses, encountered site and subsurface conditions, recommendations for the foundation design, LPile and MFAD parameters, and earthwork recommendations.

The conclusions and recommendations presented herein are based on our limited site explorations and the subsurface conditions encountered at our boring locations during the time of our exploration. Our findings, conclusions, and recommendations should not be extrapolated to other areas of the site or used for other projects without our prior review. Additionally, they should not be used if the site has been altered or if more than two years has elapsed since the date of our final report without our prior review to determine if they remain valid.

1.1   Project Understanding

Based on the information provided, it is our understanding that the proposed project is for the design and construction of a new substation, Fox Run Substation, just north of the existing Monument Substation. The project is located in Monument, Colorado. We anticipate that site grading (cut and fill) of up to 2 feet will be required to achieve the final grade.

If the proposed construction is different than as described above, we should be contacted and provided the opportunity to evaluate our recommendations presented herein and evaluate if they remain valid based on the proposed construction.

2. SUBSURFACE EXPLORATION

2.1 Field Exploration

Our field exploration program consisted of advancing 16 borings to 30 feet below ground surface (BGS), one test pit, one electrical resistivity test, and 6 pressuremeter tests at the approximate locations shown on Figure A-1 in Appendix A. The boring locations were staked on site prior to the start of drilling operations. The plans provided by Del-Mont Consultants, Inc. are included in Appendix A and present surveyed elevation data and northing and easting coordinates. The borings were advanced with a truck-mounted drill rig equipped with both 4-inch diameter solid stem and 6-inch diameter hollow stem, continuous flight augers. Borings were advanced to an approximate depth of 30 feet below the existing ground surface (BGS). For each boring, 4 samples were collected within the upper 10 feet, and then at 5 feet intervals to the terminal depth. Samples were collected by driving either a standard penetration test (SPT) or Modified California (MC) split barrel sampler into the strata with a 140-pound hammer falling 30-inches. Pressuremeter tests were performed within the vicinity of Borings B-1, B-8, B-13, B-16, and the test pit location at selected depths to test the different strata encountered.

The SPT is a 2.0-inch O.D., 1.375-inch I.D. standard split barrel sampler following ASTM D1586. The Modified California (MC) Sampler is a 2.5-inch O.D., 2.0-inch I.D. (1.95-inch I.D. with liners), split barrel sampler with internal liners, following ASTM D3550. The blows required to drive the SPT sampler the final 12-inches is known as the SPT N-value. The MC Sampler "Penetration Resistance" refers to the sum of all blows required to drive the sampler the drive length of 12 inches or portion thereof. The SPT N-value and the MC penetration resistance represent the consistency or relative density the strata.

The boring logs and key to the boring logs are presented in Appendix B.

2.2 Laboratory Testing

Representative soil samples were selected for laboratory testing that was completed following industry standards and consistent with local practice. Laboratory soil testing included the following:

- Natural moisture-density;
- gradation analysis;
- Atterberg limits;
- Swell analysis testing;
- Analytical tests including water soluble sulfates and chlorides, soil resistivity, and pH.

Results of the laboratory tests are shown on the boring logs and are presented in the Laboratory Summary in Appendix C.

3. SITE AND SUBSURFACE CONDITIONS

3.1 Site Conditions

The proposed Fox Run substation project site is located northwest of the intersection of Higby Road and Shahara Road in Monument, Colorado. The project site is bounded to the south by the existing Monument Substation. The area surrounding the project site primarily consists of single-family housing and undeveloped lots. Vegetation consists of native grasses, weeds, and sparse pine trees. The project site is currently undeveloped and grades down from west to east.

Photographs 1 through 5 show the site conditions at the time of our exploration.

Photograph 1. Looking northeast from the southwest corner of proposed substation

Photograph 2. Looking southeast from Boring B-13

Photograph 3. Looking northwest from Boring B-16

Photograph 4. Looking south from Boring B-4

Photograph 5. Looking west from Boring B-12

3.2   Geologic Setting

Review of the "Geologic Map of the Monument Quadrangle, El Paso County, Colorado, Thorson, J.P., and Madole, R.F., Colorado Geological Survey, 2004" indicates that the geology at the project sites consists of the Dawson Formation. This unit consists of alluvial fan and fluvial deposits containing sands, gravels and varying amounts of clay that accumulated at the foot of the growing Rocky Mountain Front Ranges. This unit is characterized by white to light-tan, fine- to-medium grained sandstone that is poorly sorted with high clay content and is known to contain interbeds of thin to very thinly bedded gray claystone and sandy claystone. The geologic units mapped at the project site are presented in Figure 2.
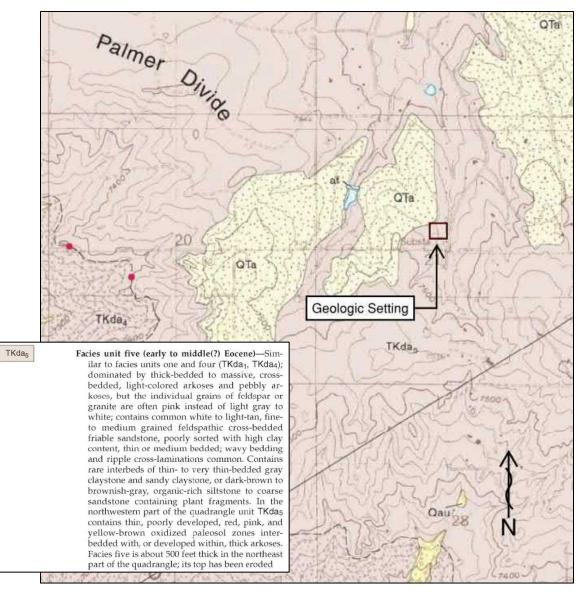

Figure 2. Geologic Setting

3.3   Subsurface Conditions

The subsurface soils encountered in our borings are generally consistent with the mapped geology. Sand, silt, and clay soils were encountered from the surface and extended to the termination depths of approximately 30 feet BGS in the borings. The sand soils encountered were tan, light brown to brown, white, and pale red with a loose to dense relative density. The silt and clay soils were white to tan, moist to dry, and soft to very stiff.

The boring logs in Appendix B present detailed results of our subsurface exploration.

3.4   Groundwater

Groundwater was not observed during drilling operation. Groundwater observations are representative of conditions at the time of our field exploration, and therefore may not be indicative of groundwater levels at other times of the year or at other locations across the site. Groundwater conditions may fluctuate with seasonal precipitation, site grading and improvements, and water level in the nearby drainage ditch and creek.

4. GEOLOGIC HAZARDS

The geologic hazards at the site have been evaluated based on the results of the subsurface exploration and laboratory testing, review of pertinent information and publications available for the site. The geologic hazards that are addressed as part of this report include the following items:

Expansive/Collapsible soil and expansive bedrock: Based on the results of the field investigation and laboratory testing, the soils encountered in the borings do not have a swell or collapse potential.

Unstable or potentially unstable slopes: The project site grades from west to east. No unstable slope was observed.

Landslide areas or potential landslide areas: The terrain at the project site and in the vicinity grades down from west to east. No landslide or potential landslide area was observed.

Debris fans: The site is not located on a debris fan and is not subject to debris flow.

Rockfall: The site is not located in a rockfall area.

Subsidence: The site is outside the limits of the known subsidence risk area. There was no underground mining operation identified in this area.

Shallow groundwater tables: Groundwater was not encountered to the termination depth of 30 feet BGS in the test borings. These observations represent groundwater conditions at the time of subsurface exploration and may not be indicative of other times or other locations.

Groundwater springs or seeps: No evidence of springs or seeps was observed on the site during our field exploration.

Flood prone areas: Flood mapping is not available at the time of this report. The project site is not included in current mapping for the 100-year flood hazard map from Federal Emergency Management Agency (FEMA). A 100-year flood has a 1% chance of occurring every year and 39% chance every 50 years.

Collapsing Soils: Laboratory testing did not show the encountered soils having a high collapse potential.

Faults: There are no known faults mapped in the vicinity of the project site.

Steeply dipping bedrock: Based on the map of steeply dipping bedrock prepared by Colorado Geologic Survey in 1999, the site is not within mapped zone of susceptible to differential heave from expansive, steeply dipping bedrock.

Elevated radioactivity: No radon testing was performed on site. However, the proposed development is a substation and has no enclosed building.

Conclusion: Based on the information presented above, the project site is considered to possess a low potential for geologic hazards for the proposed development.

5. CONSTRUCTION RECOMMENDATIONS

Site preparation and earthwork operations should be performed in accordance with applicable codes, safety regulations and other local, state, or federal guidelines. Earthwork on the project should be observed and evaluated by Yeh. The evaluation of earthwork should include observation and testing of engineered fills, subgrade preparation, foundation bearing soils, and other geotechnical conditions exposed during the construction of the project.

5.1   Site Preparation and Grading

Site preparation should begin by stripping and removal of existing vegetation, topsoil, and other deleterious materials from proposed structure areas. Stripped materials consisting of vegetation and organic materials should be wasted from the site or used to revegetate landscaped areas after completion of grading operations. All exposed surfaces should be free of mounds and depressions, which could prevent uniform compaction.

Following initial stripping and grading, all exposed areas which will receive fill or support structures, once properly cleared, should be scarified to a minimum depth of 8 inches, moisture conditioned, and compacted according to Section 5.4 of this report. Following any required undercutting and moisture conditioning, and prior to placement of structural fill, it is recommended that the exposed soil subgrade be proofrolled. Proofrolling of the subgrade aids in identifying soft or disturbed areas. Unsuitable areas identified by the proofrolling operation should be undercut and replaced with structural fill. Proofrolling can be accomplished through use of a fully-loaded, tandem-axle dump truck or similar equipment providing an equivalent subgrade loading.

Suitable structural fill should be placed to design grade as soon as practical after reworking the subgrade to avoid moisture changes in the underlying soils. Any fill materials should be placed on a horizontal plane and placed in loose lifts not to exceed 8-inches in thickness, unless otherwise accepted by Yeh. The moisture content and compaction of subgrade soils and structural fill should be maintained until slab construction or placement of pavement structures.

Based upon the subsurface conditions encountered, subgrade soils exposed during construction are anticipated to be relatively stable. However, the stability of the subgrade may be affected by precipitation, repetitive construction traffic and other factors. If unstable conditions are encountered or develop during construction, stability may be improved by scarifying and drying the subgrade soils. Over excavation of wet zones and replacement with structural fill or crushed rock may be necessary. If areas found to be unsuitable for re-work, additional stabilization will be required. If additional stabilization is required, Yeh should be contacted to evaluate the conditions in field, and a suitable stabilization method can be provided. In addition, any soft and/or wet areas exposed during the excavation may need to be stabilized prior to the placement of new fill and pavement sections to create a stable, firm construction platform. A typical stabilization method may include utilizing gravel with the combination of geo-grid (e.g. Tensar TX160) to create a stable base. Other stabilization methods may also be appropriate.

5.2   Excavation and Trench Construction

Excavations into the on-site soils will encounter a variety of conditions. All excavations must comply with the applicable local, State, and Federal safety regulations, and particularly with the excavation standards of the Occupational Safety and Health Administration (OSHA). Construction site safety, including excavation safety, is the sole responsibility of the Contractor as part of its overall responsibility for the means, methods, and sequencing of construction operations. Yeh's recommendations for excavation support is provided for the Client's sole use in planning the project, in no way do they relieve the Contractor of its responsibility to construct, support, and maintain safe slopes. Under no circumstances should the following recommendations be interpreted to mean that Yeh is assuming responsibility for either construction site safety or the Contractor's activities.

We believe the overburden soil encountered above groundwater level on this site will classify as a Type C material, using OSHA criteria. OSHA requires that unsupported cuts be no steeper than 1½:1 for Type C for unbraced excavations up to 20 feet in height. In general, we believe that these slope ratios will be temporarily stable under unsaturated conditions. Flattened slopes will be required if excavations extended below groundwater, or the slopes will be exposed for an extended period of time. Please note that the Contractor's OSHA-qualified "competent person" must make the actual determination of soil type and allowable sloping in the field.

The soils encountered by the proposed excavations may vary significantly across the site. The preliminary classifications presented above are based solely on the materials encountered in our exploratory test borings. The contractor should verify that similar conditions exist throughout the proposed area of excavation.

As a safety measure, it is recommended that all vehicles and soil piles be kept to a lateral distance equal to at least the depth of the excavation from the crest of the slope. The exposed slope face should be protected against the elements and monitored by the contractor on at least a daily basis.

5.3   Structural Fill Requirements

Based on our laboratory test results, the on-site sand and silt soils may be utilized as structural fill. Additional imported structural fill, if required, should consist of non-expansive granular material meeting the criteria presented in Table 5-1. The onsite sandy soils encountered are suitable for reuse as structural fill.

Table 5-1 Imported Structural Fill Criteria

Gradation Requirements	
Standard Sieve Size	Percent Passing
2 inch	100
No. 200	10 - 30
Plasticity Requirements (Atterberg Limits)	
Liquid Limit	30 or less
Plasticity Index	6 or less

We recommend that a qualified representative of Yeh visit the site during excavation and during placement of the structural fill to verify the soils exposed in the excavations are consistent with those encountered during our subsurface exploration and that proper foundation subgrade preparation and placement is performed.

All fill placed on this site should be compacted according to the recommendations in Section 5.4 of this report. Fill to be placed at this site during leveling/grading operations should be placed under controlled conditions. A sample of any imported fill material, if required, should be submitted to our office for approval and testing at least 3 days prior to stockpiling at the site.

5.4   Compaction Requirements

Much of the sand, silty sand, and clayey sand soils encountered during our exploration are suitable for use as structural fill materials provided organics and other deleterious material are removed following section 5.1 above. Table 5-2, below, presents the fill placement criteria.

Structural fill should be placed in level lifts not exceeding 8-inches in loose thickness and compacted to the specified percent compaction to produce a firm and unyielding surface. If field density tests indicate the required percent compaction has not been obtained, the fill material should be reconditioned as necessary and re-compacted to the required percent compaction before placing any additional material.

Table 5-2 Subgrade Preparation and Fill Placement Criteria

Fill Location	Material Type	Percent Compaction (ASTM Method)	Moisture Content
Foundation Subgrade Soils	On Site Sandy Soils	95 minimum (ASTM D698)	± 2 % of OMC[1]
	Imported Structural Fill	95 minimum (ASTM D1557)	± 2 % of OMC[1]
Trench Backfill	On Site Sandy Soils	90 minimum (ASTM D698)	0 to +2 % of OMC

1.OMC = Optimum Moisture Content determined from Proctor Test

5.5   Utility Trench Backfill

On-site soils may be utilized as backfill material in utility trenches provided the backfill is essentially free of plant matter, organic soil, debris, trash, other deleterious matter, and rock particles larger than 2-inches in diameter. Backfill should be placed in lifts of 8-inches or less and compacted with appropriate trench equipment. Utility trench backfill should be compacted as recommended in Section 5.4 of this report.

5.6   Drainage Considerations

Positive drainage should be provided during construction and maintained throughout the life of the proposed project. Proper design of drainage should include prevention of ponding water on or immediately adjacent to the structures. Surface features that could retain water in areas adjacent to the structures should be sealed or eliminated. Backfill against any kind of structure and in utility line trenches should be well compacted and free of all construction debris to reduce the possibility of moisture infiltration and migration. Concentrated runoff should be avoided in areas susceptible to erosion and slope instability. Slopes and other stripped areas should be protected against erosion by re-vegetation or other methods.

5.7   Construction in Wet or Cold Weather

Grading fill, structural fill, or other fill should not be placed on frosted or frozen ground, nor should frozen material be placed as fill. Frozen ground should be allowed to thaw or be completely removed prior to placement of fill. A good practice is to cover the compacted fill with a "blanket" of loose fill to help prevent the compacted fill from freezing.

Concrete structures should not be constructed on frozen soil. Frozen soil should be completely removed from beneath the concrete elements, or thawed, scarified and re-compacted. The amount of time passing between excavation or subgrade preparation and placing concrete should be minimized during freezing conditions to prevent the prepared soils from freezing. Blankets, soil cover, or heating as required may be utilized to prevent the subgrade from freezing.

5.8   Chemical Sulfate Susceptibility and Concrete Type

The concentration of water-soluble sulfates measured in samples obtained from the borings was observed to be from less than 0.001% to .006%. This concentration of water-soluble sulfates represents a Class 0 degree of sulfate attack on concrete exposed to the soils tested. The degree of attack is based on a range of Class 0 (negligible) to Class 3 (very severe) as described in the American Concrete Institute (ACI) Standard 201.2R, "Guide to Durable Concrete".

Sulfate resistant cement in accordance with Section 601.04 of the 2021 CDOT Standard Specifications for Road and Bridge Construction should be utilized for all concrete elements on this project.

5.9   Corrosion Potential

Analytical testing was completed on representative samples from the geotechnical borings. Test results are presented in Table 5-3.

Table 5-3. Analytical Test Results

Sample Location	Soil Type	Water Soluble Chlorides (%)	pH	Resistivity (ohm-cm)	Water Soluble Sulfates (%)
B-3 @ 4 ft	Silty Sand	0.0002	7.0	9,308	<0.001
B-6 @ 4 ft	Silty Sand	0.0006	7.2	5,435	0.006
B-11 @ 4 ft	Silty Sand	0.0004	7.1	9,223	<0.001

Corrosion of buried metal is an electrochemical process in which the amount of metal loss due to corrosion is directly proportional to the flow of electrical current (DC) from metal into the soil. As resistivity decreases, the corrosivity of the soil increases. The following table provides a correlation between soil resistivity and corrosivity towards ferrous metal, as recommended by "Underground Corrosion, NBS Circular 579", Melvin Romanoff, 1957.

Table 5-4. Resistivity and Corrosivity Categories

Resistivity in Ohm-centimeters	Corrosivity Category
0 to 1,000	Severely Corrosive
1,000 to 2,000	Corrosive
2,000 to 10,000	Moderately Corrosive
Greater than 10,000	Mildly Corrosive

Based on the resistivity test results, the existing soils are anticipated to be moderately corrosive to unprotected iron or steel structures. A qualified corrosion engineer should review this data to determine the appropriate corrosion protection measures at the site.

6. FOUNDATION DESIGN RECOMMENDATIONS

The site appears suitable for the proposed construction based upon geotechnical conditions encountered in the borings. Based on the geotechnical engineering analyses, subsurface exploration, and laboratory test results, we recommend that the structures be supported on a spread footing or a mat foundation system bearing on properly prepared on-site soils, or properly compacted imported structural fill. Design details for shallow foundations are provided following Allowable Stress Design (ASD).

6.1 Spread Footings

The proposed structures may be supported on shallow spread footings or mat foundations, that are founded on properly prepared and compacted structural fill or native sand and clayey sand soils. Footings placed on properly prepared subgrade soils may be designed as follows.

1. The maximum allowable bearing pressure for spread footings founded on properly prepared subgrade soils is 3,500 pounds per square foot (psf). The allowable bearing pressure is based on a factor of safety (F.O.S.) of approximately three with respect to shear failure of the foundation bearing materials. A one third increase in the allowable bearing pressure may be used for the maximum allowable bearing pressure for temporary loading conditions including wind or seismic conditions.

2. Lateral capacity of the footings may be derived from passive resistance along the vertical face of the footings, and friction between the bottom of the footings and the foundation soils. An allowable passive resistance using an equivalent fluid pressure of 185 pcf (F.O.S. of 2) may be used to calculate passive earth pressure. Passive pressure should be ignored in the upper 30-inches below exposed ground surface. An allowable coefficient of friction of 0.32 (F.O.S. of 1.5) between the bottom of the footings and the on-site/ /structural fill may be used for the sliding resistance.

3. For the uplift capacity, it is recommended that the combined weight of the footing plus the soil immediately above it exceeds twice the maximum uplift forces. The weight of the soil immediately above the footings may be designed using a unit weight of 125 pcf.

4. All footings should be founded a minimum of 30-inches below the final grade to provide protection against frost penetration. Isolated spread footings should have a minimum width of 18 inches.

Footings should be proportioned to reduce differential foundation movement. Proportioning on the basis of equal total movement is recommended; however, proportioning to relative constant dead load pressure will also reduce differential movement between adjacent footings. Total vertical movement is estimated to be on the order of 1-inch or less. Differential settlement is anticipated to be on the order of ½ to ¾ of the estimated total vertical movement. Additional foundation movements could occur if water from any source infiltrates the foundation soils, therefore, proper drainage should be provided in the design and during construction.

If the soil conditions encountered differ significantly from those presented in this report, supplemental recommendations will be required.

An allowable modulus of subgrade reaction, K_{V1}, of 100 pounds per cubic inch may be used for design of mat foundations. K_{V1} refers to a 1-foot square plate and should be adjusted for actual foundation dimensions using the following equation (B is foundation width in feet):

$$K_V = K_{V1} \left(\frac{B + 1}{2B} \right)^2$$

Footings and foundations should be reinforced as necessary to reduce the potential for distress caused by differential foundation movement. Foundation excavations should be observed by the geotechnical engineer. If the soil conditions encountered differ significantly from those presented in this report, supplemental recommendations will be required.

6.2 Drilled Shaft Foundation System

We understand support towers may be founded on drilled shaft foundations. Tri-State uses the software package MFAD and LPile for foundation analysis and design.

6.2.1 Axial Capacity

The design criteria presented below are recommended for a straight-shaft pier foundation system.

1. Drilled piers founded a minimum of 15 feet below existing ground surface may be designed for an allowable end bearing pressure and side skin friction as presented in Table 6-1.

Table 6-1. Allowable Drilled Shaft Axial Capacity

Material	Allowable End Bearing Capacity (ksf)[1]	Allowable Side Skin Friction[2,3]	
		Compression (ksf)	Uplift (ksf)
Sand	6.8	0.85	0.62
Clay	6.0	0.65	0.55
Dawson Formation	8.8	0.96	0.77

[1] Factor of Safety (FOS)= 3
[2] FOS= 2.5
[3] Upper 5 feet should be ignored for side friction.

2. For drilled foundations constructed in accordance with the recommendations presented in Table 6-1, total foundation settlement should be less than 1-inch.

3. A minimum pier diameter of 18 inches is recommended to facilitate proper cleaning and observation of pier hole. Piers should be spaced apart at least 3 pier diameters from center to center. Piers should be reinforced for their full length designed to resist the deficit between the design dead load on the pier and the uplift pressures acting on the pier perimeter.

4. In our experience, the onsite soils can be vulnerable to caving, especially if groundwater is present. The contractor should plan on temporary casing being required to complete the pier holes.

5. Pier holes should be properly cleaned prior to placement of concrete. Concrete should be placed in piers the same day they are drilled. Failure to place concrete the day of drilling will normally result in a requirement for lengthening the pier penetration. The presence of groundwater or caving soils may require that concrete be placed immediately after the pier hole drilling is completed. The Contractor should take care to prevent enlargement of the excavation at the tops of piers, which could result in mushrooming of the pier top.

6. Concrete utilized in the piers should be a fluid mix with sufficient slump so that it will fill the void between reinforcing steel and the pier hole wall. We recommend the concrete have a minimum slump in the range of 5 to 7 inches. For dry excavation, concrete can be placed by either tremie or free fall methods using hopper or other approved equipment. Wet excavated shafts will require concrete placement using tremie or pumping methods. The tremie pipe should be clean and have a suitable inside diameter for use with the specific concrete mix, but not less than 8 inches. The discharge end of the tremie should allow free radial flow of the concrete and be immersed in concrete and maintain a positive pressure differential at all times during placement to prevent water or slurry intrusion.

7. The pier drilling Contractor should mobilize equipment of sufficient size and operating capability to achieve the required penetration into the very dense, cemented sand soils. If refusal is encountered in these materials, the Geotechnical Engineer should evaluate the conditions to establish that true refusal has been met with adequate drilling equipment. A representative of the Geotechnical Engineer should be retained to observe pier drilling operations on a full-time basis.

6.2.2 Lateral Capacity

We understand that computer programs MFAD and LPILE will be used for the design of the drilled pier foundation systems. The following tables present the recommended soil engineering properties for use with MFAD and LPILE. Figure A-3 to A-6 presents a subsurface profile along the Fox Run Substation and the MFAD parameters for each layer. The lateral resistance of the soil should be ignored within the upper 5 feet of the ground surface.

Table 6-2. MFAD Parameters for Design of Drilled Shaft Foundations

MFAD Parameter Designation	Materials	Total Unit Weight (pcf)	Deformation Modulus, E_p	Ultimate Rock Concrete Bond Strength (ksf)	Friction Angle (°)	Cohesion (psf)
A	Silty SAND	125	1,339 psi	N/A	30	0
B	Clayey SAND	125	1,341 psi	N/A	32	0
C	Sandy Lean CLAY	120	3,114 psi	N/A	0	2,000
D	Sandy SILT	120	850 psi	N/A	0	500
E	Poorly Graded SAND w/ Silt	125	1,068 psi	N/A	32	0

Table 6-3. LPILE Parameters for Design of Drilled Shaft Foundations

Materials	Soil Model	Total Unit Weight (pcf)	Soil Modulus K (pci)	Strain Factor, ε_{50}	Friction Angle (°)	Cohesion (psf)
Sandy Soils	Sand (Reese)	125	90	N/A	32	0
Silty Sand	Sand (Reese	125	25	N/A	30	0
Clay	Stiff Clay	120	N/A	0.007	0	2,000
Silt	Soft Clay	120	N/A	.020	0	500

7. SEISMICITY

No current active faults are known to exist in the immediate vicinity of the proposed project location. Based on the site class definitions from IBC 2015, this site can be categorized as a Site Class D. The project site can be categorized as Risk Category I.

The peak ground acceleration and the short- and long- period spectral acceleration coefficients for a Site Class B (reference site class), site factors for site class D, and site-specific elastic response coefficients were determined using the seismic design maps from the USGS website. The seismic design parameters for the reference site and site class D are shown below.

Table 7-1. Seismic Design Parameters

S_S	F_a	S_{MS} $(S_{MS} = F_aS_s)$	S_{DS} $(S_{DS} = 2/3\ S_{MS})$
0.182	1.6	0.291	0.194
S_1	F_V	S_{M1} $(S_{M1} = F_vS_1)$	S_{D1} $(S_{D1} = 2/3\ S_{M1})$
0.06	2.4	0.143	0.096

S_S = The mapped spectral accelerations for short periods (U.S. Geological Survey Web Page, 2021)
F_a = Site coefficient from Table 1613.5.3(1), 2015 IBC
S_{MS} = The maximum considered earthquake spectral response accelerations for short periods
S_{DS} = 5-percent damped design spectral response acceleration at short periods

S_1 = The mapped spectral accelerations for 1-second period (U.S. Geological Survey Web Page, 2021)
F_V = Site coefficient from Table 1613.5.3(2), 2015 IBC
S_{M1} = The maximum considered earthquake spectral response accelerations for 1-second period
S_{D1} = 5-percent damped design spectral response acceleration at 1-second period

8. IN-SITU SOIL RESISTIVITY TESTING

Field soil resistivity test was performed at the project site of the proposed substation by Mapes In-Situ, Inc. using the Wenner four-point method in accordance with ASTM G57-06. The equipment used was a Terrameter SAS 1000, manufactured by ABEM.

The Wenner method uses four equally-spaced metal probes or electrodes driven into the ground, along a straight line. An alternating current is applied across the outer two probes, and voltage is measured across the inner probes. Using Ohm's Law (R=V/I), the resistance value is calculated. The apparent soil resistivity is the average resistance of the soil mass along the electrical field lines from the ground surface to a depth approximately equal to the distance between probes, and calculated as following:

$$\rho = A\,2\,\pi\,R$$

Where: ρ = apparent soil resistivity (ohm-cm)

A = distance between the electrodes (cm)

R = measured resistance (ohms)

π = constant pi (3.1416)

Resistance measurements were conducted with probe spacings of 2, 3, 5, 7, 10, 20, 30, 50, 70,100, 200, 300, and 500 feet in the NW-SE and NE-SW orientations. The probes used in the field soil resistivity tests are metal probes with a diameter of 0.375-inch, and height of 18-inch. The probes were driven into the ground with a penetration of 1.5, 3, 6, 9, and 12 inches, depending on the "A" spacing length. The Terrameter SAS 1000 resistivity meter emits a 200 mA direct current four (4) separate times to produce 4 readings during the measurement and the averaged values are recorded. The results of the field resistivity tests are presented in the table below and in Appendix B.

Table 8-1 Field Resistivity Results

"A" Spacing (feet)	NW-SE Line		NE-SW Line	
	Field Resistance (ohm)	Apparent Resistivity (ohm-cm)	Field Resistance (ohm)	Apparent Resistivity (ohm-cm)
2	78.996	30,255	72.614	27,811
3	44.925	25,809	43.917	25,230

9. LIMITATIONS

The findings and recommendations presented in this report are based upon data obtained from borings, field observations, laboratory testing, our understanding of proposed construction, and other sources of information referenced in this report. It is possible that subsurface conditions may vary between or beyond the locations explored. The nature and extent of such variations may not become evident until construction. If during construction conditions appear to be different from those described herein, Yeh should be advised and provided the opportunity to observe and evaluate those conditions and provide additional recommendations, as necessary. Yeh should also be contacted if the scope of construction changes from that generally described within this report. The conclusions and recommendations contained in this report shall not be considered valid unless Yeh reviews all proposed construction changes and either verifies or modifies the conclusions of this report in writing.

This report was prepared in in a manner consistent with that level of care and skill ordinarily exercised by other members of the profession practicing in the same locality, under similar conditions and at the date the services are provided. Yeh makes no other representation, guarantee, or warranty, express or implied, regarding the services, communication (oral or written), report, opinion, or instrument of service provided.

This report may be used only by the Client and the registered design professional in responsible charge and only for the purposes stated for this specific engagement within a reasonable time from its issuance, but in no event later than two (2) years from the date of the report.

Appendix B

KEY TO BORING LOGS

BORING LOGS

PRESSUREMETER TEST RESULTS

ELECTRICAL RESISTIVITY TEST RESULTS

Legend for Symbols Used on Borehole Logs

Sample Types

- Bulk Sample of auger/odex cuttings
- Modified California Sampler (2.5 inch OD, 2.0 inch ID)
- Standard Penetration Test (ASTM D1586)

Drilling Methods

- HOLLOW-STEM AUGER
- SOLID-STEM AUGER

Lithology Symbols   (see Boring Logs for complete descriptions)

- Clayey Sand (SC)
- Lean Clay (CL)
- Poorly Graded Gravel with Sand (GP)
- Poorly Graded Sand with Silt (SP-SM)
- Interbedded claystone and sandstone
- Sandy Lean Clay (CL)
- Sandy Silt
- Silty Clay (CL-ML)
- Silty, Clayey Sand (SC-SM)
- Silty Gravel (GM)
- Silty Sand (SM)
- Topsoil

Lab Test Standards

Moisture Content	ASTM D2216
Dry Density	ASTM D7263
Sand/Fines Content	ASTM D421, ASTM C136, ASTM D1140
Atterberg Limits	ASTM D4318
AASHTO Class.	AASHTO M145, ASTM D3282
USCS Class.	ASTM D2487

(Fines = % Passing #200 Sieve
Sand = % Passing #4 Sieve, but not passing #200 Sieve)

Other Lab Test Abbreviations

pH	Soil pH (AASHTO T289-91)
S	Water-Soluble Sulfate Content (AASHTO T290-91, ASTM D4327)
Chl	Water-Soluble Chloride Content (AASHTO T291-91, ASTM D4327)
S/C	Swell/Collapse (ASTM D4546)
UCCS	Unconfined Compressive Strength (Soil - ASTM D2166, Rock - ASTM D7012)
R-Value	Resistance R-Value (ASTM D2844)
DS (C)	Direct Shear cohesion (ASTM D3080)
DS (phi)	Direct Shear friction angle (ASTM D3080)
Re	Electrical Resistivity (AASHTO T288-91)
PtL	Point Load Strength Index (ASTM D5731)

Notes

1. Visual classifications are in general accordance with ASTM D2488, "Standard Practice for Description and Identification of Soils (Visual-Manual Procedures)".
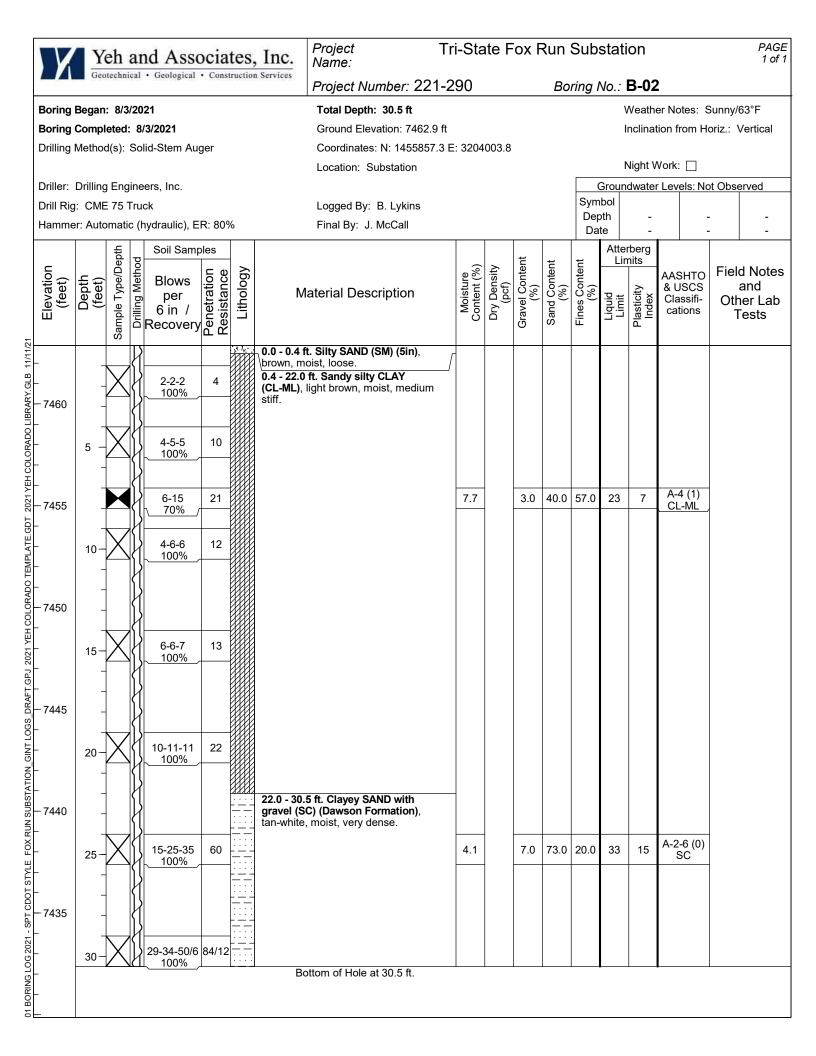

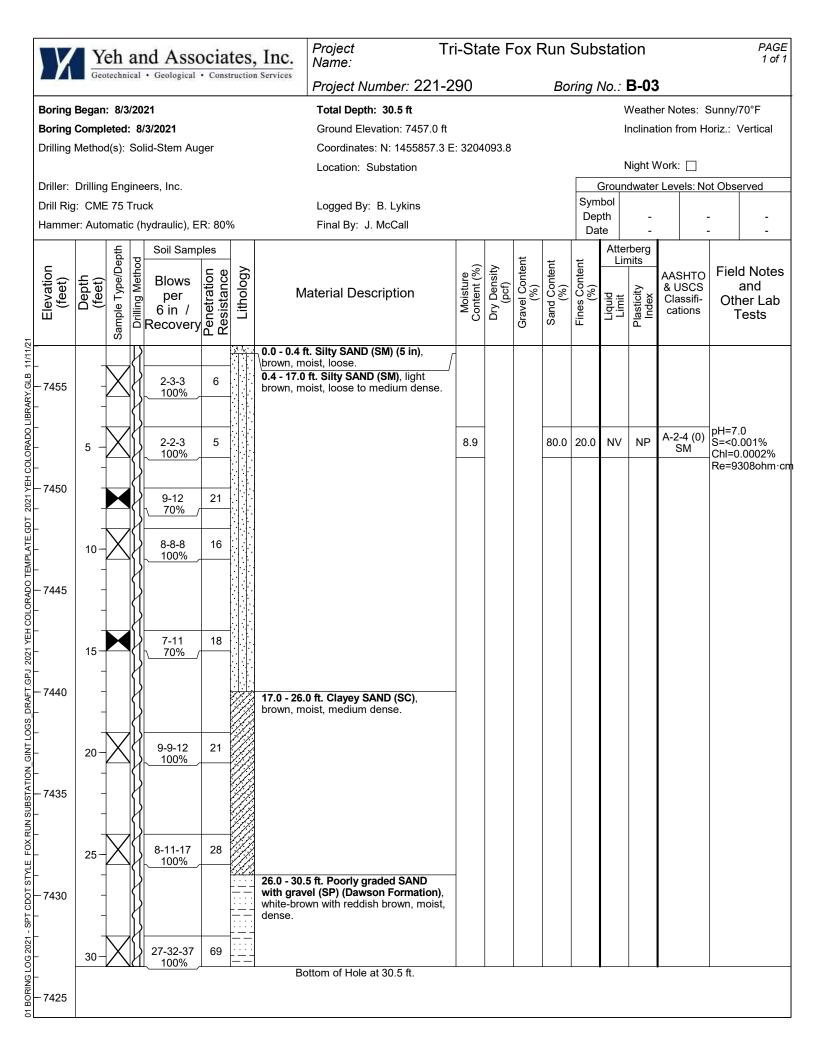

2. "Penetration Resistance" on the Boring Logs refers to the uncorrected N value for SPT samples only, as per ASTM D1586. For samples obtained with a Modified California (MC) sampler, drive depth is 12 inches, and "Penetration Resistance" refers to the sum of all blows. Where blow counts were > 50 for the 3rd increment (SPT) or 2nd increment (MC), "Penetration Resistance" combines the last and 2nd-to-last blows and lengths; for other increments with > 50 blows, the blows for the last increment are reported.

3. The Modified California sampler used to obtain samples is a 2.5-inch OD, 2.0-inch ID (1.95-inch ID with liners), split-barrel sampler with internal liners, as per ASTM D3550. Sampler is driven with a 140-pound hammer, dropped 30 inches per blow.
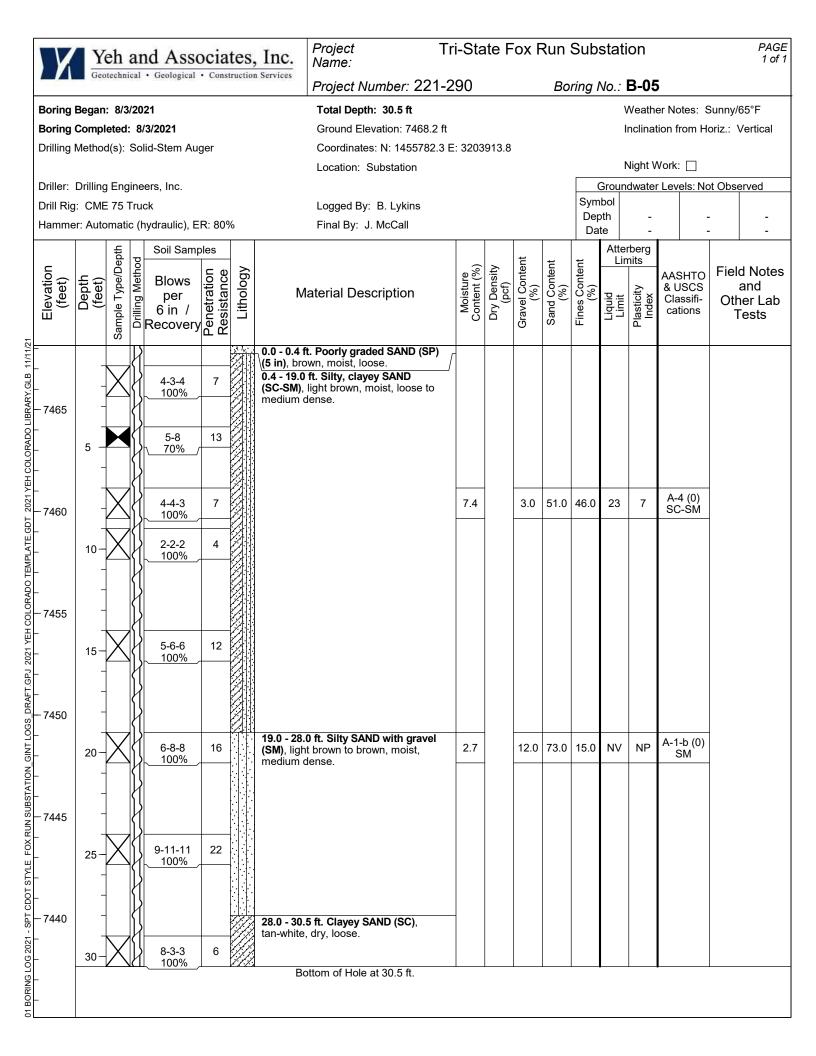

4. "ER" for the hammer is the Reported Calibrated Energy Transfer Ratio for that specific hammer, as provided by the drilling company.

Corrected Data / Elastic Boundaries — Pressure (kPa) vs. Volume (cm^3)

Interpreted Test Results

Deformation Modulus, E_P	9,234	kPa	1,339	psi
Reload Modulus, E_R	n.a.	kPa	n.a.	psi
Yield Pressure, P_F	312	kPa	45	psi
Ultimate Pressure, P_L [1]	872	kPa	127	psi
E_P / P_L	10.6			
P_L / P_F	2.8			

Test Remarks

[1] Ultimate Pressure, P_L, is interpreted by extrapolating the data points in the plastic phase of the curve to 2 times the initial volume of the test zone, and reading the corresponding pressure.

Accordingly, caution must be used in regards to the use of Ultimate Pressure values, particularly when a small quantity of data points are collected in the plastic phase, or when deformation is minimal due to the stiffness of the material.

Interpreted Test Results

Deformation Modulus, E_P	9,245	kPa	1,341	psi
Reload Modulus, E_R	n.a.	kPa	n.a.	psi
Yield Pressure, P_F	376	kPa	55	psi
Ultimate Pressure, P_L [1]	1,112	kPa	161	psi
E_P / P_L	8.3			
P_L / P_F	3.0			

Test Remarks

Test performed in a dry borehole.

[1] Ultimate Pressure, P_L, is interpreted by extrapolating the data points in the plastic phase of the curve to 2 times the initial volume of the test zone, and reading the corresponding pressure.

Accordingly, caution must be used in regards to the use of Ultimate Pressure values, particularly when a small quantity of data points are collected in the plastic phase, or when deformation is minimal due to the stiffness of the material.

Reload Modulus, E_R	n.a.	kPa	n.a.	psi
Yield Pressure, P_F	239	kPa	35	psi
Ultimate Pressure, P_L [1]	625	kPa	91	psi
E_P / P_L	10.6			
P_L / P_F	2.6			

Test Remarks

Test performed in dry borehole.

[1] Ultimate Pressure, P_L, is interpreted by extrapolating the data points in the plastic phase of the curve to 2 times the initial volume of the test zone, and reading the corresponding pressure.

Accordingly, caution must be used in regards to the use of Ultimate Pressure values, particularly when a small quantity of data points are collected in the plastic phase, or when deformation is minimal due to the stiffness of the material.

Project	Fox Run Substation
Date	8/4/2021
Weather / Temp	Sunny / warm, 75°F
Recent Weather	Rain
Terrain	Rolling hills generally sloping down toward the east and south.
Soil Conditions	Surface soil was moist. Very good electrode contact.

Instrument	ABEM Terrameter SAS 1000
Serial No.	2000542
100 Ω Resistor Check	100.2

DETENTION BASIN STAGE-STORAGE TABLE BUILDER

MHFD-Detention, Version 4.04 (February 2021)

Project: Fox Run Substation

Basin ID: Detention Pond

Example Zone Configuration (Retention Pond)

Watershed Information

Selected BMP Type =	EDB	
Watershed Area =	4.95	acres
Watershed Length =	500	ft
Watershed Length to Centroid =	50	ft
Watershed Slope =	0.010	ft/ft
Watershed Imperviousness =	40.00%	percent
Percentage Hydrologic Soil Group A =	0.0%	percent
Percentage Hydrologic Soil Group B =	100.0%	percent
Percentage Hydrologic Soil Groups C/D =	0.0%	percent
Target WQCV Drain Time =	40.0	hours
Location for 1-hr Rainfall Depths =	User Input	

After providing required inputs above including 1-hour rainfall depths, click 'Run CUHP' to generate runoff hydrographs using the embedded Colorado Urban Hydrograph Procedure.

Optional User Overrides

Water Quality Capture Volume (WQCV) =	0.074	acre-feet	acre-feet
Excess Urban Runoff Volume (EURV) =	0.208	acre-feet	acre-feet
2-yr Runoff Volume (P1 = 0.92 in.) =	0.122	acre-feet	0.92	inches
5-yr Runoff Volume (P1 = 1.21 in.) =	0.185	acre-feet	1.21	inches
10-yr Runoff Volume (P1 = 1.47 in.) =	0.262	acre-feet	1.47	inches
25-yr Runoff Volume (P1 = 1.86 in.) =	0.427	acre-feet	1.86	inches
50-yr Runoff Volume (P1 = 2.18 in.) =	0.543	acre-feet	2.18	inches
100-yr Runoff Volume (P1 = 2.53 in.) =	0.693	acre-feet	2.53	inches
500-yr Runoff Volume (P1 = 3.43 in.) =	1.040	acre-feet	3.43	inches
Approximate 2-yr Detention Volume =	0.119	acre-feet		
Approximate 5-yr Detention Volume =	0.173	acre-feet		
Approximate 10-yr Detention Volume =	0.247	acre-feet		
Approximate 25-yr Detention Volume =	0.306	acre-feet		
Approximate 50-yr Detention Volume =	0.335	acre-feet		
Approximate 100-yr Detention Volume =	0.398	acre-feet		

Define Zones and Basin Geometry

Zone 1 Volume (WQCV) =	0.074	acre-feet
Zone 2 Volume (100-year - Zone 1) =	0.323	acre-feet
Select Zone 3 Storage Volume (Optional) =		acre-feet

DETENTION BASIN OUTLET STRUCTURE DESIGN

MHFD-Detention, Version 4.04 (February 2021)

Project: Fox Run Substation
Basin ID: Detention Pond

Example Zone Configuration (Retention Pond)

	Estimated Stage (ft)	Estimated Volume (ac-ft)	Outlet Type
Zone 1 (WQCV)	0.67	0.074	Orifice Plate
Zone 2 (100-year)	1.58	0.323	Weir&Pipe (Circular)
Zone 3			
Total (all zones)		0.398	

User Input: Orifice at Underdrain Outlet (typically used to drain WQCV in a Filtration BMP)

			Calculated Parameters for Underdrain		
Underdrain Orifice Invert Depth =	N/A	ft (distance below the filtration media surface)	Underdrain Orifice Area =	N/A	ft^2
Underdrain Orifice Diameter =	N/A	inches	Underdrain Orifice Centroid =	N/A	feet

User Input: Orifice Plate with one or more orifices or Elliptical Slot Weir (typically used to drain WQCV and/or EURV in a sedimentation BMP)

			Calculated Parameters for Plate		
Invert of Lowest Orifice =	0.00	ft (relative to basin bottom at Stage = 0 ft)	WQ Orifice Area per Row =	1.222E-02	ft^2
Depth at top of Zone using Orifice Plate =	2.00	ft (relative to basin bottom at Stage = 0 ft)	Elliptical Half-Width =	N/A	feet
Orifice Plate: Orifice Vertical Spacing =	6.00	inches	Elliptical Slot Centroid =	N/A	feet
Orifice Plate: Orifice Area per Row =	1.76	sq. inches (diameter = 1-1/2 inches)	Elliptical Slot Area =	N/A	ft^2

User Input: Stage and Total Area of Each Orifice Row (numbered from lowest to highest)

	Row 1 (required)	Row 2 (optional)	Row 3 (optional)	Row 4 (optional)	Row 5 (optional)	Row 6 (optional)	Row 7 (optional)	Row 8 (optional)
Stage of Orifice Centroid (ft)	0.00	0.50	1.00	1.50				
Orifice Area (sq. inches)	1.76	1.76	1.76	1.76				

	Row 9 (optional)	Row 10 (optional)	Row 11 (optional)	Row 12 (optional)	Row 13 (optional)	Row 14 (optional)	Row 15 (optional)	Row 16 (optional)
Stage of Orifice Centroid (ft)								
Orifice Area (sq. inches)								

User Input: Vertical Orifice (Circular or Rectangular)

	Not Selected	Not Selected		Calculated Parameters for Vertical Orifice	Not Selected	Not Selected	
Invert of Vertical Orifice =			ft (relative to basin bottom at Stage = 0 ft)	Vertical Orifice Area =			ft^2
Depth at top of Zone using Vertical Orifice =			ft (relative to basin bottom at Stage = 0 ft)	Vertical Orifice Centroid =			feet
Vertical Orifice Diameter =			inches				

User Input: Overflow Weir (Dropbox with Flat or Sloped Grate and Outlet Pipe OR Rectangular/Trapezoidal Weir (and No Outlet Pipe)

	Zone 2 Weir	Not Selected		Calculated Parameters for Overflow Weir	Zone 2 Weir	Not Selected	
Overflow Weir Front Edge Height, Ho =	0.55		ft (relative to basin bottom at Stage = 0 ft)	Height of Grate Upper Edge, H$_t$ =			feet
Overflow Weir Front Edge Length =			feet	Overflow Weir Slope Length =			feet
Overflow Weir Grate Slope =			H:V	Grate Open Area / 100-yr Orifice Area =			
Horiz. Length of Weir Sides =			feet	Overflow Grate Open Area w/o Debris =			ft^2
Overflow Grate Type =				Overflow Grate Open Area w/ Debris =			ft^2
Debris Clogging % =			%				

User Input: Outlet Pipe w/ Flow Restriction Plate (Circular Orifice, Restrictor Plate, or Rectangular Orifice)

	Zone 2 Circular	Not Selected		Calculated Parameters for Outlet Pipe w/ Flow Restriction Plate	Zone 2 Circular	Not Selected	
Depth to Invert of Outlet Pipe =			ft (distance below basin bottom at Stage = 0 ft)	Outlet Orifice Area =			ft^2
Circular Orifice Diameter =			inches	Outlet Orifice Centroid =			feet
				Half-Central Angle of Restrictor Plate on Pipe =	N/A	N/A	radians

User Input: Emergency Spillway (Rectangular or Trapezoidal)

				Calculated Parameters for Spillway		
Spillway Invert Stage =		ft (relative to basin bottom ...)		Spillway Design Flow Depth =		feet
Spillway Crest Length =		feet		Stage at Top of Freeboard =		feet
Spillway End Slopes =		H:V		Basin Area at Top of Freeboard =		acres
Freeboard above Max Water Surface =		feet		Basin Volume at Top of Freeboard =		acre-ft

> Input with spillway design.

Routed Hydrograph Results

The user can override the default CUHP hydrographs and runoff volumes by entering new values in the Inflow Hydrographs table (Columns W through AF).

DETENTION BASIN OUTLET STRUCTURE DESIGN

MHFD-Detention, Version 4.04 (February 2021)

Summary Stage-Area-Volume-Discharge Relationships

The user can create a summary S-A-V-D by entering the desired stage increments and the remainder of the table will populate automatically.

The user should graphically compare the summary S-A-V-D table to the full S-A-V-D table in the chart to confirm it captures all key transition points.

Stage - Storage Description	Stage [ft]	Area [ft^2]	Area [acres]	Volume [ft^3]	Volume [ac-ft]	Total Outflow [cfs]

For best results, include the stages of all grade slope changes (e.g. ISV and Floor) from the S-A-V table on Sheet 'Basin'.

Also include the inverts of all outlets (e.g. vertical orifice, overflow grate, and spillway, where applicable).
