INTRODUCTION

PURPOSE AND SCOPE

The purpose of this Hydraulic Report is to summarize the channel design and drainage improvements to the West Tributary to the Falcon Basin drainage improvements (RWT054), (RWT092), (RWT080), (SR1), and (RWT094) for the Eagleview (“the Project”) for PT Eagleview LLC. The (RWT054 and RWT092) segments will be referred to as the North Channel and the (RWT094) segment will be referred to as the South Channel through the report. The proposed channel and drainage improvements include 10 drop structures, 6 rock chutes, and 1 sub-regional full spectrum detention pond. The proposed channel improvements begin at the north side of the Eagleview property and end approximately 3,400 feet to the south at the southern property line of the Eagleview property. The Project is located within the jurisdictional limits of El Paso County (“the County”). Therefore, the hydrologic and hydraulic design is based on the County’s criteria which is described in further detail within the report.

LOCATION

The Project is located approximately 4 miles northwest of Falcon, Colorado within Section 26, Township 12 South, Range 65 West of the 6th Principal Meridian, County of El Paso, State of Colorado (“the Site”). The Site comprises two parcels of land which are bound by Stapleton Estates Filing No. 1 on the west and south, Paint Brush Hills Filing No. 14 (PCD File No. SF2024) to the east, and the Rodgwick Subdivision and MFY Farm Subdivision to the north. A vicinity map has been provided in the **Appendix A** of this report.

The Site is currently owned by PT Eagleview LLC and will be developed by PT Eagleview LLC.

DESCRIPTION OF PROPERTY

The Site is approximately 121 acres consisting of undeveloped land with native vegetation and is classified as “Open Space” per Table 5-4 of the Drainage Criteria Manual of El Paso County. Vegetation within the site is characterized primarily by prairie grasses along with some area of scrub brush and a limited occurrence of small oaks. The Site does not currently provide water quality or detention for the Project area. The existing land use is undeveloped vacant land. There are no existing irrigation ditches on the Site.

The existing topography consists of slopes ranging from 1% to 20%. The west tributary of the Falcon drainage basin runs from the northwest corner of the site to the southeast corner of the Site.

The development of this site will include 38, 2 ½ acre single family lots, roadway improvements to the site will include mowing, clearing and grubbing, weed control, paved access road construction, roadway grading, one sub regional detention pond, two water quality features, roadside ditches, culverts, drainage swales, native seeding and a proposed channel to convey flows to the detention pond and water quality features.

PROJECT BACKGROUND

The Project is located within the West Tributary of the Falcon Drainage Basin and is within the Falcon Drainage Basin Planning Study completed by Matrix Design Group, September 2015 (DBPS). The watershed is generally located in the north central portion of El Paso County. The watershed contains three natural streams and has an overall area of approximately 10.6 square miles at the confluence of Black Squirrel Creek. The headwaters of the watershed are made up of ponderosa pine forest, grassland on undeveloped land, and 2-to-5-acre rural residential lots. The North and South channels are currently natural drainageways running through the Eagleview development. The DBPS identified drainage improvements within the project site. These improvements included grade control structures within the channel to help control velocities and degradation throughout the channel as well as, keeping the channel as natural as possible. In addition, to constructing a sub-regional detention pond onsite to provide water quality treatment and provide flood attenuation for the 100-year storm event. See **Appendix A** for excerpts from the DBPS. The North and South channels will maintain the existing channel alignments. The North Channel will be a trapezoidal section with 4:1 side slopes and maintain a channel slopes of 0.10% to 0.20%. To reduce velocities and keep the channel in a sub-critical flow regime. To achieve the 0.10% to 0.20% channel slopes, the North Channel is proposing 4 grouted boulder drop structures and 2 constructed riffle drops structures due to the steepness of the existing slopes in North Channel. The South Channel will also be a trapezoidal section with 4:1 side slopes and generally maintain a channel slope of 0.40% to reduce velocities and keep the channel in a sub-critical flow regime. To achieve the 0.40% channel slope, the South Channel is proposing 4 constructed riffle drops structures due to the steepness of the existing slopes in South Channel.

EXISTING SUB-BASIN DESCRIPTIONS

Historically the runoff from the Site drains into the West Tributary reach of the Falcon drainage basin. The West Tributary reach bisects the Site from north to south. The Site is located in upper portion of the Falcon drainage basin. Onsite and offsite flows generally flow from north to south overland over vacant and developed land to the West Tributary reach. The off-site basins draining to the site generally encompass rural land with pockets of residential development.

PROPOSED SUB-BASIN DESCRIPTIONS

For the onsite proposed drainage conditions, stormwater will generally maintain historic flow patterns from north to south. The proposed roadways will alter some of the existing flow paths. The roadway ditches will capture runoff from the roadways and direct flows back to the existing flow paths, which will ultimately outfall to existing natural drainage channels, sub regional pond, or water quality features. The off-site basins are fully developed and no changes to the upstream basins are anticipated. Refer to the Eagleview Final Drainage Report (SF-22-42) for existing and future hydrologic analysis that was used for the design of the overall drainage improvements for the Project.

PREVIOUS REPROTS

The following is a complete list of the existing reports pertaining to the Eagleview site analysis.

1. Falcon Drainage Basin Planning Study Selected Plan Report (DBPS), prepared by Matrix Design Group, September 2015. PCD File No. MP132.

2. Eagleview Subdivision Preliminary Drainage Report (PDR), prepared by Kimley-Horn, October 28, 2022. PCD File No. SP216.
3. Eagleview Subdivision Final Drainage Report (FDR), prepared by Kimley-Horn, under review.

DBPS DRAINAGE IMPROVEMENTS

The DBPS made recommendations for channels (RWT054), (RWT092), (RWT080), and (RWT094) onsite. The DBPS also identified a sub-regional detention pond (SR1) to be constructed onsite to provide water quality and flood attenuation. Refer to the DBPS excerpts in **Appendix A** specially sheets 6-16 and 6-17 for the locations of the DBPS recommendations mentioned above. These improvements were designed as part of the overall Eagleview development.

RWT054 is located on the north side of the site and is known as the North Channel. The future hydrologic calculations per the DBPS show 43 cfs for the 2-year flow and 480 cfs for the 100-year for this channel section. The hydrologic calculations prepared for the Eagleview development Final Drainage Report (FDR) were used for the design of the North and South channels. The 2-year flow of 77.6 cfs at design point P13 was used as the basis to size the low flow portion of the channel in reaches RWT054 and RWT092. Per MHFD criteria 70% of the 2-year flow (54.3 cfs) or 10% of the 100-year (375 cfs) flow determined from design point P13, whichever is greater is recommended to size the low flow portion of the channel. Therefore, the low flow channel was sized using 70% of the 2-year flow. The 100-year flow of 285 cfs from OB7 per the FDR was used to design reach RWT054. The alignment of this reach will remain in the same location. Grouted sloping boulder drops will be used within this reach as well as constructed riffle drops. The drop heights of the grouted sloping boulder drops range from 3.5' to 4' with 4:1 slopes. The drop heights of the constructed riffles are 3' with 4% slopes. A total of 3 grouted sloping boulder drop structures and 2 constructed riffles will be utilized within this reach. The channel sections outside of the drop structures within this reach will have a channel slope that ranges from 0.10% to 0.20% to reduce the potential of erosion.

RWT092 is located between RWT054 and the sub regional detention pond SR1. There is a flow change from reach RWT054 to RWT092. As mentioned above the low flow portion of the channel for both reaches RWT054 and RWT092 were sized using 70% of the 2-year which is 54.3 cfs. However, the two reaches were designed using the actual 100-year flow change occurring from reach RWT054 (285 cfs) to RWT (375 cfs). One grouted sloping boulder drop will be used within this reach as well as riprap rock chute that outfalls into the sub-regional pond SR1. The drop height of the grouted sloping boulder drop is 3.5' with 4:1 slope. The channel sections outside of the drop structure and rock chute within this reach will have a channel slope of 0.20% to reduce the potential of erosion.

RWT080 is located west of RWT092 refer to sheet 6-17 in **Appendix A** of the DBPS excerpts. The alignment of this reach will generally remain the same. This reach will have three riprap rock chutes with stilling basins to address head cutting and to provide erosion protection to reduce the potential of erosion. Downstream of rock chutes #3 and #4 turf reinforced matting (TRM) is being proposed to help with providing erosion protection to reduce the potential of erosion. Rock Cute #2 stilling basin will have dual function to help dissipate energy and function as a forebay. The rock chutes were size for the 100-year storm event utilizing hydrologic analysis performed in the FDR.

RWT094 is located south of the sub-regional detention pond SR1 and is known as the South Channel in this report. The future hydrologic calculations per the DBPS show 42 cfs for the 2-year flow and 510 cfs for the 100-year for this channel section. The hydrologic calculations prepared for the Eagleview development Final Drainage Report (FDR) were used for the design of the North and South channels. The 2-year flow of 77.5 cfs at design point P3 was used as the basis to size the low flow portion of the channel in this reach. Per MHFD criteria 70% of the 2-year flow (54.3 cfs) or 10% of the 100-year (404.3 cfs) flow determined from design point P3, whichever is greater is recommended to size the low flow portion of the channel. Therefore, the low flow channel was sized using 70% of the 2-year flow. The 100-year flow of 404.3 cfs from design point P3 per the FDR was used to design reach RWT094. The alignment of this reach will remain in the same location. A total of 4 constructed riffles will be utilized within this reach. The drop heights of the constructed riffles range from 2.3' to 3' with 3% to 4% slopes. The channel sections outside of the drop structures within this reach will have a channel slope of 0.40% to reduce the potential of erosion.

SR1 is generally located in the middle of the development between reaches RWT092 and RWT094. SR1 is a proposed sub-regional full spectrum detention pond which will provide 17.2 ac-ft of storage which is larger than the 11.03 ac-ft pond shown in the DBPS. SR1 will include three rock chutes #1, #2, and #6 with forebays to convey runoff into the pond. SR1 will also include a concrete trickle channel, outlet structure with a micro pool, 2-72" RCPs, emergency spillway, and a maintenance path. SR1 has been design to El Paso County's design criteria. Refer to the FDR detention pond and rock chute calculations.

HYDRAULIC ANALYSIS

The proposed channel design was modeled in HEC-RAS using flow rates based on the 2-, 10-, and 100-yr design storms. Flow rates were determined based on hydrologic analyses completed as a part of the Eagleview Subdivision Final Drainage Report and the results of that study are presented therein. The proposed channel was modeled as two distinct reaches (North Channel and South Channel) which are separated by the proposed extended detention basin. Upstream and downstream boundary conditions for both reaches were modeled based on the normal depth slope. A Manning's n value of 0.04 was assigned to the North Channel, both within the channel and on the overbanks. Where grouted sloped boulder and riffle drop structures are proposed, Manning's n values of 0.065 and 0.0395 were used, respectively. The Southern Channel was assigned a Manning's n value of 0.035 throughout the channel and overbanks and a Manning's n value of 0.0395 where riffle drop structures are proposed. There is no lateral variation in Manning's n values on the cross sections.

The North and South low flow channels are both designed to convey 70% of the 2-yr flow (55 cfs). Due to the constrained and sinuous nature of the North Channel, the low flow geometry consists of a 6-ft wide bottom and 3:1 side slopes while the South Channel low flow geometry consists of a 6-ft bottom and 4:1 side slopes. See FlowMaster cross sections for the low flow channels in the **Appendix B**. The North Channel cross section then transitions to a 3-ft bench at a 1% slope and then 4:1 side slopes to tie into the existing grade. Riprap armoring is proposed within the North Channel to ensure the stabilization of banks along curved lengths of channel. The South Channel becomes considerably wider than the North Channel and this allows for a larger bench of varying width at a 4% slope which transitions to a 4:1 side slope that ties into existing grades. The stated cross section geometries allow for a maximum channel depth of less than 5-ft, a Froude value of less than 0.8, and shear stress of less than 1.2 lb/sf throughout both channels. See **Table 1**, below for a description of all design parameters for the proposed

channels. Refer to **Appendix B** for drop structure and supporting HEC-RAS channel calculations.

Table 1: Hydraulic Design Parameters

Design Criteria	Design Value
Maximum 100-year depth outside of bankfull channel	5 ft
Maximum 100-year velocity, main channel	5 ft/s
Froude No., 100-year, main channel	0.8
Maximum Shear Stress, 100-year, main channel	1.2 lb/sf
Minimum bankfull capacity of bankfull channel (based on future development conditions)	70% of 2-year discharge or 10% of 100-year discharge, whichever is greater
Maximum overbank side slope	4(H):1(V)
Maximum bankfull side slope	2.5(H):1(V)

MAINTENANCE

Maintenance access for the proposed channel improvements is provided by proposed access roads adjacent to the North and South Channels. Access for the North Channel is provided from proposed Chemitra Trail and South Arroya Lane while access for the South Channel is provided from proposed South Arroya Lane. See the Construction Documents in Appendix C for the proposed locations of maintenance access roads.

Once construction of the proposed channel improvements are completed, maintenance of the channel will be the responsibility of El Paso County. Ownership of all drainage facilities within public rights-of-way shall fall to El Paso County, pending Board of County Commissioners approval.

FLOODPLAIN STATEMENT

There is no FEMA mapped floodplain on the project site. Refer to **Appendix A** for the Flood Insurance Rate Map (FIRM) number 08041C05350G effective date, December 7, 2018.

CONCLUSION

The Eagleview development lies within the West Tributary of the Falcon Basin Area Watershed. This report has been prepared in accordance with El Paso County stormwater criteria. It outlines the channel improvements onsite. The channel improvements are in general conformance with the DBPS. Additionally, the Site runoff and storm drain facilities will not adversely affect the downstream and surrounding developments.

NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The community map repository should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations (BFEs)** and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles and Floodway Data and/or Summary of Stillwater Elevations tables contained within the Flood Insurance Study (FIS) report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS report should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

Coastal Base Flood Elevations shown on this map apply only landward of 0.0' North American Vertical Datum of 1988 (NAVD88). Users of this FIRM should be aware that coastal flood elevations are also provided in the Summary of Stillwater Elevations table in the Flood Insurance Study report for this jurisdiction. Elevations shown in the Summary of Stillwater Elevations table should be used for construction and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures**. Refer to section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures for this jurisdiction.

The **projection** used in the preparation of this map was Universal Transverse Mercator (UTM) zone 13. The **horizontal datum** was NAD83, GRS80 spheroid. Differences in datum, spheroid, projection or UTM zones zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of this FIRM.

Flood elevations on this map are referenced to the **North American Vertical Datum of 1988 (NAVD88)**. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum**. Base Map information shown on this FIRM was provided in digital format by El Paso County, Colorado Springs Utilities, and Anderson Consulting Engineers, Inc. These data are current as of 2008.

This map reflects more detailed and up-to-date **stream channel configurations and floodplain delineations** than those shown on the previous FIRM for this jurisdiction. The floodplains and floodways that were transferred from the previous FIRM may have been adjusted to conform to these new stream channel configurations. As a result, the Flood Profiles and Floodway Data tables in the Flood Insurance Study Report (which contains authoritative hydraulic data) may reflect stream channel distances that differ from what is shown on this map. The profile baselines depicted on this map represent the hydraulic modeling baselines that match the flood profiles and Floodway Data Tables if applicable, in the FIS report. As a result, the profile baselines may deviate significantly from the new base map channel representation and may appear outside of the floodplain.

Corporate limits shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

Please refer to the separately printed **Map Index** for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.

Boulder Sizing

Boulder sizing for GSB drop structures constructed using the simplified method can be determined using Figure 9-1. For drop structures that do not meet the criteria for the simplified design method, the following procedure should be used to determine boulder size.

1. If the vertical distance from the drop toe to the drop crest is less than or equal to six feet, determine the critical velocity for the design flow in both the low-flow channel and the overbanks. This velocity occurs just upstream of the drop crest. For drop structures up to six feet in height, gradually varied flow acceleration is considered negligible. If the vertical distance from the drop toe to the drop crest is greater than six feet, determine the actual velocity at the drop toe using S2 curve drawdown calculations for the design flow in both the low-flow channel and the overbanks. This can be done using either the standard step or the direct step method. If a detailed hydraulic analysis has been completed using IHEC-RAS (see Section 2.3), then the actual velocity is provided in the IHEC-RAS output and the critical velocity can be taken from the section just upstream of the drop structure.
2. Calculate rock-sizing parameter, R_p (dimensionless), for both segments of the cross section (overbanks and in the low-flow channel):

$$R_p = \frac{VS^{0.17}}{(S_s - 1)^{0.66}} \quad \text{Equation 9-7}$$

Where:

V = critical velocity, V_c (for drop structure heights up to six feet) or drawdown velocity at the toe of the drop (for drop height exceeding six feet)

S = slope along the face of the drop (ft/ft)

S_s = specific gravity of the rock (Assume 2.55 unless the quarry certifies a higher value.)

Note that for drop heights exceeding six feet, Equation 9-7 becomes iterative, since Manning's roughness coefficient is a function of the boulder size, from Equation 9-1 or 9-2.

3. Select minimum boulder sizes for the cross-section segments within and outside the low-flow channel cross-section from Table 9-4. If the boulder sizes for the low-flow channel and the overbank segments differ, UDFCD recommends using only the larger sized boulders throughout the entire structure. Mistakes during construction are more common when specifying multiple rock sizes within the same structure.

Lane's Weighted Creep Method

The essential elements of Lane's method are as follows:

1. The weighted-creep distance through a cross section of a structure is the sum of the vertical creep distances, L_V (along contact surfaces steeper than 45 degrees), plus one-third of the horizontal creep distances, L_H (along contact surfaces less than 45 degrees).
2. The weighted-creep head ratio is defined as:

$$C_W = \frac{\left(\frac{L_H}{3} + L_V \right)}{H_S}$$

1. The weighted-creep distance through a cross section of a structure is the sum of the vertical creep distances, L_V (along contact surfaces steeper than 45 degrees), plus one-third of the horizontal creep distances, L_H (along contact surfaces less than 45 degrees).
2. The weighted-creep head ratio is defined as:

$$C_W = \frac{\left(\frac{L_H}{3} + L_V \right)}{H_S}$$

Equation 9-5

Where:

C_W = creep ratio

H_S = differential head between analysis points (ft)

Hydraulic Jump Length

2.3.5 Hydraulic Jump Length

After the hydraulic jump has been analyzed using the guidelines provided in Section 2.3.4, the jump length must be calculated. This will aid the designer in determining the appropriate stilling basin length and the need for additional rock lining downstream of the end sill. The following values are required to determine the hydraulic jump length:

y₂ = required depth of tailwater (feet)

F₁ = Froude Number = V₁(gy₁)^{-1/2} (based on depth and velocity at drop toe)

Use the above values to determine the length of the hydraulic jump (L) in Figure 9-4. Note that this figure is for horizontal channels, which is appropriate for most applications in the UDFCD region. Curves for sloping channels (from 5 to 25%) are in Chow, 1959.

¹Evaluation of Erosion at Channel Bends per MHFD USDCM Chapter 8 Equation 8-10

²RipRap for Mild Slope Conditions per MHFD USDCM Chapter 8 Equation 8-11

$$V_a = (-0.147 \frac{r_c}{T} + 2.176) V \quad \text{Equation 8-10}$$

Where:

V_a = adjusted channel velocity for riprap sizing along the outside of channel bends (ft/sec)

V = mean channel velocity for the peak flow of the major design flow (ft/sec)

r_c = channel centerline radius (ft)

T = Top width of water during the major design flow (ft)

8.1.1 Mild Slope Conditions

When subcritical flow conditions occur and/or slopes are mild (less than 2 percent), UDFCD recommends the following equation (Hughes, et al, 1983):

$$d_{50} \geq \left[\frac{VS^{0.17}}{4.5(G_s - 1)^{0.66}} \right]^2 \quad \text{Equation 8-11}$$

Where:

V = mean channel velocity (ft/sec)

S = longitudinal channel slope (ft/ft)

d_{50} = mean rock size (ft)

G_s = specific gravity of stone (minimum = 2.50, typically 2.5 to 2.7). Note: In this equation ($G_s - 1$) considers the buoyancy of the water, in that the specific gravity of water is subtracted from the specific gravity of the rock.

BOULDER PLACEMENT NOTES:
 1. PLACE BOULDERS WITH THE REQUIRED BOULDER HEIGHT VERTICAL. PLACE BOULDERS AS TIGHTLY TOGETHER AS POSSIBLE (WITHOUT TOUCHING) WHILE PROVIDING ENOUGH ROOM BETWEEN THEM TO THOROUGHLY VIBRATE THE GROUT AND TO ENSURE NO GAPS IN THE GROUT. THE SMALL DIMENSION OF A 2X4 CAN BE USED AS A GUIDE TO CHECK MINIMUM SPACING.
 2. BEFORE GROUING, CLEAN ALL DIRT AND MATERIAL FROM ROCK THAT COULD PREVENT THE GROUT FROM BINDING TO THE ROCK. KEEP BOULDERS FROM TOUCHING. AVOID SLIDING BOULDERS AGAINST SUBGRADE TO PROPERLY POSITION.
MATERIAL SPECIFICATIONS:
 1. ALL GROUT SHALL HAVE A MINIMUM 28-DAY COMPRESSIVE STRENGTH EQUAL TO 3200 PSI.
 2. ONE CUBIC YARD OF GROUT SHALL HAVE A MINIMUM OF SIX (6) SACKS OF TYPE II PORTLAND CEMENT.
 3. A MAXIMUM OF 25% TYPE F FLY ASH MAY BE SUBSTITUTED FOR THE PORTLAND CEMENT.
 4. THE AGGREGATE SHALL BE COMPRISED OF 70% NATURAL SAND (FINES) AND 30% 3/8-INCH ROCK (COARSE).
 5. THE GROUT SLUMP SHALL BE BETWEEN 4-INCHES TO 6-INCHES.
 6. AIR ENTRAINMENT SHALL BE BETWEEN 5.5% AND 7.5%.
 7. TO CONTROL SHRINKAGE AND CRACKING, 1.5 POUNDS OF FIBERMESH, OR EQUIVALENT, SHALL BE USED PER CUBIC YARD OF GROUT.
 8. COLOR ADDITIVE IN REQUIRED AMOUNTS SHALL BE USED WHEN SO SPECIFIED BY CONTRACT.
GROUT PLACEMENT SPECIFICATIONS:
 1. SPECIAL PROCEDURES SHALL BE REQUIRED FOR GROUT PLACEMENT WHEN THE AIR TEMPERATURES ARE LESS THAN 40°F OR GREATER THAN 90°F. CONTRACTOR SHALL OBTAIN PRIOR APPROVAL FROM THE DESIGN ENGINEER OF THE PROCEDURES TO BE USED FOR PROTECTING THE GROUT.
 2. GROUT SHALL BE DELIVERED BY MEANS OF A LOW PRESSURE (LESS THAN 10 PSI) GROUT PUMP USING A 2-INCH DIAMETER (MAXIMUM) NOZZLE.
 3. FULL DEPTH PENETRATION OF THE GROUT INTO THE BOULDER VOIDS SHALL BE ACHIEVED BY INJECTING GROUT STARTING WITH THE NOZZLE NEAR THE BOTTOM AND RAISING IT AS THE GROUT FILLS, WHILE VIBRATING GROUT INTO PLACE USING A PENCIL VIBRATOR.
 4. ALL GROUT BETWEEN BOULDERS SHALL BE TREATED WITH A BROOM FINISH.
 5. AFTER GROUT PLACEMENT, EXPOSED BOULDER FACES SHALL BE CLEANED AND FREE OF GROUT.
 6. ALL FINISHED GROUT SURFACES SHALL BE SPRAYED WITH A CLEAR LIQUID MEMBRANE CURING COMPOUND AS SPECIFIED IN ASTM C309.

NOTES:
 1. SOIL RIPRAP DETAILS ARE APPLICABLE TO SLOPED AREAS. REFER TO THE SITE PLAN ACTUAL LOCATION AND LIMITS.
 2. MIX UNIFORMLY 65% RIPRAP BY VOLUME WITH 35% OF APPROVED SOIL BY VOLUME PRIOR TO PLACEMENT.
 3. PLACE STONE-SOIL MIX TO RESULT IN SECURELY INTERLOCKED ROCK AT THE DESIGN THICKNESS AND GRADE. COMPACT AND LEVEL TO ELIMINATE ALL VOIDS AND ROCKS PROJECTING ABOVE DESIGN RIPRAP TOP GRADE.
 4. CRIMP OR TACKIFY MULCH OR USE APPROVED HYDROMULCH AS CALLED FOR IN THE PLANS AND SPECIFICATIONS.
 5. FOR TOE PROTECTION SEE DETAIL 10 ON THIS SHEET.

COBBLES SHALL BE FULLY EMBEDDED INTO THE MASS OF THE VOID-FILLED RIPRAP

NOTE: MIX PROPORTIONS ARE APPROXIMATE AND SUBJECT TO FIELD ADJUSTMENT BY THE ENGINEER OR OWNER

10 VOID-FILLED RIPRAP MIX NOTES _____ NTS

VOID-FILLED RIPRAP REPLACEMENT NOTES:

- LABORATORY TEST CERTIFICATES AND GRADATIONS FOR ALL MATERIALS INCLUDED IN THE VOID-FILLED RIPRAP MIX SHALL BE SUBMITTED FOR REVIEW. FOR THE 7-INCH MINUS CRUSHED SURGE AND THE 4-INCH MINUS PIT RUN SURGE MATERIALS, PROVIDE SAMPLES IN 5-GALLON BUCKETS FOR REVIEW.
- THE GOAL OF MIXING IS TO FILL THE VOIDS OF THE BASE RIPRAP MATERIAL WITHOUT DISPLACING THE RIPRAP. THE INTERLOCKING NATURE OF RIPRAP IN THE MIXED MATERIAL NEEDS TO REMAIN ESSENTIALLY THE SAME AS IF THE RIPRAP WAS PLACED WITHOUT VOID-FILLED MATERIAL.
- THE SPECIFIED MIX PROPORTIONS ARE NOTED AS APPROXIMATE BECAUSE THE TWO SURGE MATERIALS VARY SOMEWHAT BETWEEN DIFFERENT SUPPLIERS AND VARIATIONS IN GRAVEL PITS. THE SURGE MATERIALS ARE ONLY PROCESSED THROUGH ONE SCREEN SIZE (7-INCH MINUS OR 4-INCH MINUS), SO THE GRADATIONS VARY. IT IS IMPORTANT THAT THE DESIGN ENGINEER IS ON-SITE DURING THE MIXING OPERATION TO MAKE ADJUSTMENTS TO THE PROPORTIONS IF NECESSARY. THE AMOUNT OF COBBLES IN THE 4-INCH MINUS PIT RUN SURGE MATERIAL DICTATES THE ADDITION OR REDUCTION IN THE AMOUNT OF 2 TO 4-INCH COBBLE MATERIAL.
- VOID-FILLED RIPRAP MATERIAL CAN BE CHALLENGING TO PLACE BECAUSE IT HAS A TENDENCY TO SEGREGATE. THE FINER SANDS AND GRAVELS TEND TO SEPARATE FROM THE LARGER RIPRAP. CONTRACTORS SHALL TAKE CARE TO MINIMIZE SEGREGATION WHEN HAULING THE MIXED MATERIAL FROM STOCKPILE TO THE INSTALLATION LOCATION.
- THE LOOSE MATERIAL IS TO BE PLACED IN A SINGLE LIFT OR SUFFICIENT HEIGHT SUCH THAT FINAL GRADE WILL BE ACHIEVED UPON COMPACTION. IN MOST CASES, SOME ADDITIONAL MIXING WITH A TRACK EXCAVATOR IS NEEDED AFTER THE INITIAL PLACEMENT TO MAKE SURE THAT VOID-FILLED RIPRAP CONSISTS PRIMARILY OF THE SMALLER VOID-FILL MATERIALS. THE GOAL IS TO COMPLETELY FILL THE RIPRAP VOIDS WITHOUT DISPLACING THE RIPRAP. IN SOME CASES, ADDITIONAL VOID-FILLING MAY BE NECESSARY AFTER THE VOID-FILLED RIPRAP HAS BEEN PLACED BECAUSE THE FINES HAVE A TENDENCY TO MIGRATE TO THE BOTTOM. IN THESE SITUATIONS, A 50:50 MIXTURE OF THE PIT RUN AND TYPE II BEDDING CAN BE SPRINKLED ON THE SURFACE AND WASHED IN WITH WATER USING A HIGH PRESSURE HOSE TO FILL ANY SMALL VOIDS THAT MAY EXIST BELOW THE SURFACE. OTHER THAN FILLING VOIDS THAT MAY EXTEND DOWN INTO THE VOID-FILLED RIPRAP, NOT MUCH OF THIS MATERIAL SHOULD BE LEFT ON THE SURFACE, AS IT WILL WASH AWAY DURING RUNOFF EVENTS.
- AFTER THE VOID-FILLED RIPRAP MATERIAL HAS BEEN LOOSELY PLACED (PRIOR TO COMPACTION), A TOP DRESSING OF THE LARGE COBBLES CAN BE MIXED IN ON THE SURFACE FOR A MORE NATURAL RIVER BED LOOK, IF DESIRED. THIS IS USUALLY DONE BY SPRINKLING COBBLES SUCH THAT THEY COVER APPROXIMATELY 30-PERCENT OF THE SURFACE.
- THE LAST STEP IS TO COMPACT THE LOOSELY PLACED VOID-FILLED RIPRAP MATERIAL. WATER CAN BE ADDED, IF NECESSARY, SO THAT THE MOISTURE CONTENT OF THE MIXTURE IS AT OPTIMUM CONDITIONS DURING THE COMPACTION PROCESS.
- IT IS IMPORTANT THAT THE FINISHED TOP ELEVATIONS OF THE VOID-FILLED RIPRAP LAYER CLOSELY MATCH DESIGN GRADES TO WITHIN A TOLERANCE OF 0.10 FEET. HAVING TIGHT ELEVATION TOLERANCES HELPS TO MINIMIZE DEVELOPMENT OF FLOW CONCENTRATIONS. IF THE COMPACTED MATERIAL ENDS UP BELOW FINAL GRADE, IT IS NOT ACCEPTABLE TO ALLOW PLACEMENT OF ONLY THE SMALLER VOID-FILLED MATERIAL OR ADDITIONAL TOP DRESSING COBBLES TO ACHIEVE FINAL GRADE. IN SUCH CASES IT IS NECESSARY TO ADD MORE STANDARD SIZE VOID-FILLED RIPRAP MATERIAL AND REMIX THE ENTIRE THICKNESS OF ROCK TO ACHIEVE THE DESIGN SECTION. CONTRACTOR SHALL INSTALL A TEST SECTION OF THE VOID-FILLED RIPRAP MATERIAL AT THE BEGINNING OF THE PROJECT FOR REVIEW AND APPROVAL BY THE DESIGN ENGINEER.
