MEMORANDUM

DATE: September 9, 2022

TO: Arthur Gonzales – Access Manager

FROM: Jeffrey C. Hodsdon, P.E. - LSC Transportation Consultants, Inc.

SUBJECT: Ellicott Gas Station
RE: Traffic Impact Study
Response to CDOT Comments Memorandum
LSC #204481

Following are the LSC Transportation Consultants, Inc. responses to the January 12, 2022 CDOT Comments (posted to EDARP) regarding CS-21-002.

- a. *CDOT staff does not have any comments regarding the rezone of the fueling station from agricultural to commercial.*
- b. *A new CDOT Access Permit will be required for this development. Please contact CDOT, Arthur Gonzales, Access Manager to make application (719) 546-5732 or email arthur.gonzales@state.co.us.*

LSC Response: Comment noted.

- c. *A single point of access shall be granted for this development and secondary access to the site may not be allowed per the State Highway Access Code.*

LSC Response: Comment noted. The new/additional west access previously proposed for the site has been removed from the plan.

- d. Auxiliary lanes will be required for this development with highway widening and roadway improvements will also be required per the design standards of the State Highway Access Code.*

LSC Response: Comment noted. This project is at the rezone stage. Design of the access modifications and any associated highway improvements would occur at the site-development application. The updated TIS addresses the auxiliary turn-lane requirements based on the SHAC turning volume thresholds. However, the report contains the following note for consideration: Based on the planned net increase of one vehicle fueling position, and the associated trip-generation estimate, the use of the access would not increase by more than 20 percent, which is the typical threshold requiring a new access permit in Access Code section 2.6.3. Other provisions may apply, but generally when the proposed increase in vehicle volume will be less than 20 percent, changes in the use of the property are considered “minor modifications.”

- 1. Traffic Impact Study (TIS), dated December 17, 2020, is not signed and stamped. A signed and stamped copy should be provided before final approval.*

LSC Response: The TIS has been updated and has been signed & stamped.

- 2. The TIS refers to a school expansion and school peak hours in the Trip Generation paragraph on page 4 & 5. This should be corrected and resubmitted.*

LSC Response: Corrected in the updated TIS

- 3. The TIS is missing a reference in the 2040 Total Traffic Volumes paragraph on page 6. This should be corrected.*

LSC Response: Corrected in the updated TIS

- 4. The TIS states that it is not possible for trucks to circulate through the site with a single access. Evidence to support this claim has not been provided. The size of the parcel appears to be about 4 acres.*

LSC Response: The site plan has been revised. The new/additional west access previously proposed for the site has been removed from the plan.

- 5. There are two existing uses for this property – the gas station and a fire station. The TIS needs to include the gas station use, its access, and associated impacts. This information needs to be submitted.*

LSC Response: Comment noted. The updated TIS addresses this comment. Note: the TIS has been modified to remove the reference to a “fire station.” The building on the east side of the site is leased by the fire district for storage.

6. *The proposed modification of the existing access would not meet the standards of the State Highway Access Code (SHAC) regarding spacing from the intersection of SH94 and Ellicott Highway due to the required lengths of auxiliary lanes for acceleration and deceleration lanes.*

LSC Response: The site plan has been revised. The new/additional west access previously proposed for the site has been removed from the plan and TIS report. The TIS addresses auxiliary lanes.

7. *The access does not meet the one-half mile spacing standard for NR-A Highway for full movement accesses.*

LSC Response: Comment noted. Site access at half-mile spacing would not be feasible.

8. *Any new access would need to be a minimum of 400 feet from any other access which is not possible for this parcel unless an access is shared.*

LSC Response: The site plan has been revised. The new/additional west access previously proposed for the site has been removed from the plan and TIS report.

9. *The site plan provided shows a total of 4 proposed accesses: a one-way ingress next to a full movement driveway on the west side of the parcel and a one-way egress next to a full movement driveway near the east side of the parcel. Only one single point of access is allowed by the SHAC access should be allowed and only if it can meet the standards of the SHAC.*

LSC Response: The site plan and proposed access plan has been revised. Please refer to the "Access Plan" section of the TIS and Figure 2, which depicts a proposed access reconfiguration plan.

10. *Per the Hwy 94 Access Management Plan, the intersection of SH94 and Ellicott Highway is identified for signalization in the future. The TIS should analyze the impacts of queue lengths and other operational components of a future signal. Left turning outbound trucks would have to wait for a gap in westbound traffic generated by a future signal at the Ellicott Highway and then may be prevented from doing so due to a queue of eastbound traffic stopped at the signal.*

LSC Response: This comment has been addressed in the updated report. A queuing analysis has been added. Also, see the note on Figure 2 regarding the gas station access location.

11. *Due to the turning volumes, right and left turn deceleration lanes are required.*

LSC Response: The updated TIS addresses the auxiliary turn-lane requirements based on the SHAC turning volume thresholds. However, the report contains the following note for

consideration: Based on the planned net increase of one vehicle fueling position, and the associated trip-generation estimate, the use of the access would not increase by more than 20 percent, which is the typical threshold requiring a new access permit in Access Code section 2.6.3. Other provisions may apply, but generally when the proposed increase in vehicle volume will be less than 20 percent, changes in the use of the property are considered “minor modifications.”

- 12. Right turn and left turn acceleration lanes are required due to the traffic volume on the highway, the posted speed of 45 MPH and the new trips generated by trucks.*

LSC Response: A left-turn acceleration lane is not feasible given the proximity of the downstream intersection of Ellicott Highway/SH 94. Please refer to the response to comment no. 11 above.

- 13. A revised site plan with access that meets the standards of the SHAC needs to be provided.*

LSC Response: The site plan and proposed access plan has been revised. Please refer to the “Access Plan” section of the TIS and Figure 2, which depicts a proposed access reconfiguration plan.

Ellicott Gas Station
Traffic Impact Study Update
PCD File No.: CS-21-002
(LSC #204481)
September 8, 2022

Traffic Engineer's Statement

This traffic report and supporting information were prepared under my responsible charge and they comport with the standard of care. So far as is consistent with the standard of care, said report was prepared in general conformance with the criteria established by the County for traffic reports.

Developer's Statement

I, the Developer, have read and will comply with all commitments made on my behalf within this report.

RE: Ellicott Gas Station
Traffic Impact Study
El Paso County, Colorado
LSC #204481
PCD File No. CS-21-002

Dear Mr. Thurston,

In response to your request, LSC Transportation Consultants, Inc. has prepared this updated traffic impact study (TIS) for the proposed rezone of the parcel located at 23580 Highway 94 in the Ellicott area of El Paso County, Colorado (El Paso County parcel no. 3412000015). As shown in Figure 1, the site is located on the north of State Highway (SH) 94 approximately 250 feet west of the intersection of SH 94/Ellicott Highway.

The purpose of the rezone is to expand the existing Fuel B's gas station & convenience store business by adding new diesel fuel pumps and removing the existing diesel fuel pump. The net increase would be **one** diesel fueling position. The prior site plan submitted showed an additional access point to State Highway 94 (SH 94). In response to Colorado Department of Transportation (CDOT) comments, the site plan has been revised, and the second access has been removed from the plan.

REPORT CONTENTS

The preparation of this report included the following:

- An inventory of existing roadway and traffic conditions on the adjacent and nearby roadway system, including surface conditions, functional classification, widths, pavement markings, traffic control signs, posted speed limits, intersection and access spacing, roadway and intersection alignments, roadway grades, and auxiliary turn lanes;

- Updated weekday morning and afternoon peak-hour turning-movement traffic counts at the intersections:
 - SH 94/Ellicott Highway
 - Existing site access
- CDOT annual average daily traffic and estimated current average weekday traffic (AWT) volumes on the study area streets;
- Projections of 20-year background traffic volumes on the study-area streets;
- The proposed site expansion and access plan;
- Estimates of average weekday and weekday peak-hour trip generation for the proposed gas station expansion;
- Assignment of the site-generated traffic to the roadway network;
- Projected resulting total peak-hour intersection traffic volumes at the intersections:
 - SH 94/Ellicott Highway
 - Existing site access to SH 94
- Projected total daily (AWT) volumes on the study area streets;
- Intersection level of service analysis at the study intersections for both background and total traffic scenarios;
- Queuing analysis and auxiliary turn-lane analysis at the site access; and
- Findings and recommendations;

RECENT TRAFFIC REPORTS

The following traffic reports were utilized in the preparation of this report:

- The prior version of this TIS report: “Ellicott Gas Station” by LSC (December 2020)
- SH 94 Access Management Plan, 2012
- “Ellicott Town Center Rezone” by LSC (June 2020)

LAND USE

Figure 1 shows the site location relative to the adjacent and nearby streets and roadways. As shown, the gas station is located on the north side of SH 94 approximately 250 feet west of the intersection of SH 94/Ellicott Highway. The gas station currently has 10 vehicle fueling positions with a convenience store and fast food. The proposed expansion would involve construction of three new diesel fueling positions, while the existing diesel pump (two fueling positions) would be removed (for a net increase of 1 new fueling position). No building expansion is proposed. The updated site plan is shown in Figure 2.

The parcel to the west of the site has been developed for a liquor store and a Subway. Immediately to the east on the same parcel is a building leased by the Ellicott Fire Protection District. It is our understanding that this building is used for storage.

ACCESS PLAN

The combined gas station and fire district building existing access point is currently about 165' wide, the west edge of which is about 440 feet west of the centerline of the SH 94/Ellicott Highway intersection. The revised site plan shows a proposed new west edge of the gas station access at 375 feet west of the centerline of the SH 94/Ellicott Highway intersection. The plan shows the access width for the gas station narrowed to 40 feet. The centerline spacing from SH 94/Ellicott Highway intersection would be 355 feet. The plan shows the proposed reconfiguration of the wide access for the gas station and a separate access for the fire district centered on the front of the fire station. The plan shows separate fire district access point because placement of the gas station access to allow for trucks to enter, circulate within, and exit the gas station site would create a more difficult and cumbersome ingress and egress for the storage building.

Please refer to notes on Figure 2 regarding the proposed access reconfiguration plan.

STUDY AREA BOUNDARIES

The study area is the site frontage of SH 94 (including the access), east to and including the intersection of SH 94/Ellicott Highway.

EXISTING ROAD AND TRAFFIC CONDITIONS

Figure 1 shows the streets adjacent to and in the vicinity of the site. Adjacent streets serving the site are identified below followed by a brief description of each:

State Highway 94 is generally a two-lane, paved rural highway in this area of El Paso County with a posted speed limit of 55 miles per hour (mph) adjacent to the site. The highway extends east from US Highway 24 near Peterson Air Force Base for about 85 miles to Highway 287 in Cheyenne County.

CDOT has identified the governing document with respect to access management for SH 94 in the vicinity of the site as the *State Highway 94 Access Management Plan (2012)*. SH 94 is a three-lane roadway in the vicinity of the site and is classified as NR-A (non-rural principal arterial) adjacent to the site. There is a single through lane in each direction and a two-way left-turn center lane. The posted speed limit is 45 miles per hour (mph) adjacent to the site.

The El Paso County 2040 *Major Transportation Corridors Plan (MTCP)* identifies SH 94 as a two-lane Principal Arterial adjacent to the site. The *MTCP 2060 Corridor Preservation Plan* identifies SH 94 as a future four-lane Principal Arterial. However, future right-of-way needs will be identified by CDOT.

Ellicott Highway is classified as a two-lane Minor Arterial on the 2040 El Paso County *MTCP*. Posted speed limits adjacent to the site are 55 mph and 45 mph north and south of SH 94,

respectively. Auxiliary left-turn lanes currently exist on the eastbound and westbound approaches at the TWSC intersection of Ellicott Highway/State Highway 94.

Existing Traffic Volumes

Figure 3 shows the results of morning and afternoon peak-hour traffic-volume counts conducted in March and June 2022 at the intersections of SH 94/Ellicott Highway and the gas station site access, along with existing lane geometries and traffic controls. CDOT data indicates that heavy vehicles make up approximately 7 percent of the traffic during the morning and afternoon peak hours.

Pedestrian, Bicycle and Public Transit Access

There are no sidewalks along SH 94 or Ellicott Highway in the vicinity of the site. In the El Paso County *Major Transportation Corridors Plan Update*, it is shown that a regional trail is planned adjacent to SH 94. Additionally, the plan showed Ellicott Highway south of SH 94 is a proposed bicycle route.

There are no Mountain Metropolitan public transit routes in the vicinity of the site.

FUTURE BACKGROUND CONDITIONS

Background traffic is traffic that is anticipated to occur without the addition of the proposed development. Figure 8 shows the projected long-term background traffic volumes for the year 2042. Traffic from the proposed gas station expansion is not included in the 2042 background traffic volumes.

The planned Mayberry Town Center (formerly called “Ellicott Town Center”) development site is located west of the site. Future traffic projections from the most recent comprehensive TIS report for that project have been used in this report. The Colorado Department of Transportation (CDOT) 20-year growth factor for SH 94 along this segment of highway is 1.19. Use of this growth factor would result in lower estimates than those shown in Figure 8. In order to be conservative, LSC aligned long-term traffic volumes at SH 94/Ellicott Highway in this study with those from the “Ellicott Town Center Rezone” report (submitted in June 2020).

TRIP GENERATION

Short Term

Estimates of the vehicle trips currently being generated and projected to be generated in the short term following the site expansion were developed using counts recorded at the existing gas station. Traffic counts conducted at the site access were used to develop current trip-generation rates, based on the existing number of fueling positions (ten). Then those rates were used to

forecast how much traffic would be generated with the proposed net one additional fueling position (factored by 1.1).

Table 1 provides the existing traffic generated by the gas station during the morning and afternoon peak hours.

Table 1: Existing Site Vehicle-Trip Generation for 10 Fueling Pumps (Based on LSC Count Data)

Analysis Period	Weekday		
	In	Out	Total
Morning Peak Hour	63	64	127
Afternoon Peak Hour	72	64	136

Table 2 provides the increase in site-generated traffic projected to occur with the additional pumps. A detailed short-term trip-generation estimate for the gas station, including calculated trip-generation rates, is presented in Table 5 (attached).

Table 2: Estimated Increase in Site Vehicle-Trip Generation for Additional Fueling Pumps

Analysis Period	Weekday		
	In	Out	Total
Morning Peak Hour	6	6	12
Afternoon Peak Hour	7	6	13

The proposed gas station expansion is projected to generate approximately 12 additional vehicle trips during the morning peak hour and 13 additional vehicle trips during the afternoon peak hour.

Long Term

Estimates of the vehicle trips projected to be generated by the proposed gas station site have been made using nationally-published trip-generation rates from *Trip Generation, 11th Edition, 2021* by the Institute of Transportation Engineers (ITE). ITE land-use code “945 – Convenience Store/Gas Station (2.0 – 4.0 KSF)” has been used to estimate trip generation for the site.

Table 3 provides the existing traffic generated by the gas station during the morning and afternoon peak hours. These trip generation totals include combined counts for the existing gas station and adjacent fire station.

**Table 3: Future “Baseline” Site Vehicle-Trip Generation for 10 Fueling Pumps
(Based on ITE-Rate-Based Estimates)**

Analysis Period	Weekday		
	In	Out	Total
Morning Peak Hour	85	85	170
Afternoon Peak Hour	93	93	186

Table 4 provides the increase-above-baseline site-generated trips projected to occur with the additional pumps. A detailed long-term trip-generation estimate for the gas station, including calculated trip-generation rates, is presented in Table 5 (attached).

**Table 4: Estimated Increase-Above-Baseline in Site Vehicle-Trip Generation for 3 Additional Fueling Pumps
(ITE-Rate-Based Estimates)**

Analysis Period	Weekday		
	In	Out	Total
Morning Peak Hour	9	9	18
Afternoon Peak Hour	9	9	18

The proposed gas station expansion is projected to generate 18 additional vehicle trips during the morning peak hour and 18 additional vehicle trips during the afternoon peak hour.

Pass-By Trips

A large percentage of gas station traffic is typically from pass-by traffic. Based on the ITE “Trip Generation Handbook,” it is anticipated that approximately 75 percent of the traffic generated by the additional gas pumps will be pass-by trips. These trips are not new to the adjacent roadway but are new to the site access.

A pass-by trip is one made by a motorist who would already be on an adjacent road regardless of the proposed development, but who stops in at the site while passing by. That pass-by motorist would then continue on his or her way to a final destination in the original direction. Figure 4 (attached) shows the percent of the trips generated that were assumed to be pass-by trips. The pass-by trip percentage of 76 percent has been based on data from the *Trip Generation Handbook – An ITE Proposed Recommended Practice, 3rd Edition, 2014* by ITE.

TRIP DISTRIBUTION AND ASSIGNMENT

Estimating the directional distribution of site-generated vehicle-trips to the study-area roads and intersections is a necessary component in determining the site’s traffic impacts. Figure 4 shows

the percentages of the site-generated vehicle trips projected to be oriented to/from each approach to the site. Pass-by trip splits/percentages have also been estimated. Estimates have been based on the directional distribution of existing traffic.

Site-generated traffic volumes have been estimated at the study intersections, as shown in Figure 5 and Figure 6. These volumes have been calculated by applying directional distribution percentages to the trip-generation estimates (from Table 5, attached). Both non-pass-by trips and pass-by trips are provided in the figure. The figures show both the estimated increases/additional site-generated trips resulting from the expansion, as well as the resulting total site-generated trips assuming the site expansion ("build" scenario).

TOTAL TRAFFIC

Short-Term Total Traffic Volumes

Figure 7 shows the sum of the existing traffic volumes (from Figure 3) and the additional trips due to three additional pumps (shown in Figure 5). These volumes represent the projected short-term total traffic following the construction of the additional pumps. Laneage and traffic control at the study-area intersections are also shown in this figure.

2042 Total Traffic Volumes

Figure 9 shows the sum of the long-term baseline (from Figure 8) and the long-term site-generated peak-hour traffic volumes (shown in Figure 6). The long-term future total trips are essentially an estimate based on ITE Trip Generation rates for an 11-pump gas station/convenience store. These volumes represent the projected long-term total traffic following the construction of the additional pumps. Laneage and traffic control at the study-area intersections are also shown in this figure.

LEVEL OF SERVICE ANALYSIS

The following intersections have been analyzed to determine the projected intersection levels of service for short- and long-term background and total traffic scenarios for the morning and afternoon peak-hour periods:

- SH 94/Ellicott Highway
- Site access point

Level of service (LOS) is a quantitative measure of the level of congestion or delay at an intersection and is indicated on a scale from "A" to "F." LOS A is indicative of little congestion or delay. LOS F indicates a high level of congestion or delay. Table 3 shows the level of service delay ranges for signalized and unsignalized intersections.

Table 3: Intersection Levels of Service Delay Ranges

Level of Service	Signalized Intersections	Unsignalized Intersections
	Average Control Delay (seconds per vehicle)	Average Control Delay (seconds per vehicle) ⁽¹⁾
A	10.0 sec or less	10.0 sec or less
B	10.1-20.0 sec	10.1-15.0 sec
C	20.1-35.0 sec	15.1-25.0 sec
D	35.1-55.0 sec	25.1-35.0 sec
E	55.1-80.0 sec	35.1-50.0 sec
F	80.1 sec or more	50.1 sec or more
(1) For unsignalized intersections, if V/C ratio is greater than 1.0 the level of service is LOS F, regardless of the projected average control delay per vehicle.		

LOS values have been included on each figure for each turning movement/approach during the weekday morning and evening peak hours for the proposed site access intersections and off-site intersections in the study area:

- Figure 3: Existing Traffic, Lane Geometry, Traffic Control, and LOS
- Figure 7: Existing + Site Traffic, Lane Geometry, Traffic Control, and LOS
- Figure 8: 2042 Background Traffic, Lane Geometry, Traffic Control, and LOS
- Figure 9: 2042 Background + Site Traffic, Lane Geometry, Traffic Control, and LOS

LOS calculations for long-term scenarios were based upon the recommended lane geometries and traffic controls outlined in the figures above.

SH 94/Site Access

All turning movements at the intersection of SH 94/site access currently operate at and are projected to remain LOS C or better during all peak hours through the long term, with or without the additional site traffic. Analysis assumes that a westbound right-turn deceleration lane would be constructed on SH 94 at the site access.

SH 94/Ellicott Highway

Short Term

All individual turning movements and single-lane approaches at SH 94/Ellicott Highway currently operate at and would continue to operate at LOS C or better during both short-term peak hours, with or without additional site-generated traffic. Short-term analysis assumed no modifications would be made to existing lane geometries and traffic control at this intersection.

Long Term

If the intersection of SH 94/Ellicott Highway were to remain two-way stop-sign controlled during the long term, the northbound and southbound single-lane approaches would operate at LOS F during at least one peak hour, with or without additional site-generated traffic. However, all individual turning movements would improve to LOS B or better if the intersection were to be signalized or converted to a roundabout in the long term, as summarized in the attached figures and Synchro reports.

Signal Warrants

Based on the existing-plus-site volumes, the threshold for an hourly time period of the Four-Hour Volume traffic-signal warrant would not be exceeded during the AM or late afternoon peak hours (two hours of the day). By 2042, the projected background and total volumes are projected to exceed these thresholds. The addition of one net additional diesel fueling position on this site would have minimal impact on the side-street approach volumes.

QUEUING ANALYSIS

Eastbound Approach at the SH 94/Ellicott Highway Intersection

If the intersection of SH 94/Ellicott Highway were to be signalized during the long term, queues on SH 94 would extend back from Ellicott Highway towards the site access during the red phase of each cycle. The centerline spacing between the proposed site-access location and the SH 94/Ellicott Highway intersection would be 355 feet. Queues exceeding 355 feet would block the site access. Synchro reports indicate that the 95th-percentile queue length for any of the projected future eastbound turn lanes would not exceed 58 feet during either peak hour. As such, queues on the eastbound approach would **not** block the access or hamper the ability for traffic to turn southbound-left out of the site and head east if SH 94/Ellicott Highway were to be converted to a signalized intersection.

Eastbound Left Turn at the Site Access

There currently exists a two-way left-turn lane on SH 94 adjacent to the site. This allows eastbound left-turning vehicles to move out of the through lane for queuing prior to turning into the site. The queuing analysis shows that none of the left-turning movements into the site are anticipated to have a 95th percentile queue length exceeding 25 feet.

AUXILIARY LANES

SH 94/Site Access

Note: Based on the planned net increase of one vehicle fueling position, and the associated trip-generation estimate, the use of the access would not increase by more than 20 percent, which is the typical threshold requiring a new access permit in Access Code section 2.6.3. Other provisions may apply, but generally when the proposed increase in vehicle volume will be less than 20 percent, changes in the use of the property are considered “minor modifications.”

The proposed site-access location relative to Ellicott Highway does not meet the one-half mile spacing standard for NR-A highways for full-movement accesses. Any new access would need to be a minimum of 400 feet from any other access, which is not possible for this parcel. The prior site plan has been modified to maintain the single access to the gas station/convenience store. This access is shown about 400 feet east of the access to the north side to the property to the west.

The plan shows separate fire station access point because placement of the gas station access to allow for trucks to enter, circulate within, and exit the gas station site would create a more difficult and cumbersome ingress and egress for fire station vehicles.

Westbound-Right Deceleration Lane

Based on current traffic volumes, the site access meets the minimum threshold to require a westbound right-turn lane. The Access Code requirement for a westbound right-turn lane is 435 feet in length, which includes a taper of 165 feet. The spacing between this access and the intersection of SH 94/Ellicott Highway is not adequate for a full-length turn lane with taper.

Westbound-Right Acceleration Lane

Per CDOT criteria, a westbound right-turn acceleration lane is required on NR-A classified roadways with an egress volume exceeding 50 vehicles per hour (vph). As shown on the figures, the southbound-right volume exiting the site would exceed this 50-vph threshold. The Access Code criteria indicates this movement requires a 550-foot acceleration lane, consisting of 388 feet of full-width lane length plus a 162-foot transition taper (13.5-to-1 ratio).

Eastbound-Left Turn Deceleration Lane

There currently exists a two-way left-turn lane on SH 94 adjacent to the site-access point. This functions as the left-turn lane into the site. The roadway is striped for a two-way center left-turn lane due to the numerous access points on both sides of the highway through this section.

SH 94/Ellicott Highway

The westbound right turn to the SH 94/Ellicott Highway intersection currently exceeds the minimum threshold for requiring a right-turn lane. This movement requires a 435-foot deceleration lane, which includes a taper of 162 feet (13.5-to-1 ratio).

A potential future signal or roundabout was called out for the SH 94/Ellicott Highway intersection in the Ellicott Town Center TIS report. Please refer to Figure 8 and Figure 9 for potential future additional auxiliary turn lanes at this intersection, including conceptual-level future laneage with lane geometry arrows.

CONCLUSIONS AND RECOMMENDATIONS

Trip Generation

- During the short term, the site is projected to generate approximately 12 new morning peak-hour trips, with 6 inbound and 6 outbound. Approximately 13 new afternoon trips (7 additional inbound and 6 additional outbound) would be generated during the short term. Approximately 75 percent of these trips will be pass-by trips.
- During the long term, the site is projected to generate approximately 18 new morning peak-hour trips, with 9 inbound and 9 outbound. Approximately 18 new afternoon trips (9 inbound and 9 outbound) would be generated during the long term. Approximately 75 percent of these trips will be pass-by trips.

Level of Service

- All individual turning movements at the unsignalized intersection of SH 94/Ellicott Highway are projected to operate at LOS C or better during both short-term peak hours, with or without the proposed gas station expansion.
- If SH 94/Ellicott Highway were to remain two-way stop-sign controlled during the long term, the northbound and southbound single-lane approaches would operate at LOS F during at least one peak hour, with or without the proposed gas station expansion. However, all individual turning movements and approaches would operate at LOS C or better during the long term if this intersection were to be signalized or converted to a roundabout, with or without the proposed gas station expansion.
- All individual turning movements at the site access are projected to operate at LOS C or better during both peak hours in the short-term and long-term scenarios.

Site Access and Potential Improvements

- Based on the planned net increase of one vehicle fueling position, and the associated trip-generation estimate, the use of the access would not increase by more than 20 percent, which is the typical threshold requiring a new access permit in Access Code

section 2.6.3. Other provisions may apply, but generally when the proposed increase in vehicle volume will be less than 20 percent, changes in the use of the property are considered "minor modifications."

- Please refer to the "Access Plan" section and Figure 2, which depicts a proposed access-reconfiguration plan.
- Please refer to the "Auxiliary Lanes" section above for Access Code thresholds for auxiliary turn lanes with respect to the projected volumes.

¹ VFP = vehicle fueling positions

² Source: *Trip Generation, 11th Edition (2021)* by the Institute of Transportation Engineers (ITE)

³ Source: *Trip Generation Handbook - An ITE Recommended Practice, 3rd Edition (2017)* by ITE

⁴ Assumes ratio of 1.1 would be applied to existing entering and exiting counts during the future, as 11 vph/10 vph = 1.1

Figures

1" = 200'
scale

An aerial photograph of a fuel station site with various annotations. The main building is outlined in blue. To its right is a smaller storage building. Several callout boxes provide details about proposed and existing features. A yellow line indicates a proposed narrowing of an access opening at the intersection with State Highway 94. Various survey points are labeled around the perimeter of the site.

EXHIBIT

ELLCOTT FUEL STATION

DATE PRINTED: May 18, 2022

No change to building size is proposed

Proposed new:
Maximum of 3
new vehicle
fueling
positions -
diesel fuel only

Existing gas fueling
positions under the
canopy to remain

4 pumps,
8 fueling positions

The existing pump
south of the existing
canopy to be
removed when the
proposed new
pumps are added.

Existing storage
building
(to remain)

Separate storage building access
(potential width and/or curbed
access "opening" for this access could
be discussed with the fire district,
which uses the building for storage).

Intersection Summary

Area Type: Other

Cycle Length: 60

Actuated Cycle Length: 60

Offset: 23.5 (39%), Referenced to phase 2:NBTL and 6:SBTL, Start of Yellow

Natural Cycle: 50

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.56

Intersection Signal Delay: 12.6

Intersection LOS: B

Intersection Capacity Utilization 48.5%

ICU Level of Service A

Analysis Period (min) 15

Splits and Phases: 3: Ellicott Hwy & SH 94

Intersection Summary

Area Type: Other

Cycle Length: 60

Actuated Cycle Length: 60

Offset: 23.5 (39%), Referenced to phase 2:NBTL and 6:SBTL, Start of Yellow

Natural Cycle: 50

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.59

Intersection Signal Delay: 13.6

Intersection LOS: B

Intersection Capacity Utilization 57.3%

ICU Level of Service B

Analysis Period (min) 15

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Splits and Phases: 3: Ellicott Hwy & SH 94

Intersection Summary

Area Type: Other

Cycle Length: 60

Actuated Cycle Length: 60

Offset: 23.5 (39%), Referenced to phase 2:NBTL and 6:SBTL, Start of Yellow

Natural Cycle: 50

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.59

Intersection Signal Delay: 13.7

Intersection Capacity Utilization 58.0%

Analysis Period (min) 15

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

Splits and Phases: 3: Ellicott Hwy & SH 94
