> Please note the SDP cannot be approved until the replat is recorded.

PCD#: TBD Meridian Storage Site Development Plan 9/8/23

REQUEST

Galloway, on behalf of Meridian Storage LLC, requests approval of a Site Development Plan on approximately 9.61 Acres west of the intersection of Meridian Road and Owl Place. The Site Development Plan proposes a self-storage facility on Lot 1 and RV Storage (85 spaces) on Lot 2.

SITE DESCRIPTION

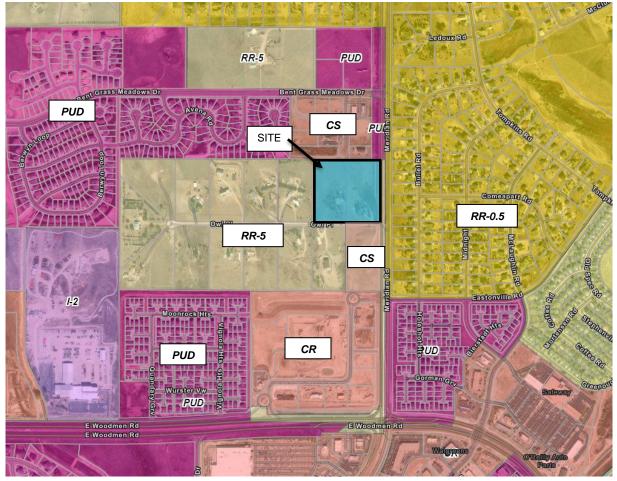

Location & Land Use

The Project is in El Paso County west of Meridian Road a divided, 4 lane road with commercial and residential uses and north of Owl Place. A dental clinic and a veterinary clinic are located directly north, residential lots are located to the west and existing/future commercial to the south. Lot 1 and 2 are currently vacant with residential buildings on the properties. The properties slope from the north to the south. The site is mostly native prairie grassland and weeds with trees sparsely located around the site.

Zoning:

The property is proposed to be zoned as CS and is currently awaiting final approval by the Board of County Commissioners. The property west is zoned RR-5. The property to the south recently was rezoned to CS. The properties to the north are zoned CS. The residential area to the east is zoned RR-0.5.

PROJECT DESCRIPTION & CONTEXT

This Site Development Plan is requested to facilitate the development of a self-storage facility and RV storage. As the area surrounding the original Falcon Ranchettes subdivision has developed, the land uses have redeveloped into a more intense urban development that utilizes urban services. The proposed self-storage and RV storage matches the urban character and intensity while accommodating the increase in population with commercial services. The intended self-storage and recreation vehicle storage would provide additional commercial services to the growing neighborhoods in the Falcon area.

Both parcels are owned by the applicant Mike D. Texer. The subject property is currently vacant and surrounded by a mix of residential and commercial uses. A lighting plan has been provided with the Site Development Plan set. Overall site lighting includes 20' site pole fixtures and building mounted. All fixtures will be downcast. Landscape screening and buffering measures are proposed to enhance aesthetics and reduce visual impacts. Evergreen trees and shrubs are strategically placed to mitigate impacts from parked vehicle

PCD#: TBD Meridian Storage Site Development Plan 9/8/23

headlights to the residential lots to the west. The development will meet all building setback and maximum lot coverage requirements as shown on the Site Development Plan Site Plan.

DEFINITION OF PROPOSED USE AND SPECIFIC DEVELOPMENT STANDARDS Definition:

Mini-Warehouses are permitted in the CS zone district, and are defined as:

"Buildings designed primarily for the storage of household items and inventory of small commercial businesses where storage units are individually leased or rented, where access to storage units is infrequent, and where no utilities are provided except for the service of a manager's apartment and for lighting and climate control of individual storage units."

Automobile and Boat Storage Yards are permitted in the CS zone district, and are defined as:

"A lot, parcel, or structure used for temporary storage of operable automobiles, trucks under 5 tons rated capacity, campers, recreational vehicles, trailers, or boats, not owned by the property owner, where typically the storage occurs when they are not in use and for a fee. The term shall not include scrap metal processing yards, vehicle dismantling yards, or salvage yards."

Specific Development Standards:

While there are no specific development standards for mini-warehouses, such use is permitted in the CS zone district.

Automobile and boat storage yards are subject to the following specific development standard:

- Display and storage areas shall be on a surface approved by the applicable fire department.

UTILITIES

Electric:

Electric service will be provided by Mountain View Electric. A commitment letter was included with the replat application. In the letter, Mountain View Electric states that these services are available to meet the demands of the new development.

Water:

The proposed self-storage facility will be served by a central water supply system provided by Woodmen Hills Metropolitan District. A commitment letter was included with the replat application.

Wastewater:

The proposed self-storage facility will be served by a central sanitary sewer system provided by Woodmen Hills Metropolitan District. A commitment letter was included with the replat application.

Natural Gas:

Natural gas service will be provided by Colorado Springs Utilities. A commitment letter was included with the replat application. In the letter, CSU states that these services are available to meet the demands of the new development.

PCD#: TBD Meridian Storage Site Development Plan 9/8/23

ACCESS AND TRAFFIC

Access:

Upon completion, the proposed site will have two full movement accesses. One access will be located along Owl Place. Meridian Park Drive will be extended to the south, where it will provide a second access to the site.

Traffic:

A Traffic Impact Study (TIS) was submitted for this site as part of the rezone and replat applications. The TIS provides recommendations for improvements to existing surrounding streets that will support this development. The TIS analyzed the proposed development of 158 storage units and 95 RV storage spaces and determined the development will generate approximately 46 daily weekday trips. The site will generate 3 morning peak hour trips and 4 afternoon peak hour trips. The TIS found that the project will have minimal effect on the existing and future roadway network and any recommendations to improve failing intersections are the responsibility of El Paso County to be implemented.

PARKING

Parking requirements for mini-warehouses are based on the number of storage units and number of employees. The development consists of 158 storage units and will have a maximum of 1 employee on the premises. The Land Development Code requires 1 space per 100 units, plus 1 space per employee. Therefore, a total of 3 parking spaces are required. The development provides a total of 4 parking spaces, including 1 ADA van accessible space. The development will also provide 95 recreational vehicle storage spaces to rent for long-term storage.

STORMWATER

There is an existing stormwater conveyance ditch on the east property line of the site that conveys flows from north to south along Meridian Road. As a part of this development, it is proposed to capture and route the off-site flows via conduit through the site, matching the existing outfall location. All on-site stormwater will be captured and conveyed to the on-site water quality and detention pond, where stormwater will be treated and released in accordance with County standards, following historic drainage patterns. All on-site drainage improvements will be owned and maintained by the owner of the development.

A Final Drainage Report is included with this submittal. The purpose of this report is to:

- 1. Identify on-site and off-site drainage patterns.
- 2. Design storm water facilities to collect and convey storm runoff from the proposed development to appropriate discharge and/or detention locations.
- 3. Design water quality and detention facilities to control discharge release rates to below historic.
- 4. Demonstrate compliance with surrounding major drainage basin planning studies, master development drainage plans, and flood insurance studies.

ENVIRONMENTAL

Wetlands & Floodplain:

There are no wetlands within the project boundaries. The site is located in Zone X (FEMA Floodplain Map No. 08041C0553G dated December 7, 2018), indicating the flood risk of the site is deemed by FEMA to be 'minimal'.

Wildlife:

In general, the site provides poor quality habitat for wildlife. The site is surrounded by urban development and has been previously disturbed and thus does not provide ideal habitat for wildlife species. Impact of development on potential wildlife habitat will be negligible and there are no known protected species on the site. The site is not suitable habitat for any Federally-listed threatened and endangered species.

Wildfire:

The primary wildland fuel type is grassland. The Colorado State Forest Service has determined a moderate-high wildfire hazard potential and listed a moderate risk, as this area is currently undisturbed grassland. Development of the site will reduce available wildfire fuels in this area.

LANDSCAPE, BUFFERING & SCREENING

Perimeter Landscape and Buffering:

Landscaping at the perimeter of the property is required based on proximity to right of way and existing single-family detached residential development, and will be provided below:

Street Name	Street Classification	Landscape Width	Number of Trees
Meridian Road	Expressway/Principal Arterial	25'	1 per 20 feet
Owl Place	Non-Arterial	10'	1 per 30 feet
Meridian Park Drive	Non-Arterial	10'	1 per 30 feet

A 15' wide buffer, comprised of one tree per 25' (of which a minimum of 1/3 shall be evergreen trees), is required and is provided between the adjacent residential lot to the west.

Parking Lot Landscaping:

Parking lots are required to be screened to a minimum height of 3' from view of adjacent roads and properties with differing land use. Two-thirds of the lot line with parking that abuts the street/differing land use must be screened. This screening is accomplished with trees and shrubs.

Internal Landscaping:

A minimum of 5% of the lot area is required to be landscaped, and include one tree per 500 square feet of required landscape area. With a development area of 418,612 sq ft, 20,931 sq ft must be landscaped, and must include 42 trees. A total of 142,969 sq ft of internal landscaped area is provided, comprised of 29 trees and shrubs.

Screening:

Screening of differing uses and public streets at a height of 3' is also required, and is accomplished with trees, shrubs and walls.

PCD#: TBD Meridian Storage Site Development Plan 9/8/23

Conclusion

The Site Development Plan is harmonious and consistent with the surrounding land uses. The Proposed Development complies with the requirements of the zone district in which it is located, is consistent with the intent and purpose of the Zoning Code and is compatible with the land uses surrounding the site.

Please contact me at 719-900-7220 with any questions or comments.

Sincerely, GALLOWAY Brynhildr Halsten, PLA

Engineer's Statement

The attached drainage plan and report were prepared under my direction and supervision and are correct to the best of my knowledge and belief. Said drainage report has been prepared according to the criteria established by the County for drainage reports and said report is in conformity with the applicable master plan of the drainage basin. I accept responsibility for any liability caused by any negligent acts, errors or omissions on my part in preparing this report.

Brady Shyrock, PE # 38164 For and on behalf of Galloway & Company, Inc.

Developer's Certification

I, the developer, have read and will comply with all of the requirements specified in this drainage report and plan.

I. Introduction

This document is the Final Drainage Report for Falcon Ranchettes Filing No. 2 (Meridian Storage). The project consists of two lots and public right-of-way that make up 9.604 acres. This project proposes storage units, an office building, roadway and utility infrastructure, a water quality treatment pond, and drainage channel improvements to the existing east branch of Unnamed Tributary to Black Squirrel Creek (UTBSC East Branch).

Purpose

The purpose of this report is to identify on and offsite drainage patterns and confirm that the new development has no significant changes to existing drainage patterns.

Previous Drainage Studies

- Falcon Drainage Basin Planning Study, dated September 2015 Referred to as **Falcon DBPS** hereon.
- Bent Grass MDDP Amendment & DBPS Amendment, dated September 2021 Referred to as Bent Grass MDDP hereon.
- Request for Conditional Letter of Map Revision, Unnamed Tributary to Black Squirrel Creek, Falcon Owl Place, dated October 25, 2022 – Referred to as Falcon Owl Place CLOMR hereon.
- Request for Letter of Map Revision, Unnamed Tributary to Black Squirrel Creek, Falcon Marketplace, dated March 15, 2021 – Referred to as Falcon Marketplace LOMR hereon.
- Final Drainage Report for Falcon Marketplace, dated November 4, 2019 Referred to as **Falcon Marketplace FDR** hereon.

Relevant excerpts from existing drainage reports are provided in **Appendix B** for reference.

Location

Falcon Ranchettes Filing No. 2 is located in the Southeast Quarter of Section 1, Township 13 South, Range 65 West of the 6th Principal Meridian, County of El Paso, State of Colorado.

The project site is located at the northwest corner of Owl Place and Meridian Road, bounded to the North by Lot 2A Bent Grass East Commercial Fil No 2a and Tract A Bent Grass East Commercial Fil No 2, to the south by Lots 14 & 15 of Falcon Ranchettes, to the East by Meridian Road right-of-way, to the West by Lot 3 of Falcon Ranchettes. A Vicinity Map is provided in **Appendix A**.

Description of Property

The existing parcel is currently developed with two residential properties (*Lot 1 & 2 of Falcon Ranchettes*). Two single-family homes occupy the site, but the majority of the existing parcels are covered by native prairie grass land. An existing drainage-way flows north to south along the eastern property line adjacent to Meridian Road right-of-way, named "Unnamed Tributary to Black Squirrel Creek - East Branch".

Soils

According to the U.S. Department of Agriculture Natural Resources Conservation Service Soil Survey of El Paso County, Colorado (See **Appendix A**) the primary soil found is Columbine gravelly sandy loam, classified as Soil Conservation Service (SCS) hydrologic soil group "A".

Climate

This area of El Paso County is located at the foothills of the Southern Rocky Mountains. Classified as an alpine desert, Falcon, CO averages 300 days of sunshine with low humidity. Annual precipitation ranges between 10-16 inches, occurring mostly in spring and summer months.

Geotechnical Recommendations

Positive drainage away from the structures should be provided during construction and maintained throughout the life of the structures. Any downspouts, roof drains or scuppers should discharge into splash blocks or extensions and away from the structures. Backfill against footings, exterior walls and in utility trenches should be properly compacted and free of all construction debris to reduce the possibility of moisture infiltration. Refer to the Geotechnical Exploration Report prepared by Universal Engineering Sciences for more detailed information.

Flood Insurance Rate Map

According to the Federal Emergency Management Agency (FEMA) Flood Insurance Rate Map (FIRM) #08041C0553G, effective date December 7, 2018. The project site is located in Zone X (Areas determined to be outside of the 0.2% annual chance floodplain). A copy of the FIRM map is provided in **Appendix A** for reference.

Major Drainage Basin

Falcon Ranchettes Filing No. 2 is located within the MT060 drainage basin as described in the **Falcon DBPS**. The Falcon Watershed is located in the north central portion of El Paso County and flows southeasterly from the southern slope of the Black Forest. The Falcon watershed contains three perennial streams and has a contributing drainage area of approximately 10.6 square miles at its confluence with Black Squirrel Creek.

Detailed recommendations from the **Falcon DBPS** are included below under "*IV. Proposed Drainage Patterns and Features*".

II. Drainage Design Criteria

Development Criteria Reference

The analysis and design of the drainage concept and stormwater management system for this project was prepared in accordance with the criteria set forth in the Mile High Flood District (MHFD) Urban Storm Drainage Criteria Manual (USDCM) dated January 2016 and the adopted chapters 6 & 13 from the City of Colorado Springs Drainage Criteria Manual (DCM) Vol. 1, last revised January 2021

Hydrologic Criteria

The rational method was used to calculate peak flows as the tributary areas are less than 100 acres. An analysis of the hydrology using the rational method can be found in **Appendix C** - Hydrologic Calculations. The rational method has proved to be accurate for basins of this size and is based on the following formula:

Q = CIA

Where:

Q = Peak Discharge (cfs)
C = Runoff Coefficient
I = Runoff intensity (inches/hour)
A = Drainage area (acres)

The rainfall intensity calculations are based on the DCM Figure 6-5 and IDF equations. The one hour point rainfall data for the design are listed in Table 1 below.

Return Period	Return Period One Hour Depth (in).						
5-year	1.50	5.17					
100-year	2.52	8.68					

Table 1 - Precipitation Data	a (Table 6.2 in DCM Vol. 1)
------------------------------	-----------------------------

Time of concentrations have been adapted from equation 6-7 of The City of Colorado Springs Drainage Criteria Manual, Volume 1 which are as follows:

 $Tc=T_i + T_t$

Where:

 $\begin{array}{l} T_c = \text{time of concentration (min)} \\ T_i = \text{overland (initial) flow time (min)} \\ T_t = \text{travel time in the ditch, channel, gutter, storm sewer, etc. (min)} \end{array}$

Overland (Initial) Flow Time: from equations 6-8 from the City of Colorado Springs Drainage Criteria Manual, Volume 1.

$$t_t = \frac{0.395(1.1 - C_5)\sqrt{L}}{S^{0.33}}$$

Where:

 $\begin{array}{l} T_i = \mbox{overland (initial) flow (min)} \\ C_5 = \mbox{runoff coefficient for 5-year frequency} \\ L = \mbox{length of overland flow (ft) (300 ft maximum for non-urban land uses, 100 ft maximum for urban land uses)} \\ S = \mbox{average basin slope (ft/ft)} \end{array}$

Travel Time

$$V = C_v^* S_w 0.5$$

Where:

 $\begin{array}{l} V = Velocity \; (ft/s) \\ C_v = conveyance \; coefficient \\ S_w = watercourse \; slope \; (ft/ft) \end{array}$

The runoff coefficients are calculated based on land use, percent imperviousness, and design storm for each basin, as shown in the DCM, (Table 6-6).

Hydraulic Criteria

Storm Pipe

Hydraulic design and analysis for this report were performed through the usage of StormCAD. A tabular summary from analysis performed by StormCAD can be found in **Appendix D** - Hydraulic Calculations. Additionally, the table below shows the parameters used for StormCAD Standard Method Coefficients taken from *DCM Vol 1 Chapter 9 Table 9-4*.

BEND LOSS		
BEND ANGLE	K COEFFICIENT	
0°	0.05	
22.5°	0.10	
45°	0.40	
60°	0.64	
90°	1.32	
LATERAL LOSS		
ONE LATERAL K COEF	FICIENT	
BEND ANGLE	NON -SURCHARGED	SURCHARGES
45°	0.27	0.47
60°	0.52	0.90
90°	1.02	1.77
TWO LATERAL K COEI	FICIENT	
45°	0.96	
60°	1.16	
90°	1.52	

Storm Inlets

CDOT-Type R Storm Curb Inlets were sized using the UD-Inlet_v5.02 spreadsheet from Mile High Flood District. Additionally, CDOT Type 13 area inlets were sized using a depth to capacity line graph. These calculations are provided in **Appendix D**.

Detention Pond

As shown in Part IV: Onsite PWQ Requirements, Documentation and Considerations of the PBMP Applicability Form, this project is required to provide treatment for the Water Quality Capture Volume (WQCV) Standard.

Proposed *Pond #1* was designed using the Mile High Flood District (MHFD) software spreadsheets; It is the recommended design software because it provides tabulated results of the WQCV, EURV, 2-, 5-, 10-,

25-, 50-, 100- and 500-year storm events routed through the pond. The detention criteria provided by the MHFD's design spreadsheets *MHFD-Detention_v4.06* was used to determine the adequate storage capacity of the detention pond, and the associated elements of the outlet structure. The UDFCD Manual provides approximate, empirical equations that are utilized in the spreadsheet provided by MHFD. These equations and methods are further described in the USDCM Vol. 2, Ch. 12. The required volume calculations as well as the outlet structure design calculations are provided in **Appendix E** – Pond Calculations of this report.

Detailed water surface elevations and pond design information are included below under "*IV. Proposed Drainage Patterns and Features*".

Drainage Channel

Proposed improvements to UTBSC East Branch was analyzed using Bentley software *FlowMaster* to properly size a trapezoidal channel to safely convey stormwater while providing 1.0-ft minimum of freeboard. Additionally, the 3 proposed grouted stepped boulder drop structures were designed using criteria set forth in USDCM from Mile High Flood District. FlowMaster calculations can be found in **Appendix D**.

Detailed steps of the Simplified Design Procedure as shown in the USDCM are included below under "*IV. Proposed Drainage Patterns and Features*".

Four Step Process

The Four Step Process is used to minimize the adverse impacts of urbanization and is a vital component of developing a balanced, sustainable project. Below identifies the approach to the four-step process:

1. Employ Runoff Reduction Practices

This step uses low impact development (LID) practices to reduce runoff at the source. Generally, rather than creating point discharges that are directly connected to impervious areas runoff is routed through pervious areas to promote infiltration. The Impervious Reduction Factor (IRF) method was used and calculations can be found in Appendix E.

2. Implement BMP's That Provide a Water Quality Capture Volume with Slow Release

This step utilizes formalized water quality capture volume to slow the release of runoff from the site, while the WQCV will release in no less than 40 hours. Proposed Pond #1 will provide water quality treatment for all developed areas prior to the runoff being released into existing sub-regional detention pond SR-4.

3. Stabilize Drainageways

This step implements stabilization to channels to accommodate developed flows while protecting infrastructure and controlling sediment loading from erosion in the drainageways. Drainage channel improvements are proposed to the existing UTBSC East Branch (RMT064), including widening the existing channel with 3 proposed grouted stepped boulder drop structures.

4. Implement Site Specific and Other Source Control BMPs

The biggest source control BMP is public education which can be found on the City of Colorado Springs website and discuss topics such as: pet waste, car washing, private maintenance

landscaping, fall leaves, and snow melt and deicer. A no vehicle maintenance policy will be enforced to avoid the potential contaminations caused from vehicle fluid replacement, and equipment replacement and repair. In addition, the landscaping and snow removal is handled completely by the property management to ensure proper lawn mowing and grass clipping disposal, lawn aeration, and fertilizer application is being followed. Snow removal will also be handled by the property manager to ensure proper consideration of snow pile placement and use of deicing chemicals.

III. Existing Drainage Patterns and Features

Existing Drainage Patterns

On-Site:

The existing drainage pattern sheet flows from north to south. Flows from basin **EX-1** sheet flow into the existing roadside ditch (RMT064) and then conveyed to **DP1** where existing 36" twin CMP culverts pipe flows under Owl Place. The culverts are severely undersized and partially filled with sediment, a detailed analysis of these culverts is provided in the **Owl Place CLOMR**. Basins **EX-2** and **EX-3** flow south and pool along the north edge Owl Place near **DP2** and **DP3**. Flows eventually overtop the gravel road and continue south.

Off-Site:

Basins **EX-4** and **OS-1** flow south and pool at **DP4**. These flows eventually overtop the gravel road and continue south.

Sub-Basin Descriptions

Note: an existing drainage map is provided in **Appendix F** and should be referenced when reading the basin descriptions below.

Basin EX-1 (4.97 acres, Q5 = 1.6 cfs, Q100 = 7.7 cfs): a basin that encompasses the northeast portion of the project site. Runoff sheet flows from north to south and eventually spills into the existing Meridian Road roadside ditch, RMT064. Flows continue south to **DP1** where existing 36" twin CMP culverts pipe flows under Owl Place.

Basin EX-2 (2.32 acres, Q5 = 0.6 cfs, Q100 = 3.2 cfs): a basin that encompasses a portion of the center of the site. Flows drain from north to south to **DP2** where flows pool along the north edge of Owl Place until eventually overtopping the gravel road and continuing south.

Basin EX-3 (2.85 acres, Q5 = 0.3 cfs, Q100 = 3.0 cfs): a basin that encompasses the west portion of the site. Flows drain from north to south to **DP3** where flows pool along the north edge of Owl Place until eventually overtopping the gravel road and continuing south.

Basin EX-4 (1.08 acres, Q5 = 0.0 cfs, Q100 = 0.9 cfs): a basin that encompasses the far west portion of the site. Flows drain from north to south to **DP4** where flows pool along the north edge of Owl Place until eventually overtopping the gravel road and continuing south.

Basin OS-1 (3.29 acres, Q5 = 0.6 cfs, Q100 = 4.0 cfs): a basin that is associated with Lot 3 Falcon Ranchettes, a parcel immediately west of the project site. Flows drain from north to south to **DP4** where flows pool along the north edge of Owl Place until eventually overtopping the gravel road and continuing south.

IV. Proposed Drainage Patterns and Features

Proposed Drainage Plan

On-Site:

The project site consists of 1 office building and 9 self-storage. Access is provided to Meridian Park Drive near the center of the site, with an emergency access drive to the north for emergency services only. Concrete valley gutters are used for all internal drive aisles to route runoff to proposed storm drain infrastructure and then piped to Pond #1 to provide detention and treatment for the WQCV. The pond outfall conveys flows south directly to an existing sub-regional pond (SR-4).

The proposed public roadway improvements convey runoff using curb and gutter and routing flows to proposed storm drain infrastructure and then piped to Pond #1 to provide detention and treatment for the WQCV. The pond outfall conveys flows south directly to an existing sub-regional pond (SR-4).

Drainage channel improvements to the existing RMT064 is discussed below under "*IV. Proposed Drainage Patterns and Features*", including the existing culvert crossing at Owl Place.

Off-Site:

The existing drainage pattern of OS-1 remains unchanged. However, to avoid the stormwater pooling and overtopping at Owl Place, a small Nyloplast Drain Basin (Public) is proposed to capture flows and route the runoff safely to Pond SR-4.

Sub-Basin Descriptions discuss inlet bypass flow path, as applicable

Note: a proposed drainage map is provided in **Appendix F** and should be referenced when reading the basin descriptions below.

Basin A-1 (1.85 AC, $Q_5 = 2.1$ cfs, $Q_{100} = 5.9$ cfs): Located on the far east side of the site, this basin consists of the proposed drainage channel and a portion of Meridian Road. Runoff from this basin will sheet flow into the drainage channel and then be conveyed south to **DP1** where existing 36" twin culverts will pipe flows under Owl Place. discuss why the flows changed and the ultimate outfall beyond owl place culverts.

Basin B-1 (1.54 AC, $Q_5 = 6.5$ cfs, $Q_{100} = 11.5$ cfs): Located at the northeast of the site, this basin consists of the north half of the storage unit buildings. Runoff from this basin will sheet flow south entering a proposed concrete valley gutter. Flows are then conveyed south toward the center of the site, to a proposed CDOT Type 13 Area Inlet-Triple (Private), **DP2**.

Basin B-2 (1.26 AC, $Q_5 = 5.3$ cfs, $Q_{100} = 9.4$ cfs): Located on the southeast portion of the site, this basin consists of the south half of the self-storage buildings. Runoff from this basin will sheet flow south entering a proposed concrete valley gutter. Flows are then conveyed south toward the south end of the site, to a proposed CDOT Type 13 Area Inlet-Triple (Private), **DP3**. discuss where flows go after DP and any WQ treatment.

Basin B-3 (1.05 AC, $Q_5 = 4.7$ cfs, $Q_{100} = 8.1$ cfs): Located in the center of the site, this basin consists of the west half portion of Meridian Park Drive and the portion of the existing Owl Place centerline, west of the Meridian Park Drive and Owl Place intersection. Runoff from this basin will sheet flow from all directions onto proposed Type A curb and gutter. Flows will then be routed via curb & gutter, to a proposed 5' CDOT Type 'R' storm sump inlet (private), DP4. discuss where flows go after DP and any WQ treatment.

figure calls out this inlet as public, please clarify **Basin B-4** (1.05 AC, Q₅ = 1.8 cfs, Q₁₀₀ = 4.2 cfs): Located in the center of the site, this basin consists of the east half portion of Meridian Park Drive and the portion of the proposed Owl Place corridor, east of the Meridian Park Drive and Owl Place intersection. Runoff from this basin will sheet flow from all directions onto proposed Type A curb and gutter. Flows will then be routed via curb & gutter, to a proposed 10' CDOT Type 'R' storm sump inlet (private), **DP5**. discuss where flows go after DP and any WQ treatment.

Basin B-5 (0.38 AC, $Q_5 = 1.5$ cfs, $Q_{100} = 2.7$ cfs): Located on the southeast portion of the site, this basin consists of the entire proposed detention pond. Runoff from this basin will sheet flow into Detention Pond #1. Flows will then be routed east to a proposed 35' X 68' CDOT Type 'D' storm inlet (public), DP6.

confirm dimensions

Basin C-1 (0.78 AC, $Q_5 = 0.0$ cfs, $Q_{100} = 0.6$ cfs): Located on the north center portion of the site, this basin is directly east of Meridian Park Drive. Runoff from this basin will sheet west onto proposed Type A curb and gutter. Flows will then be routed via curb & gutter, to a proposed 10' CDOT Type 'R' storm sump inlet (private), **DP5**. discuss where flows go after

DP and any WQ treatment.

Basin C-2 (2.02 AC, $Q_5 = 0.0$ cfs, $Q_{100} = 0.6$ cfs): Located on the east portion of the site, east of Meridian Park Drive. Runoff from this basin will sheet flow into Detention Pond #1. Then, flows are conveyed east to a proposed 35' X 68' CDOT Type 'D' storm inlet (public), DP6.

Basin C-3 (0.20 AC, $Q_5 = 0.0$ cfs, $Q_{100} = 0.2$ cfs): Located on a small southwest portion of the site, east of Detention Pond #1. Runoff from this basin will sheet flow south into a proposed Type A curb and gutter and west into Detention Pond #1. Then, flow into proposed Type A curb and gutter are conveyed to a proposed 10' CDOT Type 'R' storm sump inlet (private), DP5 and flows into Detention Pond #1 are conveyed to a proposed 35' X 68' CDOT Type 'D' storm inlet (public), DP6.

Basin C-4 (1.06 AC, $Q_5 = 0.0$ cfs, $Q_{100} = 0.8$ cfs): Located on the east portion of the site, along the property boundary line. This basin consists of an existing drainage channel flowing north to south. Runoff from this basin will sheet flow to an existing drainage channel, then flow into a proposed 2' X 2' CDOT Nyloplast drain basin, **DP7**. discuss where flows go after DP and any WQ treatment exclusions (i.e., I.7.1.B.7 - land disturbance to undeveloped land that will remain undeveloped)

Basin F-1 (0.04 AC, $Q_5 = 0.2$ cfs, $Q_{100} = 0.3$ cfs): An off-site basin, located on a small portion of the west side of the centerline for the future development for Meridian Park Drive. Runoff from this basin will sheet flow south offsite to the adjacent parcel.

Basin F-2 (0.03 AC, $Q_5 = 0.1$ cfs, $Q_{100} = 0.2$ cfs): An off-site basin, located on a small portion of the east side of the centerline for the future development for Meridian Park Drive. Runoff from this basin will sheet flow south offsite to the adjacent parcel.

Basin OS-1(3.29 AC, $Q_5 = 0.0$ cfs, $Q_{100} = 0.1$ cfs): An off-site basin, located along the east portion of the site property boundary line. This basin consists of an existing drainage channel flowing north to south.

Runoff from this basin will sheet flow to an existing drainage channel, then flow into a proposed 2' X 2' CDOT Nyloplast drain basin, **DP7**.

Basin OS-2 (0.09 AC, $Q_5 = 0.0$ cfs, $Q_{100} = 0.1$ cfs): An off-site basin, located along the northeast portionof the site property boundary line. This basin consists of a 4:1 downslope from the berm of existingdetention pond from Tract A of Bent Grass East Commercial Filing No. 2. Runoff from this basin will sheetflow from north to south onto proposed site.discuss where flows go and
any WQ treatment.

Basin OS-3 (0.01 AC, $Q_5 = 0.0$ cfs, $Q_{100} = 0.1$ cfs): An off-site basin, located along the northeast portion of the site property boundary line. This basin consists of a 4:1 downslope from the berm of existing detention pond from Tract A of Bent Grass East Commercial Filing No. 2. Runoff from this basin will sheet flow from north to south onto proposed site. discuss where flows go and any WQ treatment.

Basin OS-4 (0.07 AC, $Q_5 = 0.0$ cfs, $Q_{100} = 0.1$ cfs): An off-site basin, located along the northwest portion of the site property boundary line. Runoff from this basin will sheet flow from north to south onto proposed

site. discuss where flows go and

any WQ treatment.

Proposed Detention/Water Quality Pond

Pond #1 consists of a forebay, trickle channel, micropool, outlet structure (with trash rack, orifice plate, and overflow weir), and emergency spillway. The WQCV will be treated using an orifice plate, all other storm events are designed to spill into the overflow weir and into the outfall pipe and routed to sub-regional pond SR-4. The required WQCV is 0.307 ac-ft. The provided storage for the WQCV is 0.308 ac-ft.

Generally, the 500-year storm event is conveyed through the emergency spillway. However, because all adjacent roadways eventually drain back into Pond #1, the outlet structure is designed to handle the full 500-year storm event and safely convey flows to the existing sub-regional pond SR-4 by storm pipe.

All C-Group drainage basins are included in determining the tributary drainage area and imperviousness for Pond #1. It is anticipated that all C-Group basins will soon develop into additional storage units or similar commercial use. Were OS-2, OS-3, and OS-4 also included in design calcs?

Refer to **Appendix E** for Pond #1 calculations.

Drainage Channel Improvements – UTBSC East Branch (RMT064)

Falcon DBPS Analysis:

El Paso County completed hydrologic and hydraulic analyses summarized in the **Falcon DBPS**. The **Falcon DBPS** watershed encompasses three major basins, including the "Middle Tributary" which includes the subject property. The unnamed tributary to Black Squirrel Creek (UTBSC) in the Middle Tributary consists of an "East Branch" and "West Branch" that converges at the Falcon Marketplace site. The UTBSC East Branch is located along the eastern edge of the project site adjacent to Meridian Road, the West Branch does not cross the subject property.

The Falcon DBPS provides junctions north and south of the project site, named JMT050 and JMT060. These junctions are summarized below, also see **Appendix B** for Falcon DBPS excerpts showing the physical location of each junction.

	Future Peak Discharges from Falcon DBPS						
Falcon DBPS Model Location	Physical Location	Branch	Proximity to Project Site	Future Flow Q100 (cfs)			
JMT050	Bent Grass Meadows Drive & Meridian Road	East Branch	Upstream from Project Site	850			
JMT060	Eastonville Road & Meridian Road	East and West Convergence	Downstream from Project Site	1,000			

The **Falcon DBPS** specifies reach improvements between junctions JMT050 and JMT060, the reach between these two junctions is named "RMT064". This is visually shown in the **Falcon DBPS**, *Figure 6-1*. *Selected Plan*, located in **Appendix B**. These improvements include small drop structures w/ toe protection.

Bent Grass MDDP Analysis:

A drainage diversion took place as part of the Bent Grass Residential Filing No. 1 development. The UTBSC West Branch was rerouted to the East towards the intersection of Meridian Road and Bent Grass Meadows Drive. This diversion is discussed <u>extensively</u> in the **Bent Grass MDDP**.

Because of the diversion, a new junction was created in the Middle Tributary named JMT060a. This junction is primarily known as "Design Point 20" in the text and drainage maps in **Bent Grass MDDP**. This new junction is located just south of JMT050 from the **Falcon DBPS** and summarized in the table below.

Future Peak Discharges from Bent Grass MDDP							
Bent Grass MDDP Model Location	Physical Location	Branch	Proximity to Project Site	Future Flow Q100 (cfs)			
JMT060a	Bent Grass Meadows Drive & Meridian Road	East Branch	Upstream from Project Site	909.3			

The **Bent Grass MDDP** specifies a 15' wide bottom channel with 4:1 side slopes, 6.5' deep and a longitudinal slope of 0.30% for RMT064 of the UTBSC East Branch. An excerpt of these calculations is provided in **Appendix B**.

Owl Place CLOMR Analysis:

The Falcon Owl Place development (located south of the project site across Owl Place) includes regrading and rerouting a portion of the UTBSC East Branch. The improvements intercept the existing creek immediately north of Owl Place and conveys it via a 10'x6' box culvert to the subregional detention pond (SR4). The box culvert is designed to convey the full 100-year discharge.

The **Falcon DBPS** did not include a junction on the East Branch immediately upstream of the convergence (Pond SR4). Therefore, the **Owl Place CLOMR** modified the HMS model to create a new junction located at the southern boundary of the Falcon Owl Place development, immediately upstream of Pond SR4. This junction is summarized in the table below.

Peak Discharges from Owl Place CLOMR						
Owl Place CLOMR Model Location	Physical Location	Branch	Proximity to Project Site	Future Flow Q100 (cfs)		
JMT051	Immediately Upstream of Pond SR4	East Branch	Downstream from Project Site	920		

Previous Reports Conclusions:

Per **Falcon DBPS**, channel improvements are required to stabilize the adjacent RMT064 of UTBSC East Branch. A design flow of 925 cfs was used as the design flow for these improvements, as specified in the **Bent Grass MDDP**. The table below compares the proposed design flow against previous reports.

	Proposed Design Flow Comparison							
Model Location	Physical Location	Branch	Proximity to Project Site	Future Flow Q100 (cfs)				
RMT064	North of Owl Place, South of Bent Grass Meadows Drive	East Branch	-	925				
JMT050 (Falcon DBPS)	Bent Grass Meadows Drive & Meridian Road	East Branch	Upstream from Project Site	850				
JMT060a (Bent Grass MDDP)	Bent Grass Meadows Drive & Meridian Road	East Branch	Upstream from Project Site	909.3				
JMT051 (Owl Place CLOMR)	Immediately Upstream of Pond SR4	East Branch	Downstream from Project Site	920				

Because of added junctions (JMT060a & JMT051) from **Bent Grass MDDP** and **Owl Place CLOMR**, no revisions to existing HMS models are needed for identifying the proposed design flow for RMT064. As shown above, the design flow of 925 cfs exceeds all projected HMS models for junctions north and south of RMT064.

Due to the design slope of 0.30%, 3 drop structures are required. The USDCM provides guidance for a "Simplified Design Procedure" for drop structure design that requires no hydraulic analysis. This method was used to design the grade control structures for RMT064.

Urban Storm Drainage Criteria Manual (USDCM) Design Guidance:

The USDCM Vol. 2, Chapter 9, Section 2 includes guidance and design procedures for Grade Control Structures.

The simplified design procedure can be used for grade control structures meeting design criteria provided in the table below and where all of the following criteria are met:

- Maximum unit discharge for the design event (typically the 100-year) over any portion of the drop structure is 35 cfs/ft or less,
- Net drop height (upstream channel invert less downstream channel invert exclusive of stilling basin depth) is 5 feet or less,
- Drop structure is constructed of GSB or SC,
- Drop structure is located within a tangent section and at least twice the distance of the width of the drop at the crest both upstream and downstream from a point of curvature,
- Drop structure is located in a reach that has been evaluated per the design requirements of the Open Channel chapter.

The table below summarizes the specific design and geometric parameters used for RMT064.

Note: Channel construction drawings were prepared for the RMT064 improvements and should be referenced when reading this table.

Design Parameter	Requirement to Use Simplified Design Procedure (As shown in USDCM)	Proposed Design	Meets or Exceeds Criteria?
Maximum Net Drop Height (Hd)	5 feet	3 feet	Yes
Maximum Unit Discharge over any Portion of Drop Width	35 cfs per foot of drop width	25.9 cfs*	Yes
Maximum Longitudinal Slope (Steepest Face Slope)	4(H):1(V)	4:1	Yes
Minimum Stilling Basin Depression (Db)	1 foot	N/A**	Yes
Minimum Length of Approach Riprap	8 feet	10 feet	Yes
Minimum Stilling Basin Length (Lb)	Determine using Figure 9-1	N/A**	Yes
Minimum Stilling Basin Width (B)	Same as crest width	N/A**	Yes
Minimum Cutoff Wall Depth	6 feet	6 feet	Yes

Minimum Length of			
Riprap Downstream	10 feet	N/A**	Yes
of Stilling Basin			
Minimum D50 for		10 10 10 10	
Approach and	12 inches	12 inches	Yes
Downstream Riprap		(Type M Riprap)	
Minimum Boulder			
Size for Drop	Per Figure 9-1	24" Boulder Size	Yes
Structure			

*Results from FlowMaster were used to calculate the approximate unit discharge per foot of drop width

**Due to the sandy soils on site and within the channel, future degradation is expected. Therefore, the stilling basins were removed and replaced with a sloping face extending five feet below the downstream toe invert of each drop structure.

Existing 36" Twin Culverts

Discuss what will happen if the proposed culvert replacements are not installed by the time the Meridian Storage project is finalized.

The two 36" CMP culverts located at the southeast end of the project site, crossing Owl Place are severely undersized and partially filled with sediment. As stated in the **Owl Place CLOMR**, the culverts only convey 86-95 cfs, depending on tailwater depth. The remaining flow (approximately 825-834 cfs) in the 100-year event overtops Owl Place.

The Falcon Owl Place development (located south of the project site across Owl Place) includes regrading and rerouting a portion of the UTBSC East Branch. The improvements intercept the existing creek immediately north of Owl Place and conveys it via a 10'x6' box culvert to the subregional detention pond (SR4). The proposed box culvert begins just north of Owl Place and will replace the undersized culverts. The exact construction schedule is unknown at this time but expected to run concurrently with the Meridian Storage project.

Construction plans for the culvert replacement and associated improvements are located in Appendix B.

 $\mathbf{\mathbf{Y}}$

V. Ownership & Maintenance

After completion of construction and upon the Board of County Commissioners acceptance, it is anticipated all public drainage facilities are to be owned and maintained by El Paso County. All private drainage facilities are to be owned and maintained my Meridian Storage, LLC. The table below provides a summary of each facilities' ownership & maintenance responsibilities.

Drainage Facility	Ownership and Maintenance Entity
Drainage Channel (UTBSC East Branch) – RMT064	El Paso County
Pond #1	El Paso County
Public Storm Drain Infrastructure (See Construction	
Drawings, and "VI. Fee Development" below for	El Paso County
breakdown)	

Update per VR239 comments

Private Storm Drain Infrastructure (See Construction Drawings, and "*VI. Fee Development*" below for breakdown)

VII. Conclusion

This Final Drainage Report for Falcon Ranchettes Filing No. 2 was prepared using the criteria and methods as described in the Mile High Flood District (MHFD) Urban Storm Drainage Criteria Manual (USDCM) and the adopted chapters 6 & 13 from the City of Colorado Springs Drainage Criteria Manual (DCM) Vol. 1. The downstream facilities are adequate to protect the runoff proposed from the site. The site runoff will not adversely affect the downstream and surrounding developments. This report is in general conformance with all previously prepared reports that included this site.

Totals for Area of Intere	est		17.4	100.0%

Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

FALCON DRAINAGE BASIN PLANNING STUDY SELECTED PLAN REPORT **FINAL - SEPTEMBER 2015**

Prepared for:

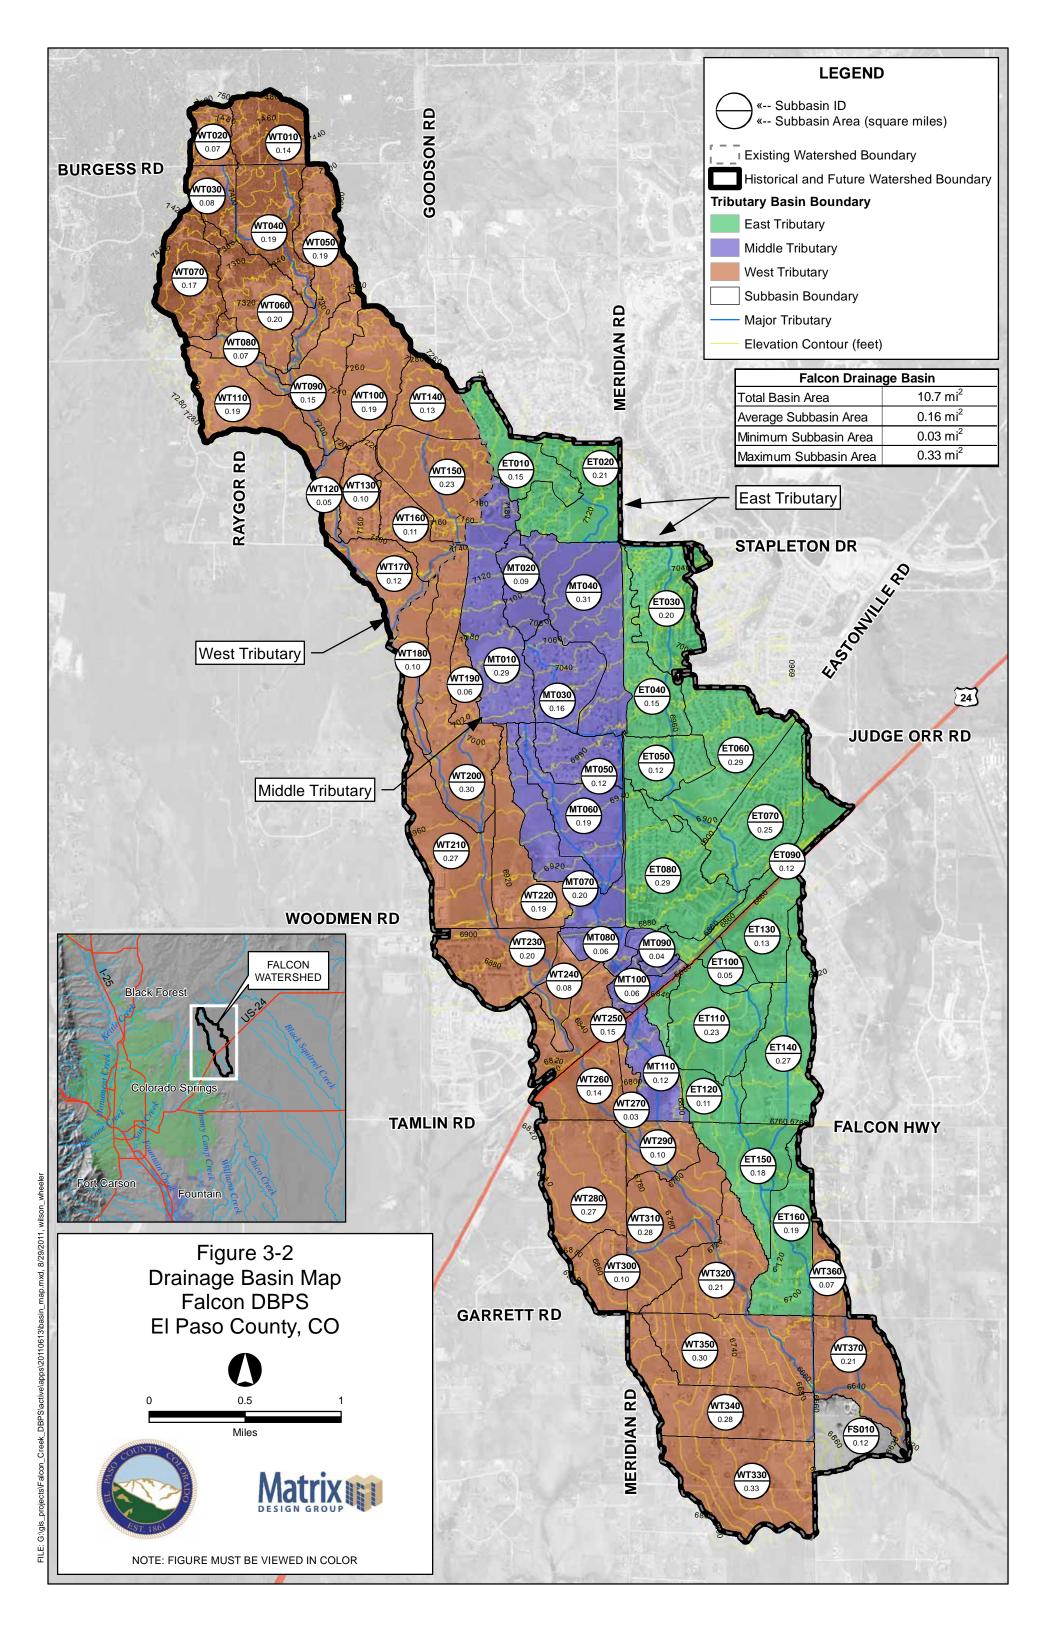

El Paso County Public Services Department 3275 Akers Drive Colorado Springs, CO 80922

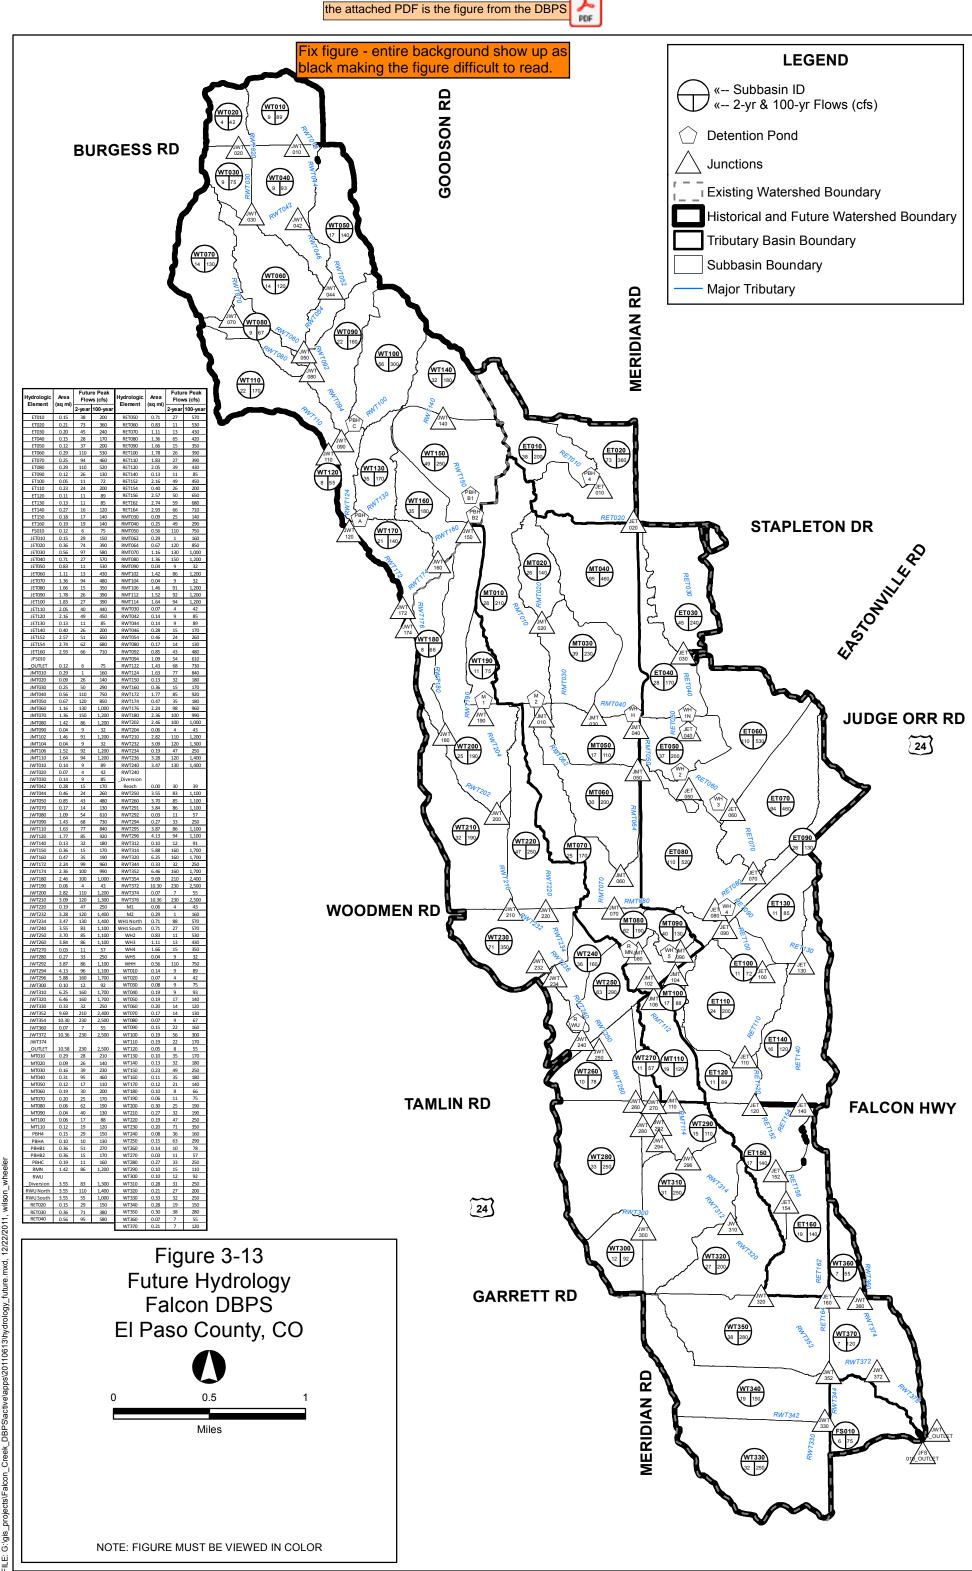

Prepared By:

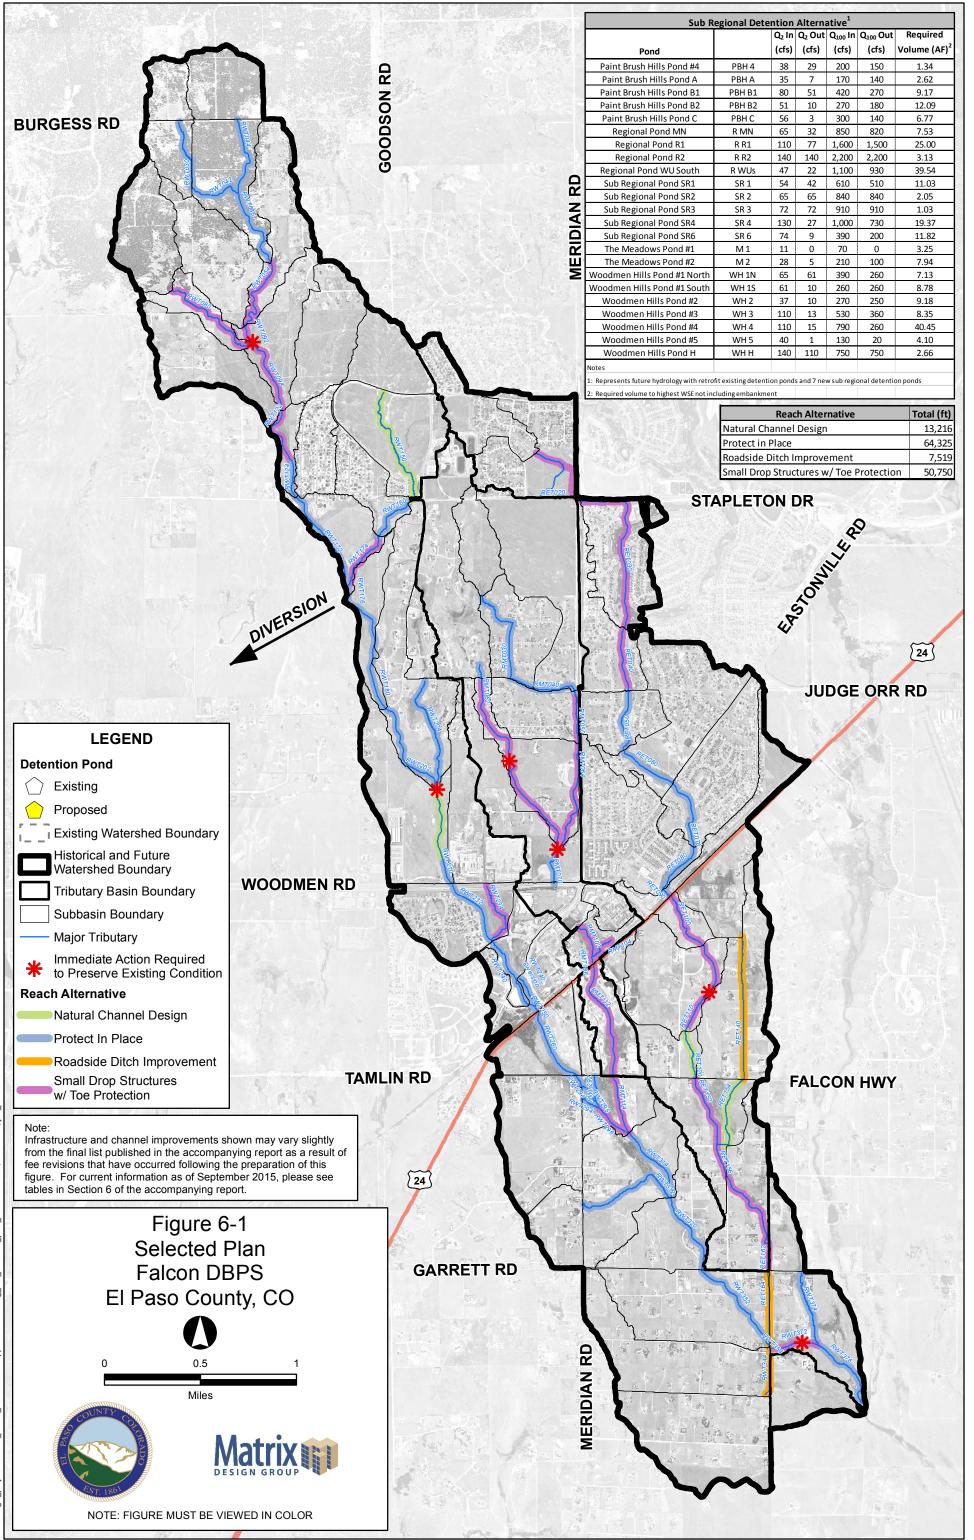

Matrix Design Group 2435 Research Parkway, Suite 300 Colorado Springs, CO 80920

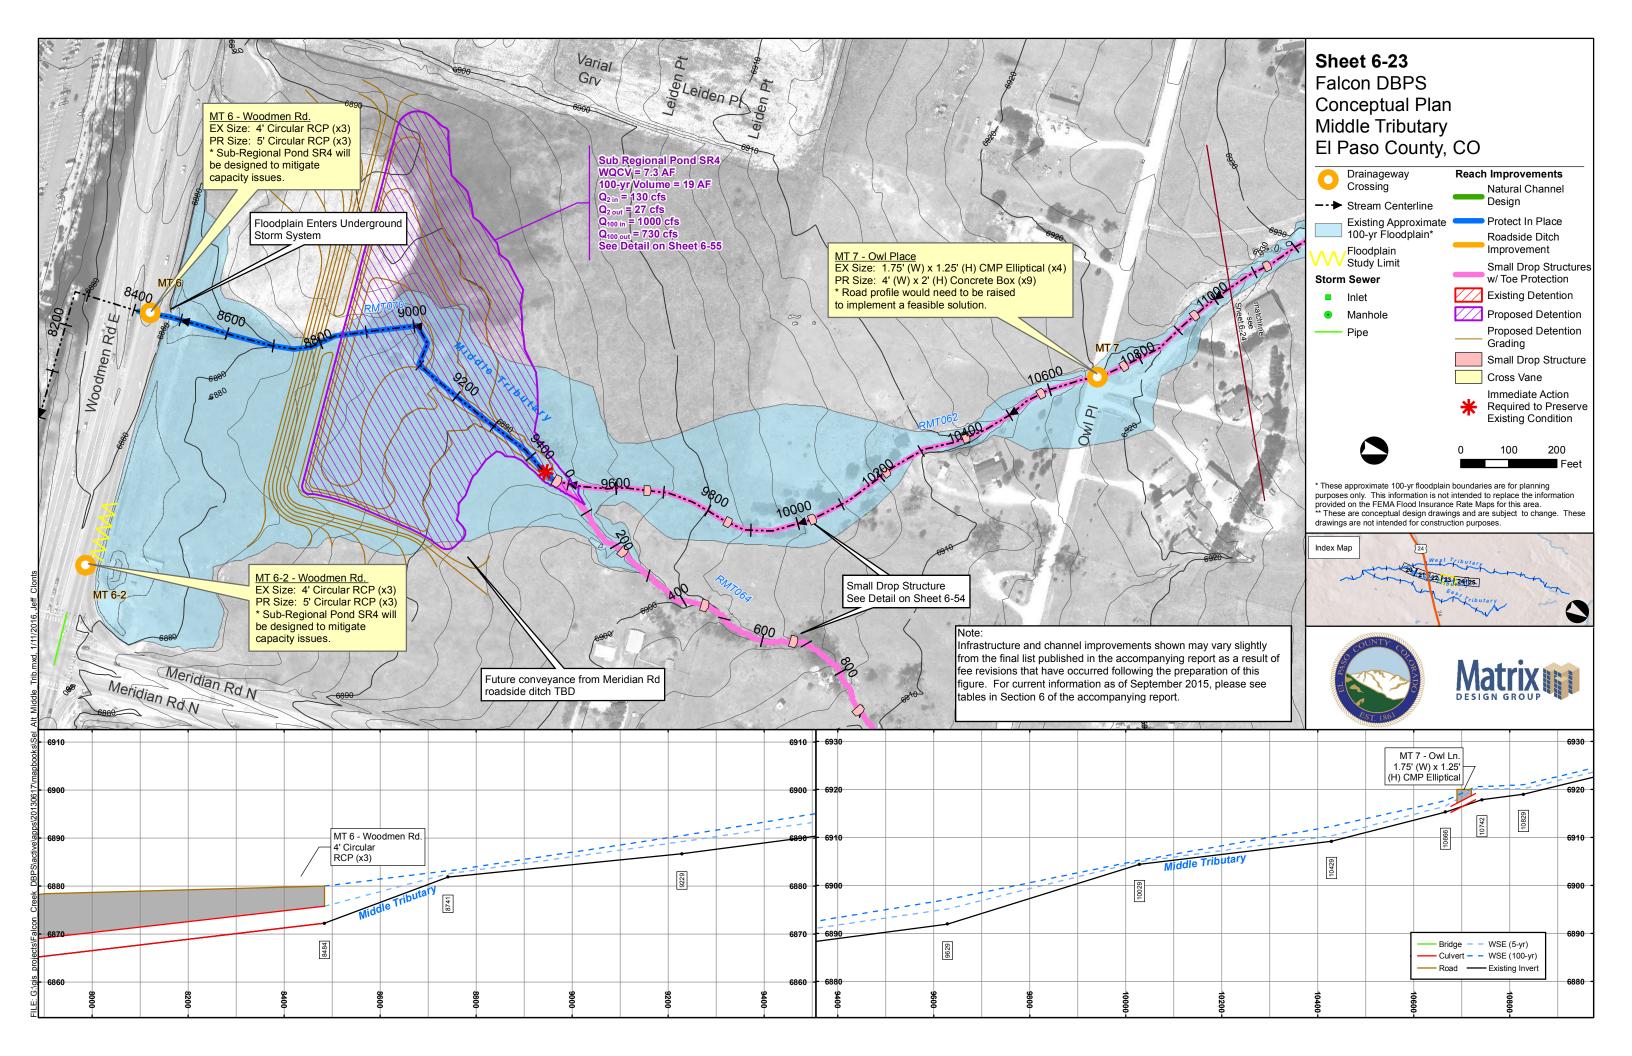

Matrix Project No. 10.122.003

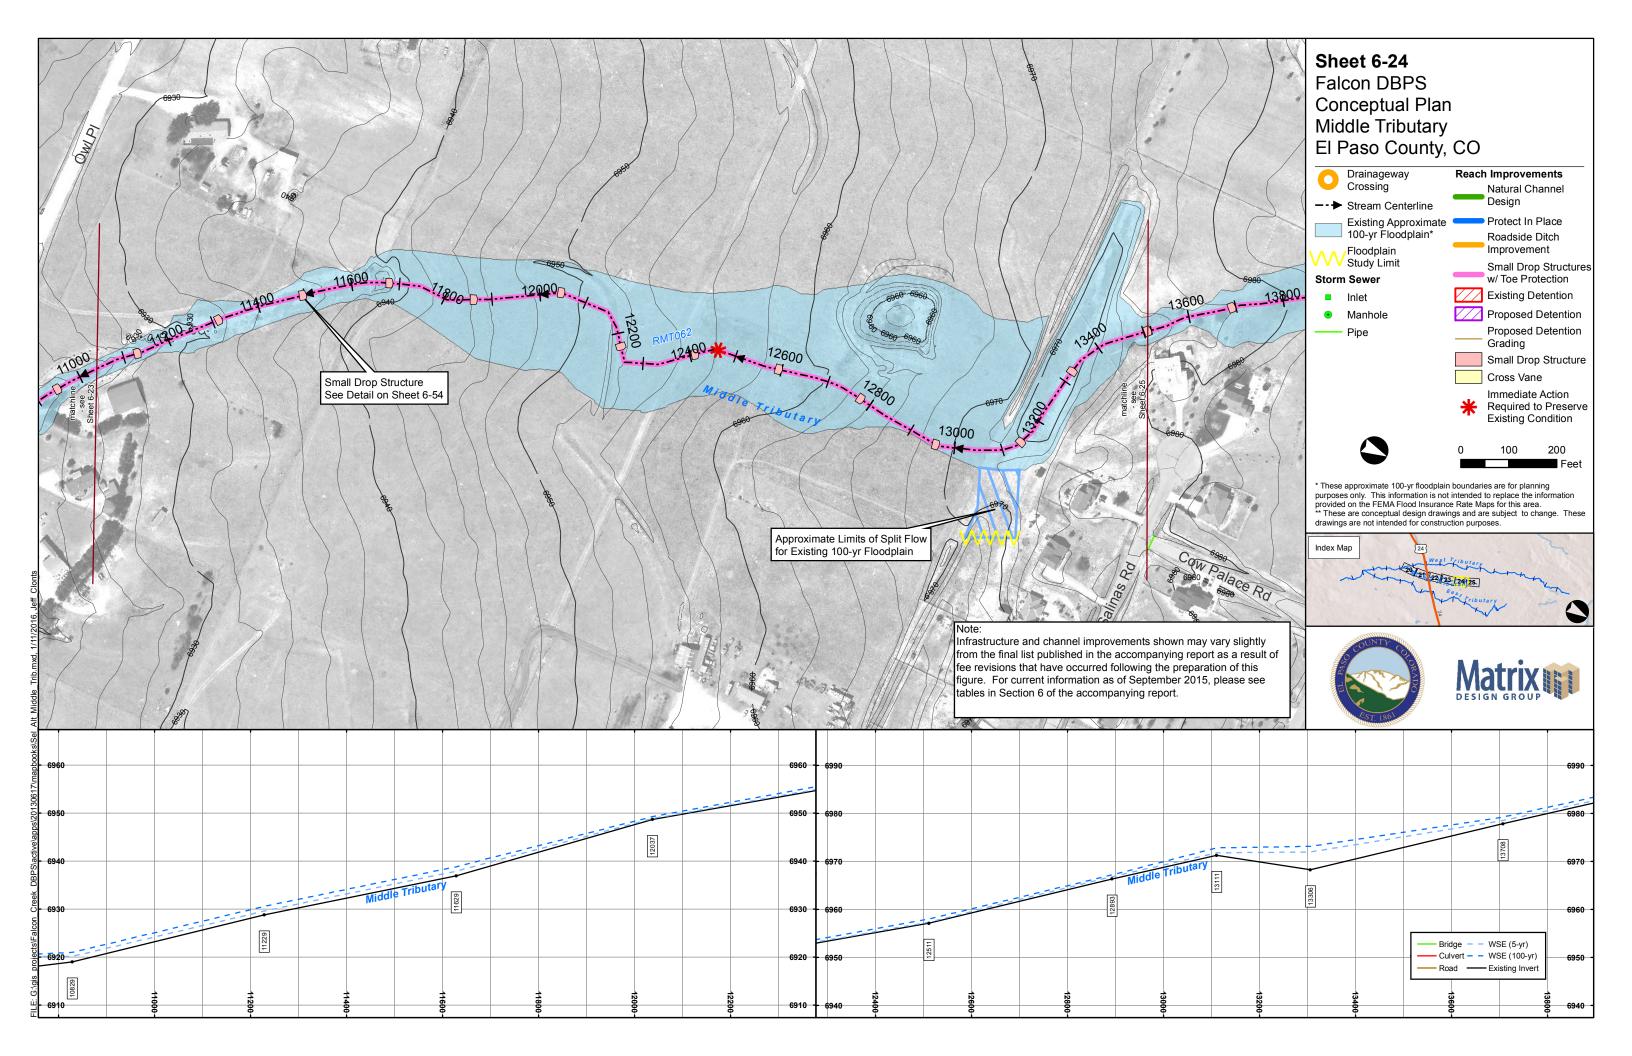

clonts

7.0 FEE DEVELOPMENT

7.1. Introduction

The objective of the fee development exercise was to determine the equitable share of drainage improvement costs that a developer is responsible for paying to El Paso County if they wish to plat a property. This fee is a function of the total cost for the selected plan outlined in Section 6 and will be used by the County to pay for drainage improvements that are necessary as a result of development. The product of this calculation is a unit fee (cost/impervious acre) that is a one-time charge to the developer based on the number of impervious acres within the platted property.

7.2. Developable Land

The Falcon Watershed has a total area of 6,847 acres. The entirety of the watershed is within the County with 1,969 acres unplatted, according to the GIS dataset received from the County. This dataset also includes unplatted areas that can't be developed because of specific land use designations. Table 7-1 provides a summary of land classifications in the Falcon Watershed. A complete summary of unplatted area land use is provided in Appendix E.

Table 7-1. Land Classification		
Classification	Area (acres)	
Platted	3,670	
Unplatted	1,969	
Other	1,208	
Total	6,847	

The projected impervious acreage within unplatted areas totals 645.58 acres. A summary of land classification within the Falcon Watershed is provided in Figure 7-3.

7.3. Fee Calculation & County Cost

The total cost for the Selected Plan was separated into a Development Fee, County Cost, Metropolitan District Cost, and Drainage and Bridge Funds. A description of how the aforementioned were defined is as follows:

- County Cost Drainage improvement costs that are the responsibility of the County as shown in Figure 7-1.
- Metropolitan District Cost Drainage improvement costs that are the responsibility of a metropolitan district as shown in Figure 7-2.
- Development Fee All drainage improvement costs that are directly associated with new development.
- Drainage and Bridge Funds The balance of drainage and bridge funds as of August 2015 was \$584,134 and \$510,777, respectively, with a liability of \$300,000 cost for this DBPS (an additional contract amendment increased the cost of this DBPS to \$339,088).

The anticipated reimbursements due for work completed in the Falcon Watershed are approximately equivalent to the available drainage and bridge funds. As a result, reimbursements were not included in

Falcon DBPS

the fee calculation. Drainage improvements that are required as a result of new development are listed in Appendix E.

The costs apportioned to County and metropolitan district drainage improvements are provided in Table 7-2 and Table 7-3. The bridge improvement fees shown in Table 7-2 and Table 7-3 were determined by classification of the crossing as either a bridge or a culvert. This classification was based on the DCM criteria.

PUDSP-20-005

recommendations from the Falcon DBPS, when additional land is obtained to expand the ROW along the southbound portion of Meridian Road.

In the interim condition, it has been proposed to add a temporary lining to the existing channel to handle the excess velocities and depth associated with the DBPS flows and Bent Grass development re-routed flows. This analysis has been included in the Appendix.

The West Tributary Channel will be natural, vegetated facility, helping to ensure that the overall velocities will be reduced, flow depth will not exceed 5' and minimize any potential for scour. If needed, grade control structures may be designed as proposed in the DBPS to ensure these criteria are met.

3. Implement BMPs That Provide a Water Quality Capture Volume with Slow Release

This step utilizes formalized water quality capture volume to slow the release of runoff from the site. The WQCV will release in no less than 40 hours. On-site water quality control volume detention ponds will provide water quality treatment prior to the runoff being released into the channel. WQCV facilities will be designed as Extended Detention Basins.

The Falcon Meadows at Bent Grass development, west of Bent Grass Residential, Filing No. 1 and No. 2, will include several water quality ponds throughout the site to ensure flows will be treated prior to being released into the West Tributary Channel, running through the site. Only a small area, less than 1.0 acres will not be treated prior to releasing into the channel.

Currently, the existing Meridian Road roadside ditch, ultimately conveys runoff to the existing detention and water quality pond MN, as shown and discussed in the Falcon DBPS. The Falcon DBPS also shows a future detention and water quality pond SR-4 that is to receive flows from basin MT060 and discharge into basin MT070, ultimately routing to existing Pond MN. Flows from Bent Grass Meadows Drive are listed in basin MT060 but are being routed to the existing roadside ditch along Meridian Road, which is in basin MT070. The flows from the "School Site" and upstream basins will release into the east side of Pond SR-4 (west of Falcon Market Place). Pond SR-4 is currently under construction. The proposed improvements impact on the existing drainage basin and both Pond MN and Pond SR-4 are discussed later in the report.

4. Consider Need for Industrial and Commercial BMPs

Source control BMPs for homeowners include the use of garages as the primary area where pollutants can be stored. The single-family detached homes provide garages which can act as storage areas. The proposed development does not include outdoor storage or the potential for introduction of contaminants to the Counties' MS4, thus no targeted source control BMPs are necessary. The biggest source control BMP is public education and discuss topics such as: pet waste, car washing, lawn care, fall leaves, and snow melt and deicer.

Bent Grass East Commercial Filing No. 1 contains commercial development. This area will need to consider the need for Industrial & Commercial BMPs. No industrial uses or outside storage is proposed for this area. Drainage will be routed through water quality ponds prior to leaving the site to minimize contaminants into the public system.

VII. Future Drainage Conditions

MIDDLE TRIBUTARY

Design Point 30 and Basins OS-25 and OS-26 are as described under Existing Drainage Conditions. However, Basins OS-25 and OS-26 now route through proposed "future" detention pond, on what's been previously referred to as the "School Site", north of Bent Grass Meadows Drive and just west of Bent Grass Filing No. 2. This "future" pond will replace the current sedimentation pond on the "School Site". Upon any additional development within the Middle Tributary area of the Bent Grass Development and north of Bent Grass Meadows Drive, this pond will need to be constructed to accommodate the re-routed flows from the Meadows Pond #2 at DP 30.

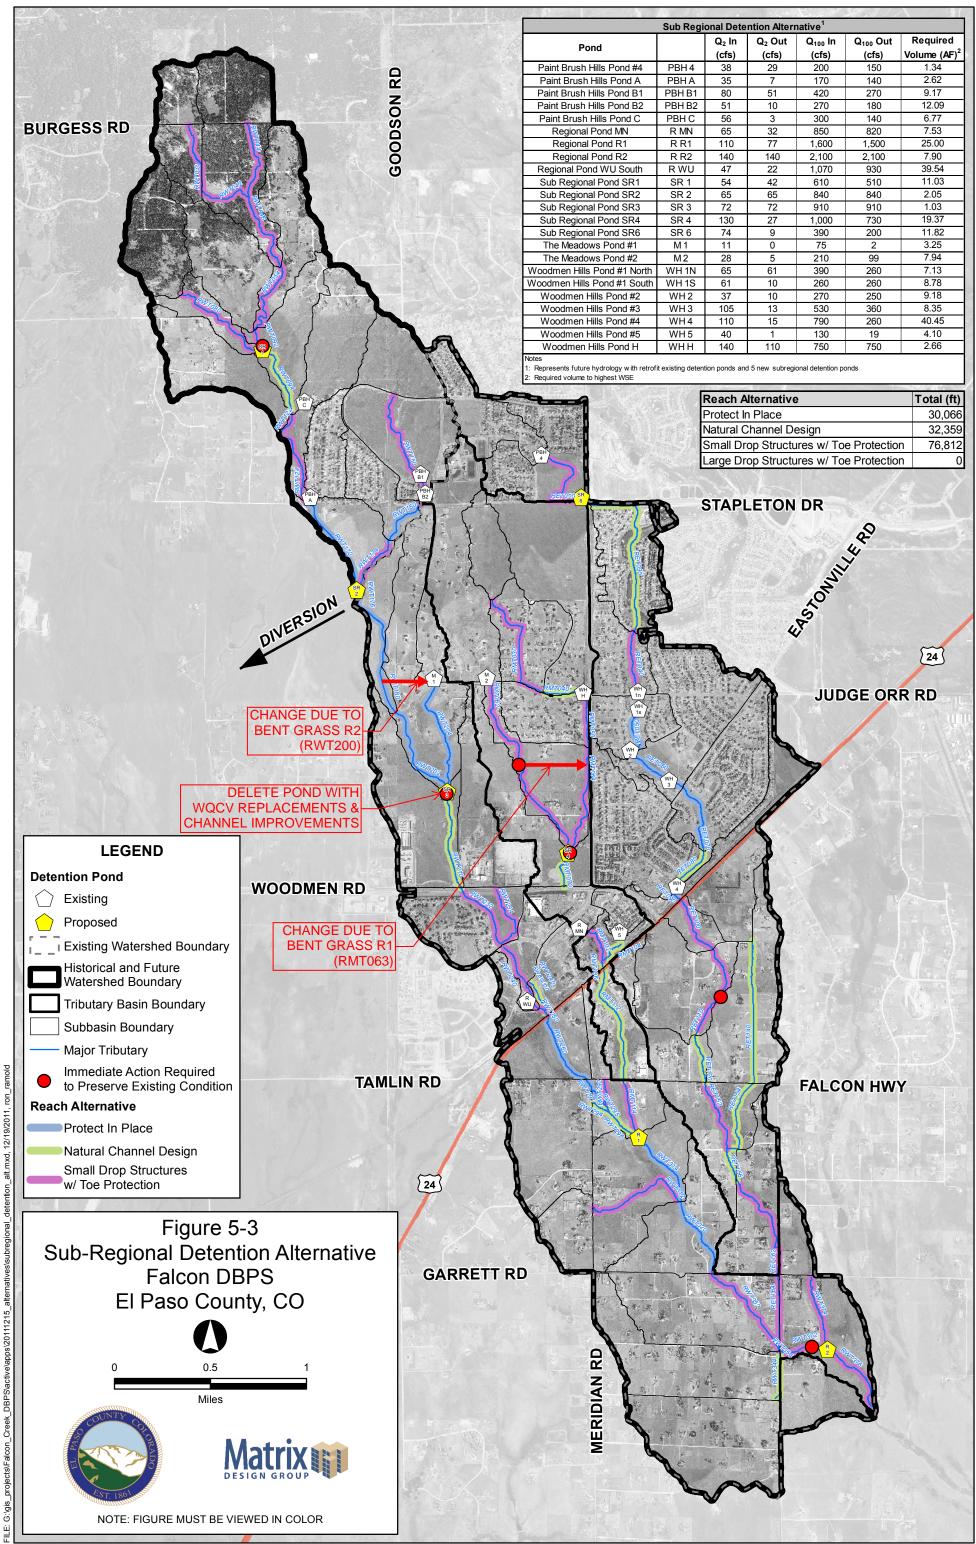

This future facility will need to provide 2.76 ac-ft of water quality, 6.26 ac-ft for EURV and 11.98 ac-ft for 100-year storage volume. Preliminary release rates for the 5 and 100-year storms are 3.8 cfs and 32.2 cfs. These flows were then routed to Bent Grass Meadows to the south. With the decrease in flows, flows will not overtop Bent Grass Meadows Drive and continue east to the future box culvert under Bent Grass Meadows Drive at DP BG20 (5-year flow=292.5 cfs, 100-year flow=909.3 cfs). Flows were still checked against street capacity on the north and south side of Bent Grass Meadows Drive, as it continues to the east. With the construction of the future pond, Bent Grass Meadows Drive will be able to adequately handle the flows and no additional storm infrastructure would need to be built to carry these future developed flows. Any area north of Bent Grass Meadows Drive that will develop in the future will need to provide its own on-site detention. Should future development not be able to release flows into Bent Grass Meadows Drive, a 42" RCP would be able to convey the flows of DP BG 15n (Q100=40.9 cfs, Q5=8.8 cfs) to the northwest corner of the Bent Grass Meadows Drive and Meridian Road intersection. Analysis for this culvert sizing has been included in the appendix.

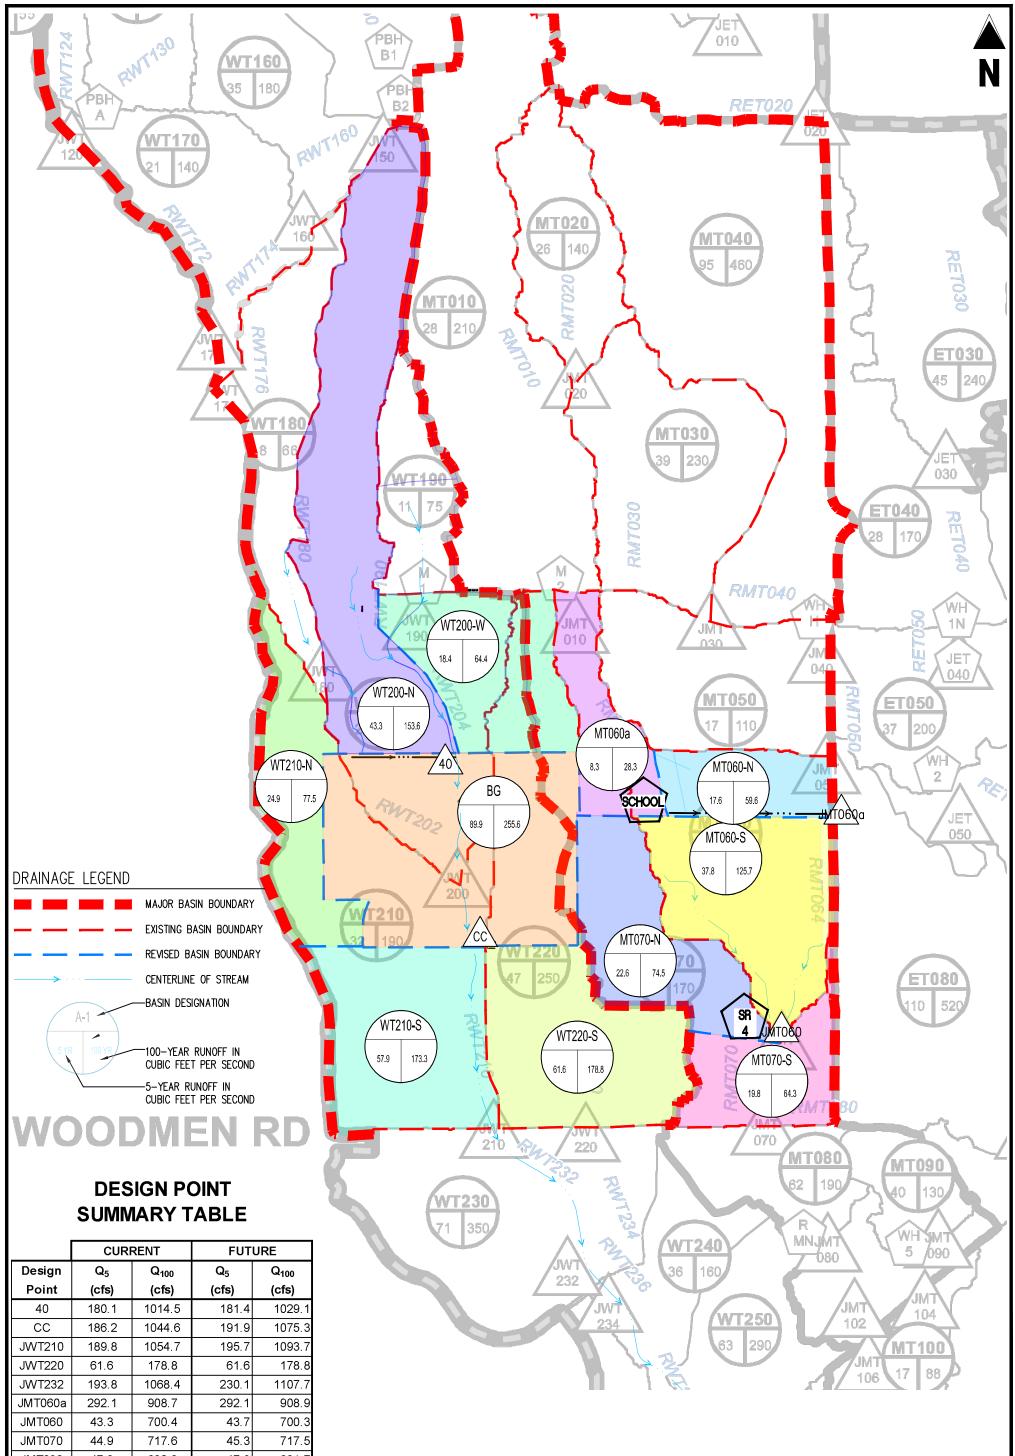

At the Bent Grass Meadows Drive/Meridian Road intersection, the elliptical rcp's will need to be replaced with a double 16' x 4' rcbc. The future roadside ditch will have a 15' wide bottom channel with 4:1 side slope, 6.5' deep and a longitudinal slope of 0.30%. This will result is a flow depth of 5.15' and velocity of 5.04 fps. This channel will direct flows to Owl Place where the existing twin cmp's will be replaced with a 20' x 4' rcbc or equivalent. This structure will need to be built when any development west of Meridian Road at the intersection of Owl Place happens. With future development, it is anticipated that the existing channel conveying flows to the south will be removed to accommodate the new development. The new channel will need to be a 35' wide bottom channel with 4:1 sides, 5' deep and a longitudinal slope of 0.30%. This will produce a flow depth of 3.7' and a velocity of 4.6 fps. If the channel option is not viable, twin 78" rcp's at a minimum 0.50% slope would be able to handle this future flow. Analysis for this design option has been included in the appendix.

Calculations are provided in Appendix C for the future culverts and roadside channel.

WEST TRIBUTARY

Offsite flows entering the west tributary location of Bent Grass have not changed from what was discussed under Current Conditions. Reach RWT202 at the northwest corner of the development has a 100-year flow of 1000 cfs and Reach RWT204 has a flow of 43 cfs. These were obtained from the DBPS by Matrix. The Flood Insurance Study (FIS) by FEMA does not have flows evaluated this far north. The have a flow of 1482 cfs beginning at RWT210. The 8 undeveloped on-site basins for Bent Grass West have been replaced with 17 developed basins. These basins are found in the Falcon Meadows for Bent Grass PDR. A summary of these basins is provided below and are part of the hydrology analysis provided in Appendix B.

DBC Project No. 21611-00BLWR

3.0 HYDROLOGIC ANALYSIS

3.1 Falcon DBPS

The Falcon DBPS completed hydrologic analysis for the Falcon Basin Watershed, using HEC-HMS v3.5 software, for historical, existing, and future land use conditions by applying a 24-hour storm event with 2-, 5-, 10-, 25-, 50-, and 100-year recurrence intervals and current drainage infrastructure. Chapter 3 and Appendix A of the Falcon DBPS include a detailed discussion of the hydrologic analysis. An electronic copy of the HEC-HMS model (File: Aug15_Working_Falcon_DBPS_S.hms) is also provided.

The Falcon DBPS identified Subregional Pond SR4 to be installed on the Falcon Marketplace property. Pond SR4 was constructed in early 2021 and the property floodplain mapping was updated in LOMR Case Number 21-08-0534P.

El Paso County requires regional drainage infrastructure to be sized for future land use conditions. Therefore, peak discharges with existing drainage infrastructure and future land use conditions near Owl Place are summarized in Table 3-1.

Model Location	Physical Location	Branch	Proximity to Owl Place	Q100 (cfs)
JMT050	Bent Grass Meadows Drive	Only East Branch	Upstream of Site	850
JMT060	Eastonville Road (Pond SR4 inflow)	Both East and West Branches	Downstream of Site	1,000

Table 3-1. Future Land Use Conditions Peak Discharges near Falcon Owl Place on
the Middle Tributary, Falcon DBPS

3.2 Falcon Owl Place

The Falcon DBPS HEC-HMS model with existing drainage infrastructure and future land use (Existing Conditions) was used as the basis for the Falcon Owl Place hydrologic analysis. The Existing Conditions model was replicated in HEC-HMS version 4.7.1, due to instabilities and runtime issues with the prior, outdated model version (3.5). The Existing model produced 100-year peak flows of 859 and 1,023 cfs upstream (JMT050) and downstream (JMT060) of the site, which are comparable to and more conservative than the 850 and 1,000 cfs in the DBPS. It should be noted that in Existing Conditions, JMT050 is on the East Branch of the Middle Tributary, whereas JMT060 includes flows from both the West and East Branches, immediately upstream of Pond SR4.

The Falcon watershed did not include a design point on the East Branch immediately upstream of Pond SR4. Therefore, it was necessary to modify the HMS model to obtain a design flow for Owl Place. In the Proposed Conditions basin model, the junction JMT051 was created on the East Branch of the UTBSC at the southern boundary of the Falcon Owl Place property, immediately upstream of Pond SR4.

The lag time and drainage area for Basin MT060 were reduced to 0.077 square miles and 17 minutes, respectively. The length and slope of Routing RMT060 were also updated. The NRCS soils for the proposed basin are Columbine gravelly sandy loam with a Hydrologic Soil Group (HSG) A. The basin is zoned for a combination of 5-acre residential, commercial, and planned unit development (PUD). The nearby PUD (Bent Grass Meadows) is residential with an average lot size of 0.22 acres. Based on TR-55 Table 2-2a, areas with 0.22-acre lots and HSG A have a Curve Number (CN) of 65. However, it is unknown how and when this area will develop in the future. For example, the Owl Place site is currently being rezoned from RR-5 to CS, which would increase the CN from 46 to 89. The future conditions CN of 66 used in the Falcon DBPS is a reasonable representation of the future development potential in the basin and was used in the proposed conditions model.

The hydrologic parameter calculations, base mapping, and select output from the HEC-HMS model is included in **Appendix 4**, and the model files (HEC-HMS file: Falcon_OwlCLOMR.hms) are provided. Proposed peak discharges used for the Falcon Owl Place development are summarized in Table 3-2.

 Table 3-2. Proposed Peak Discharges at Falcon Owl Place (East Branch of the UTBSC)

Recurrence Interval	Q100 (cfs)
100-year	920
5-year	288.5

4.0 HYDRAULIC ANALYSIS

4.1 General

The effective FIRM identifies an approximate Zone A floodplain across the Falcon Owl Place property with no flood profiles, discharges, or BFE's defined. The Falcon Owl Place development includes filling and regrading the site and rerouting the East Branch of the UTBSC through a box culvert across the site.

4.2 Vertical Datum

The effective FIRM is on the North American Vertical Datum of 1988 (NAVD88). The ALTA survey completed for the site (Olsson, 2021) and the design and construction

drawings are on the National Geodetic Vertical Datum of 1929 (NGVD29). The Falcon DBPS and the hydraulic analysis for this CLOMR were both completed on the NGVD29. The difference between the NGVD29 and NAVD88 is 3.8 feet on the Falcon Owl Place.

4.3 Horizontal Datum

The field survey, design, construction drawings and hydraulic modeling for the Falcon Owl Place project were completed on the North American Datum of 1983 (NAD83), Colorado State Plane coordinate system, Central Zone.

4.4 Box Culvert Hydraulic Analysis

Under existing and proposed conditions, the East Branch of the UTBSC leaving the Falcon Owl Place site discharges to Pond SR4 on the Falcon Marketplace. The pond was designed for a 100-year discharge of 1,016 cfs, which includes both West and East branches of the UTBSC. The 100-year water surface elevation upstream of the pond as shown in the LOMR is 6902.5 (NAVD88), or 6898.7 (NGVD29). The starting HGL for the box culvert analysis was conservatively placed at the top of pipe elevation of 6895.84 feet (NGVD29) for analyzing flows to the East branch only. However, an additional analysis was performed with a starting HGL of 6898.7, to evaluate the backwater effects from the pond.

StormCAD was used to evaluate the hydraulic performance of the 10'x6' box culvert. The profile and output for the 100-year storm event is included in **Appendix 5**, and the model files are provided.

4.5 Existing and Proposed Owl Place Culverts

The East Branch of the UTBSC is currently conveyed under Owl Place via two 36" CMP near the northeast corner of the site. The HY-8 software was used to analyze the existing culverts for the 100-year storm event.

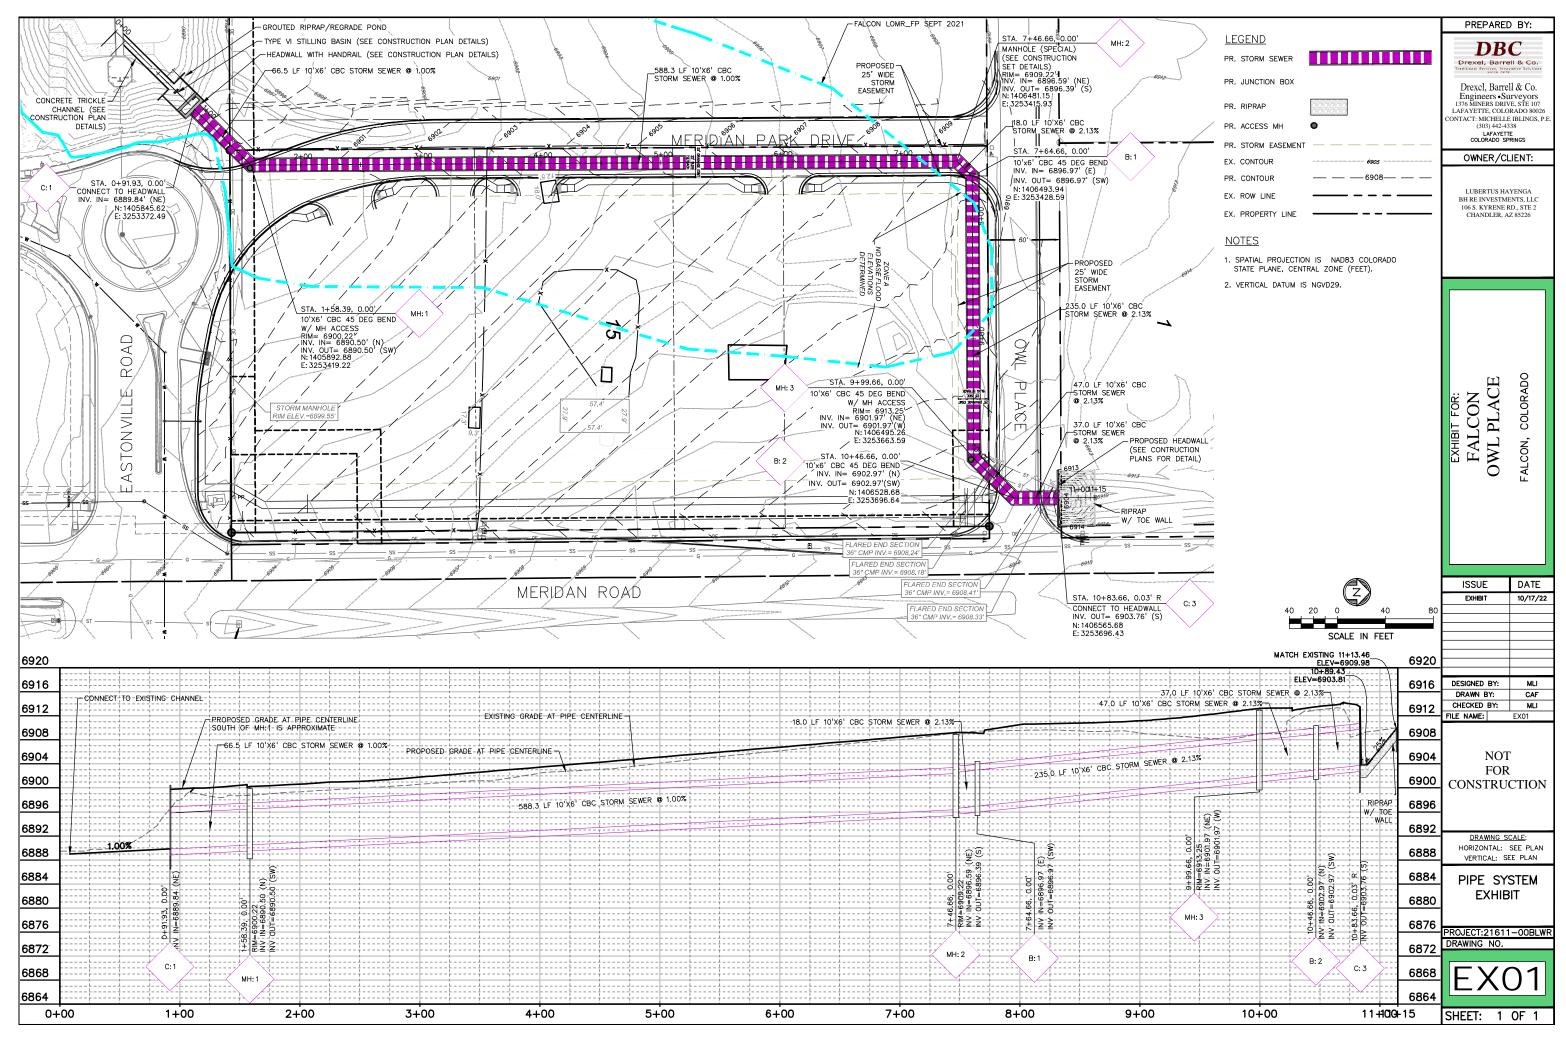

The 2-36" CMP culverts are severely undersized and partially filled with sediment as shown in the photo below. The culverts only convey 86-95 cfs, depending on tailwater depth. The remaining flow (approximately 825-834 cfs) in the 100-year event overtops Owl Place. The proposed box culvert will convey the entire 100-year event (920 cfs) with an HGL of 6911.31 at the proposed headwall upstream of Owl Place, which is more than one foot below Owl Place and contained within the existing and proposed channel upstream. Channel grading will be required for approximately 30 feet to tie into the existing creek profile upstream. The channel side slopes will be reduced from approximately 5.5H:1V to 1.8H:1V and protected with riprap.

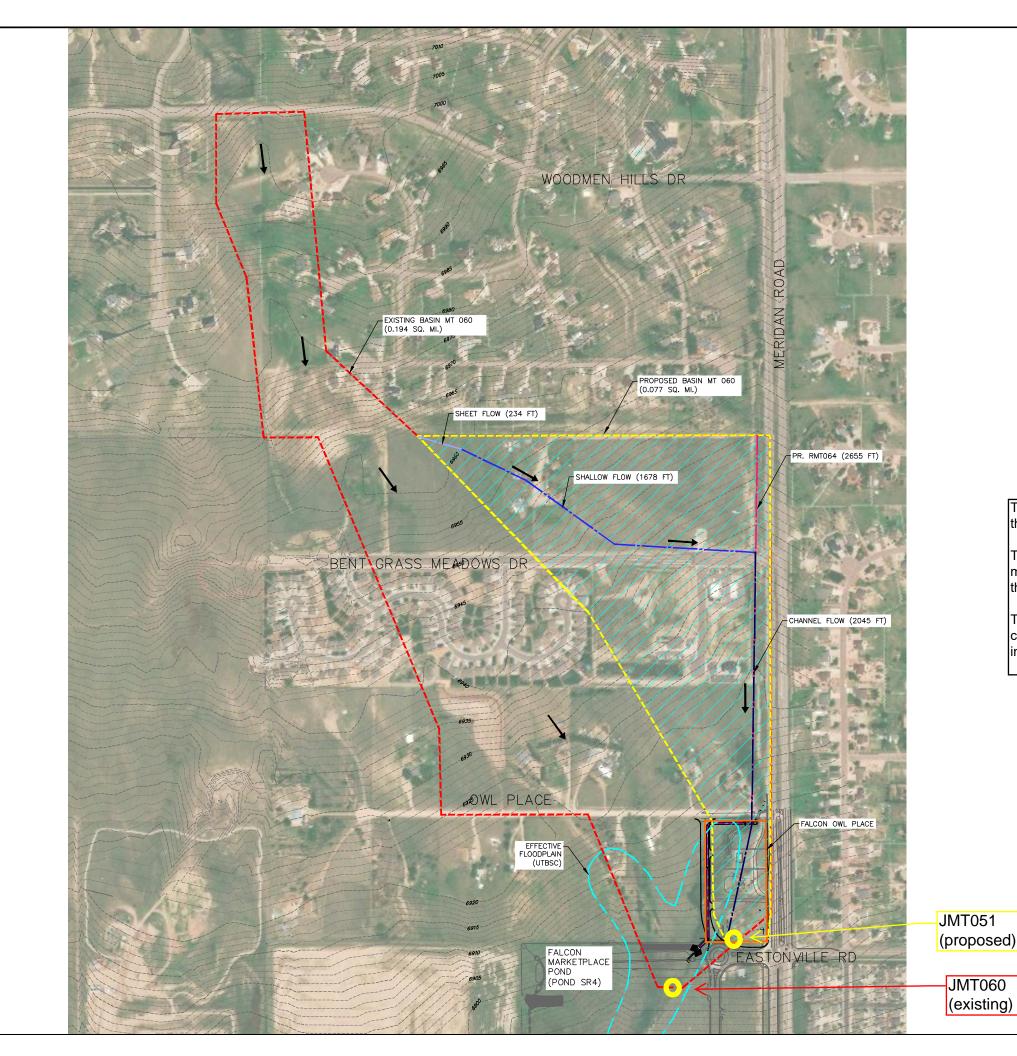

The HY-8 output is included in Appendix 5 and the model file (Owl Place.hy8) is provided.

Unnamed Tributary to Black Squirrel Creek - East Branch (RMT064)

APPENDIX E

Please provide forebay design calculations. The minimum forebay volumes are shown on MHFD T-5 Table EDB-4. The forebay outlet should be sized to release 2% of the undetained peak 100-year discharge.

For projects with two forebay weirs (one notch and one overflow weir that spans wider than the notch), on the UD-BMP spreadsheet use the Forebay Depth to calc the Forebay Discharge Design Flow. But then in a separate spreadsheet, copy over the MHFD's Notch Width formula to calc the notch width using the actual height of the notch (which will be less than the Forebay Depth), instead of the Forebay Depth that the MHFD formula defaults to use.

provide trickle channel and micropool sizing design.

provide spillway riprap size calcs

APPENDIX F

We need to know how much disturbed area is untreated and if there are any exclusions that apply to those areas. So please create a basic overview map (or modify an existing drainage map) with color shading/hatching that shows areas tributary to each PBMP (pond, runoff reduction, etc.) and those disturbed areas that are not treated by a PBMP, with the applicable exclusion labeled (ex: 20% up to 1ac of development can be excluded per ECM App I.7.1.C.1 and exclusions listed in ECM App I.7.1.B.#). An accompanying summary table on this map would also be very helpful (example provided):

Basin ID	Total Area (ac)	Total Proposed Disturbed Area (ac)	Area Trib to Pond A (ac)	Disturbed Area Treated via Runoff Reduction (ac)	Disturbed Area Excluded from WQ per ECM App I.7.1.C.1 (ac)		Applicable WQ Exclusions (App I.7.1.B.#)
Α	4.50	4.50	4.50	-	-	-	
В	1.25	1.25	-	1.00	0.25	-
