# FINAL DRAINAGE REPORT FOR HOMESTEAD AT STERLING RANCH FILING NO. 1

#### **DRAINAGE PLAN STATEMENTS**

#### **ENGINEERS STATEMENT**

The attached drainage plan and report was prepared under my direction and supervision and are correct to the best of my knowledge and belief. Said drainage report has been prepared according to the criteria established by the County for drainage reports and said report is in conformity with the master plan of the drainage basin.

Virgil A. Sanchez, P.E. #37160 For and on Behalf of M&S Civil Consultants, Inc

#### DEVELOPER'S STATEMENT

I, the developer have read and will comply with all the requirements specified in this drainage report and plan.

B TITLE: DATE:

ADDRESS: SR Land, LLC 20 Boulder Crescent, Suite 210 Colorado Springs, CO 80903

#### EL PASO COUNTY'S STATEMENT

Filed in accordance with the requirements of El Paso County Land Development Code, Drainage Criteria Manual Volumes 1 and 2, and the Engineering Criteria Manual, as amended.

BY:	Approved by Elizaben Nikamp El Paso Contry Marining and Community Development on behalf of Jennifer Irvine, County Engineer, ECM Administrator 11/21/2018 1:30:34 PM	DATE:

# FINAL DRAINAGE REPORT FOR HOMESTEAD AT STERLING RANCH FILING NO. 1

### PURPOSE

The purpose of this document is to identify and analyze the on and offsite drainage patterns and to ensure that post development runoff is routed through the site and to downstream facilities in a safe manner that satisfies the requirements set forth by the El Paso County Drainage Criteria Manual and any conditions set forth by the approved master drainage development plans.

### **GENERAL LOCATION AND DESCRIPTION**

Homestead at Sterling Ranch Filing No. 1 is located in the NE <sup>1</sup>/<sub>4</sub> of the NW <sup>1</sup>/<sub>4</sub> of Section 33, Township 12 South, Range 65 West of the 6<sup>th</sup> Principal Meridian, and the SE <sup>1</sup>/<sub>4</sub> of the NW <sup>1</sup>/<sub>4</sub> of Section 33, Township 12 South, Range 65 West of the 6<sup>th</sup> Principal Meridian within unincorporated El Paso County, Colorado. The site is bound on the north by Dines Boulevard and platted Tract C, within the Sterling Ranch development. The property is bound to the east by Dines Boulevard and to the west by existing Vollmer Road. The property is bound to the south by the existing Barbarick Subdivision and Tract BB within the Sterling Ranch. Tract BB is planned for residential development and shall be henceforth referred to as Branding Iron Filing No. 1 at Sterling Ranch. Sterling Ranch lies within the Sand Creek Drainage Basin. Flows from this site are tributary to Sand Creek.

Homestead at Sterling Ranch Filing No. 1 consists of 19.574 acres and is presently undeveloped. Vegetation is sparse, consisting of native grasses. Existing site terrain generally slopes from northwest to south and southeast at grades that vary between 2% and 4%.

Prior to development Homestead at Sterling Ranch Filing No. 1 is presently zoned "RS-5000), but has been identified to contain residential lots within the Sterling Ranch Filing No.1 Plat (Tract G) thereby conforming to the type of development approved Sterling Ranch Preliminary Plan. Improvements proposed for the site include paved, streets, trails, utilities, and storm drainage improvements, as normally required in constructed of a residential development. Onsite water quality is provided by the existing FSD Ponds 4, 8 and W-9 which were constructed with Sterling Ranch Filing No.1 (see MDDPSR).

### SOILS

The soils associated with the drainage area analyzed by this study consist of Pring Coarse Sandy Loam (71) as determined by the mapping provided by the Natural Resources Conservations Service Web Soil Survey. According the information available on the website, this soil has a Hydrologic Soil Group rating of "B". A map showing the proposed site, studied watershed and hydrologic soil group classification is included in the appendix of this report.

### **PREVIOUS STUDIES**

This area was previously studied in the "Sand Creek Drainage Basin Planning Study" (DBPS) prepared by Kiowa Corporation, revised March 1996. More recently the area has been studied in the "Master Development Drainage Report for Sterling Ranch Filing Nos. 1 & 2, and Final Drainage Report for Sterling Ranch Filing Nos.1" prepared by MS Civil Consultants, dated April 2017 (henceforth referred to as MDDPSR) and the Sterling Ranch MDDP revised October 2018.

# HYDROLOGIC CALCULATIONS

Hydrologic calculations were performed using the El Paso County and City of Colorado Springs Storm Drainage Design Criteria manual and where applicable the Urban Storm Drainage Criteria Manual. The Rational Method was used to estimate stormwater runoff anticipated from design storms with 5-year and 100-year recurrence intervals.

# HYDRAULIC CALCULATIONS

Hydraulic calculations were estimated using the Manning's Formula and the methods described in the El Paso County and City of Colorado Springs Storm Drainage Design Criteria manual. The relevant data sheets are included in the appendix of this report.

### FLOODPLAIN STATEMENT

No portion of this site is within a designated F.E.M.A. floodplain as determined by the Federal Emergency Management Agency (FEMA) Flood Insurance Rate Map (FIRM) Panel No. 08041C0535 F, effective date March 17, 1997 and revised to reflect LOMR, 08-08-0541P, dated July 23, 2009. An annotated FIRM Panel is included in the Appendix.

# DRAINAGE CRITERIA

This drainage analysis has been prepared in accordance with the current City of Colorado Springs/El Paso County Drainage Criteria Manual, Volumes I & II, dated November 1991, including subsequent updates. El Paso County has also adopted Chapter 6 and Section 3.2.1 of Chapter 13 in the City of Colorado Springs & El Paso County Drainage Criteria Manual Volumes I and II, dated May 2014. (Appendix I of the El Paso County's Engineering Criteria Manual (ECM), 2008). In addition to the aforementioned ECMs, the Urban Storm Drainage Criteria Manuals, Volumes 1-3, published by the Urban Drainage and Flood Control District (Volumes 1 & 2 dated January 2016, Volume 3 dated November 2010 and updates) have been utilized to aid in design of the Full Spectrum Detention Facilities when required.

# **EXISTING DRAINAGE CONDITIONS**

Homestead at Sterling Ranch Filing No. 1 site consists of 19.574 acres and is situated west of the Sand Creek Watershed. This area was previously studied in the "Sand Creek Drainage Basin Planning Study" (DBPS) prepared by Kiowa Corporation, revised March 1996. More recently the area was studied in the "Master Development Drainage Report for Sterling Ranch Filing Nos. 1&2, and Final Drainage Report for Sterling Ranch Filing Nos. 1 acres and is situated at Sterling Ranch Filing Nos. 1 acres are stored at Sterling Ranch Filing Ranch Filin

Ranch Filing No. 1 and the surrounding areas, with the exception of the existing Barbarick Subdivision, have recently overlot graded. Please refer to the MDDPSR and Sterling Ranch Early Onsite Grading Plan for information on historic conditions and overlot drainage patterns.

### FOUR STEP PROCESS

**Step 1** Employ Runoff Reduction Practices. –Approx. 0.63 trails and landscaped acres within the project ares being set aside for Open Space/Trail use. Roof drains will be directed to side yard swales and as possible to a grass lined swale will be constructed to aid minimize direct connection of impervious surfaces.

**Step 2 Implement BMPs that provide a water quality capture volume with slow release.** – An existing Full Spectrum Detention Facility was planned for this site which will incorporate water quality capture volumes that are intended to slowly drain in 40 hours and excess urban runoff volumes that are intended to drain within 72 hours.

**Step 3 Stabilize streams.** – With the full spectrum detention facility in place, the runoff from the proposed residential development will be reduced to predevelopment conditions. The developed discharge from the site is less that existing and therefore is not anticipated to have negative effects on downstream drainageways.

**Step 4 Consider need for Industrial and Commercial BMPs.** – No industrial or commercial land uses are proposed with this development. The proposed residential development area will implement a Stormwater Management Plan (SWMP) incorporation proper housekeeping procedures. Onsite drainage will be routed through private Full Spectrum Detention (FSD) basins to minimize introduction of contaminates to the county's public drainage systems.

# PROPOSED DRAINAGE CHARACTERISTICS

### **General Concept Drainage Discussion**

The proposed drainage plan for Homestead at Sterling Ranch Filing No. 1 will mimic and formalize the grading patterns established with both the Sterling Ranch MDDP and the Master Development Drainage Report for Sterling Ranch Filing Nos. 1 & 2, and Final Drainage Report for Sterling Ranch Filing No.1 and with its approval allow for the constructing the internal subdivision roadways, utilities, sidewalks and ultimately the placement of homes. With the prior approval of the Sterling Ranch Filing Nos. 1 & 2, and Final Drainage Report for Sterling Ranch Filing No.1, construction plans have been recently approved by El Paso County which have allowed for the construction of the adjacent Dines Boulevard, Filing 1 Storm sewer infrastructure and the formalization of the adjacent Full Spectrum Detention Facilities (Pond Nos. 4, 8 and W-9) and the outlet structures which are needed to collect and convey the developed drainage to the existing channel. It should be noted that the construction of these facilities are occurring during the writing of this report. The following detailed drainage discussion provides an overview of the proposed development drainage analysis and ensures that no alternation of the planned improvements is necessary.

### **Detailed Drainage Discussion**

The following is a description of the onsite basins, offsite bypass flows and the overall drainage characteristics for the development of Homestead at Sterling Ranch Filing No. 1 and the Amendment to

Master Development Drainage Report for Sterling Ranch Filing No. 1 & 2. The development of Homestead at Sterling Ranch Filing No. 1 consists only of the two cul-de-sacs, an eyebrow, roadways, and lots located within the filing boundary. The proposed development drainage patterns and flow values are generally the same as those recommended within the MDDPSR. The following design points and basin results were determined using the Rational Method. Developed surface flow is designated as Design Points (DP) and flow within the storm sewer as (Pipe Run (PR)). To allow for comparison, an **asterisk (\*)** symbol in the detailed drainage discussions below represents each Basin or Design Point as labeled in the Sterling Ranch Filing Nos. 1 & 2 MDDP.

### **Detailed Drainage Discussion (Design Points)**

**DP1**, 2.79 acres, consists of proposed residential lots and streets (Basin A) which have been assigned runoff coefficients of 0.38 for the 5-year and 0.55 for the 100-year events. Developed runoff of 3.6 cfs and 8.7 cfs has been calculated to reach DP1 as shallow overland and street flows in the 5 and 100 year events respectively. A proposed 15' CDOT type R at-grade inlet will intercept flows of Q5=3.6 cfs and Q100=8.6 cfs (PR1)and route them under Wheatland road via a proposed 30" RCP to DP2. Although not accounted for the in the MDDP, the flow-by of approximately 0.1 cfs in the 100 year event (negligible) is not anticipated to adversely affect the downstream infrastructure.

**DP2**, 2.70 acres, consists of proposed residential lots and streets (Basin B) that have been assigned runoff coefficients of 0.38 for the 5-year and 0.55 for the 100-year storm events. Developed runoff of 3.6 cfs and 8.6 cfs has been calculated to reach DP2 as shallow overland and street flows in the two events respectively. A proposed 15' CDOT type R at-grade inlet will intercept flows of Q5=3.6 cfs and Q100=8.5 cfs will combine with flows from PR1 be routed via a 36" RCP (PR2) to an existing 36" RCP stub in the western right of way of existing Dines Boulevard. The cumulative flows in PR2 (Q5=7.1 cfs and Q100=17.2 cfs) are just slightly less than the flows documented in the MDDPSR report (Q5=8.0 cfs and Q100=19.3 cfs) (Aka DP2\*). Similar to the inlet at DP1 flow-by of approximately 0.1 cfs in the 100 year event is anticipated to continue to existing Dines Boulevard. The negligible runoff is not anticipated to adversely affect the downstream infrastructure.

**DP3**, (**Aka DP3\***), 2.92 acres, consists of proposed residential lots and streets (Basin C) that have been assigned runoff coefficients of 0.38 for the 5-year and 0.55 for the 100-year events. Developed runoff of 4.2 cfs and 10.1 cfs has been calculated to reach DP3. A proposed 10' CDOT type R sump inlet and 18" RCP storm pipe will intercept and convey flood flows of Q5=4.2 cfs and Q100=10.1 cfs to an 18" RCP existing stub. The flows in PR3 are equivalent to the flows documented in the MDDPSR report of Q5=4.2 cfs and Q100=10.1 cfs.

**DP4**, (**Aka DP4\***), 9.36 acres, consists of proposed residential lots Basin D (2.9 ac) and Basin E (5.34 ac) with runoff coefficients of 0.38 for the 5-year and 0.55 for the 100-year and 1.12 acres of streets (Basin F, Dines Boulevard) with runoff coefficients of 0.90 for the 5-year and 0.96 for the 100-year. Developed runoff of Q5=16.1 cfs and Q100=36.7 cfs has been calculated to reach DP4. A proposed 15' CDOT type R at-grade inlet will intercepted flows of Q5=13.3 cfs and Q100=20.0 cfs prior to combining with flows from PR3 and routed east via an existing 30" RCP to existing FSD Pond 4. The flows at DP4 are equivalent to the flows documented in the MDDPSR report (Q5=16.1 cfs and Q100=36.7 cfs). Flow-by from DP4 will be routed to DP5.

**DP5**, (**Aka DP5**\*) 0.80 acres, consists of 0.61 acres proposed backyards of residential lots (Basin G) that have assigned runoff coefficients of 0.22 for the 5-year and 0.46 for the 100-year, as well 0.19 acres of Dines Boulevard (Basin H) with runoff coefficients of 0.90 for the 5-year and 0.96 for the 100-year as well as flow by from DP4. Developed runoff of 4.2 and 19.7 cfs has been calculated to reach DP5 in the two events respectively. An existing 15' CDOT type R at-grade inlet at. DP5 will intercept flows of Q5=4.2 cfs and Q100=14.7 cfs. These flows are equivalent to the flows documented in the MDDPSR report (Q5=4.2 cfs and Q100=19.7 cfs). An existing 36" RCP will carry the collected runoff under existing Dines Boulevard towards DP6, while flow-by from DP5 will continue south within Dines Boulevard.

**DP6**, (**Aka DP5**\*) 4.68 acres, consists backyards of residential lots of 0.43 and 0.61 acres in size (Basins OS3 and OS4) that have been assigned runoff coefficients of 0.22 for the 5-year and 0.46 for the 100-year events and 2.1 acre portion of Wheatland Drive and 1.54 acre portion of Dines Boulevard, both with assigned runoff coefficients of 0.90 for the 5-year and 0.96 for the 100-year events. Developed runoff of Q5=14.1 cfs and Q100=26.7 cfs has been calculated to reach DP6. An existing 15' CDOT type R at-grade inlet. These flows are equivalent to the flows documented in the MDDPSR report (Q5=14.1 cfs and Q100=26.7 cfs). Flow-by from DP6 will continue south within Dines Boulevard.

**DP7**, (**Aka DP9\***) 9.73 acres, consists of proposed residential lots of the planned development located east of the subject site (Basin 0S-6) that have been assigned runoff coefficients of 0.38 for the 5-year and 0.55 for the 100-year events. Developed runoff of Q5=12.6 cfs and Q100=30.5 cfs has been calculated to reach DP7. An existing 30" RCP will convey runoff to existing FSD Pond 4. The flows in PR7 are approximately equivalent to the flows documented in the MDDPSR report of Q5=12.5 cfs and Q100=30.4 cfs.

**DP8**,(**Aka DP10**<sup>\*</sup>) 1.97 acres, consists of Basin S (Existing FSD Pond 4) with runoff coefficients of 0.08 for the 5-year and 0.35 for the 100-year and runoff from PR4, PR6 and PR7. Based upon this drainage analysis the total combined developed runoff to reach DP10 at the existing pond will be Q5=49.2 cfs and Q100=105.39 cfs for the 5 and 100 year events respectively, which varies just slightly from the MDDPSR flows of Q5=50.0 cfs and Q100=102.9 cfs that the facility was designed for.

The existing privately maintained facility, as constructed, continues to provide full spectrum detention and water quality for the calculated runoff as planned. The pond will continue to treat approx 27.63 acres, and provide 0.46 ac-ft of water quality storage and 2.915 ac-ft of 100-year storage (refer to UD-Detention worksheet in appendix of this report). According to the updated UD detention worksheet, the slight inflow increase in results in only an increase in the ponding elevation of 0.03' and an increase of 0.6 cfs being released from the pond when compared to the initial design worksheets. Despite the minor increase the pond continues to meet the required drain times and pre-developed flow release rates as necessary with no negative impacts to downstream facilities.

In the event of clogging or total inlet failure, flows at DP8 will over top the existing emergency spillway and outfall into Sand Creek. The existing detention pond will be private and shall be maintained by the Sterling Ranch Metropolitan District (SRMD). Access has been granted to the SRMD and El Paso County for access and maintenance of the private detention pond.

**DP9**,(**Aka DP10**\*) 3.01 acres, consists of 2.71 acres of existing low density residential (Basin OS1A) that have assigned runoff coefficients of 0.08 for the 5-year and 0.35 for the 100-year and 0.31 acres of existing

west half of Vollmer Road (Basin V1A) with assigned runoff coefficients of 0.90 for the 5-year and 0.96 for the 100-year. Developed runoff of Q5=1.6 cfs and Q100=7.0 cfs has been calculated to reach an existing 12" CMP culvert (PR8) at DP9. The runoff shall continue south in its historic drainage pattern via an existing road side swale to DP10.

**DP10** (Aka DP63\*), 9.35 acres, consists of 9.09 acres of existing low density residential (Basin OS1B) that have assigned runoff coefficients of 0.08 for the 5-year and 0.35 for the 100-year and 0.31 acres of the existing west half of Vollmer Road (Basin V1B) with runoff coefficients of 0.90 for the 5-year and 0.96 for the 100-year. Runoff reaching DP10, including flows from DP9, are calculated to be Q5=4.8 cfs and Q100=26.3 cfs in the 5 and 100 year events respectively. Runoff reaching DP 10, is captured by an existing CDOT type D inlet and routed, under Vollmer Road via an existing 24" RCP (PR9). As discussed in the SRMDDP, in the event of clogging, runoff will overtop the local sump condition and the surface runoff shall be routed via historic drainage patterns and an existing road side swale to DP11.

**DP11 (Aka DP 64\*),** 5.85 acres, consists of 5.64 ac existing low density residential (Basin OS1C) with assigned runoff coefficients of 0.08 for the 5-year and 0.35 for the 100-year and approximately 0.21 ac of the existing west half of Vollmer Road (Basin V1C) with assigned runoff coefficients of 0.90 for the 5-year and 0.96 for the 100-year. Runoff reaching DP11 has been calculated to be Q5=2.2 cfs and Q100=12.3 cfs for the 5 and 100 year events respectively. An existing CDOT type C inlet and existing 18" RCP (PR10) route the collected runoff under Vollmer Road. These flows combine with flows within the existing 24" 24" RCP (PR9) before continuing to the south via an existing 30" RCP, (PR11) at flow rates of Q5=7.0 cfs and Q100=38.6 cfs. In the event of clogging, runoff will overtop the sump condition and the surface runoff shall be routed via historic drainage patterns and an existing road side swale to DP12.

**DP12, (Aka DP 64\*)**, 104.75 acres, consists of 94.3 and 10.0 acre basins of existing low density residential (Basin OS1D and Basin W-2), that have been assigned runoff coefficients of 0.08 for the 5-year and 0.35 for the 100-year storm events and 0.13 and 0.32 acre basins of the existing west half of Vollmer Road (Basin V1D and Basin V2) that have been assigned runoff coefficients of 0.90 for the 5-year and 0.96 for the 100-year. Runoff reaching DP12 has been calculated to be 18.9 cfs and 133.7 cfs in the 5 and 100 year events. An existing 4.0'x14.0' modified CDOT type D inlet will collect the runoff and route it under Vollmer Road, via an existing 54" RCP (PR12) to an existing manhole located within a tract east of the Vollmer Road right of way. The flows in PR12 will combine with the flows from PR14 (Q5=7.6 cfs and Q100=47.2 cfs)) and the cumulative flows will be routed east, within the Homestead Sterling Ranch Filing No. 1 subdivision, via a 54" RCP, PR15 (Q5=23.8 cfs and Q100=164.1 cfs). These flows will combine with flows from PR16 (Q5=2.8 cfs and Q100=36.8 cfs, release rate Pond 4) and be routed south via a 60" RCP, PR12 (Q5=26.6 cfs and Q100=200.9 cfs). These flows are nearly equivalent to the SRMDDP runoff rates of (Q5=26.5 cfs and Q100=200.3 cfs) which the pipe was designed. The collected runoff will outfall into an existing low tailwater riprap basin at Sand Creek.

**DP13**, 2.04 acres, consists of a portion of Vollmer Road and (Basin RP-2B) with runoff coefficients of 0.63 for the 5-year and 0.76 for the 100-year storm events. Developed runoff of Q5=2.8 cfs and Q100=5.6 cfs has been calculated to reach DP13. The collected surface runoff will be routed existing via curb and gutter to an existing 6.0' wide CDOT Type 5 embankment protector. An existing riprap apron placed at the

bottom of the rundown provides to dissipate energy and prevent local scour. Runoff is conveyed southerly in an existing earthen swale that leads to existing Detention Pond W-9.

**DP14 (Aka DP61\*)**, 4.03 acres, consists 1.15 acres of rear residential lots with runoff coefficients of 0.22 for the 5-year and 0.46 for the 100-year and 1.60 acres of landscape area and an existing FSD pond (Basin M2) that has been assigned runoff coefficients of 0.08 for the 5-year and 0.35 for the 100-year and 2.04 acres of the eastern half of existing Vollmer Road and adjacent landscaped areas, which have been assigned runoff coefficients of 0.63 and 0.76 for the 5 and 100 year events respectively as well as flows from DP13. Runoff reaching the existing pond at DP 14 is calculated to be Q5=8.9 cfs and Q100=21.2 cfs, which matches the MDDPSR flows of Q5=8.9 cfs and Q100=21.2 cfs that the facility was designed for.

The existing facility functions to provide full spectrum detention and water quality for runoff calculated to reach DP14. The existing pond will treat approx 5.87 acres, and provide 0.092 ac-ft of water quality storage and 0.638 ac-ft of 100-year storage. As described within the MDDPSR the detention facility is private and shall be maintained by the Sterling Ranch Metropolitan District. Access shall be granted to the owner and El Paso County for access and maintenance of the private detention pond. In the event of clogging or total inlet failure, flows at DP14 will over top the emergency spillway and outfall into a proposed swale which will route flows to an existing Vollmer Road side swale. The peak release rates from Pond W-9 (PR13, Q5=0.6 cfs and Q100=8.7 cfs) are conveyed within an existing 18" RCP to and existing 30" RCP ((PR14) (Q5=7.6 cfs and Q100=47.2 cfs)). These flows will be combine with flows from PR12 and be routed east, within the Homestead Sterling Ranch Filing No. 1 subdivision, via a 54" RCP, PR15 (Q5=23.8 cfs and Q100=164.1 cfs). These flows will combine with flows from PR16 (Q5=2.8 cfs and Q100=36.8 cfs, release rate Pond 4) and be routed south via a 60" RCP, PR12 (Q5=26.6 cfs and Q100=200.9 cfs). These flows are nearly equivalent to the SRMDDP runoff rates of (Q5=26.5 cfs and Q100=200.3 cfs) which the pipe was designed. The collected runoff will outfall into an existing low tailwater riprap basin at Sand Creek.

**Basin N** 2.08 acres, consists of proposed residential backyard lots and part of Tract L located along the south boundary of Homestead at Sterling Ranch Filing No. 1 with runoff coefficients of 0.22 for the 5-year and 0.46 for the 100-year. Developed runoff of Q5=1.6 cfs and Q100=5.7 cfs have been calculated for the basin. Runoff from the proposed residential backyard lots will flow to an existing swale that falls along the east boundary of the Barbarick Subdivision. Basin N was part of a larger Basin YY\* that was as discussed in the MDDPSR. The limited developed flows from Basin N that are discharged to the south are considerably less than the historic flows previously directed toward the Barbarick subdivision as can be seen by noting Basin EX-3A in the Sterling Ranch MDDP Existing Conditions Map. As the backyards are typically permeable, and roof drainage from the back of the house shall be directed to the front of the lot water quality treatment will be addressed in the paragraph below.

The flows generated by Basin N and Tract L will be routed south via overlot grading and swales to a temporary sediment basin (future Pond W-5), at the south end of the Sterling Ranch Development. Upon development of the Sterling Ranch Filing No. 2 infrastructure Pond W-5 will be constructed and flows from Basin N and Tract L will be treated as WQCV and Full Spectrum Detention. As such the proposed develop shall not adversely affect the downstream infrastructure.

**Basin O** 0.57 acres, consists of planned residential backyard lots located along the south boundary of Homestead at Sterling Ranch Filing No. 1 that have been assigned runoff coefficients of 0.22 for the 5-year and 0.46 for the 100-year storm events. Developed runoff of, Q5=0.5 cfs and Q100=1.8 cfs is anticipated to be produced by the basin. Runoff from the proposed residential backyard lots will sheet flows towards the planned Branding Iron at Sterling Ranch Filing No. 1 as discussed in the MDDPSR. Basin O was part of a larger Basin GG\* in the MDDPSR. Runoff from basin O and the flow-by from DP1, 2, 5 and 6 will be collected within existing system within existing Dines Boulevard and detained and released at predeveloped flow rates from FSD Pond 4. Refer to Branding Iron at Sterling Ranch filing No.1 FDR for additional information.

#### **DETENTION PONDS**

#### Water Quality/Full Spectrum Detention Facilities

As discussed in the detained drainage summary, developed runoff from Homestead at Sterling Ranch Filing No. 1 is conveyed to existing Full Spectrum Detention Ponds No 4, 8 and W-9 in accordance with the Sterling Ranch Filing Nos. 1&2 MDDP. Based upon the provided analysis the ponds are adequate to serve their intended purpose and require no modification. This is because this final drainage report and the SR Filing 1 and 2 MDDP were nearly concurrent. Thus the larger scale concept planning was very finite and thus allowed for the developed flow rates to align between the two documents and thereby not requiring modifications to facility which is often common between conceptual and final design. The information provided in this report regarding Ponds 8 and W-9 shall supersede the information presented in the MDDP and should be re-referenced with future design.

The flows generated by Basin N and Tract L will be routed south via overlot grading and vegetated swales to a temporary sediment basin (future Pond W-5), at the south end of the Sterling Ranch Development. Upon development of the Sterling Ranch Filing No. 2 infrastructure Pond W-5 will be constructed and flows from Basin N and Tract L will be treated as WQCV (see WQCV deviation request) and Full Spectrum Detention. As such the proposed develop shall not adversely affect the downstream infrastructure.

#### **EROSION CONTROL**

It is the policy of the El Paso County that a grading and erosion control plan be submitted with the drainage report. EPC approved "Early Grading Plan for Sterling Ranch Phase I <u>Onsite</u> Grading & Erosion Control", November 18, 2015. And "Early Grading Plan for Sterling Ranch Phase I <u>Offsite</u> Grading & Erosion Control", December 3, 2015. Grading and Erosion control operations are currently underway (August 2016). Grading and Erosion Control will cease with the final development of the site in the next 12-36 months.

#### **CONSTRUCTION COST OPINION – HOMESTEAD AT STERLING RANCH FILING NO. 1**

#### **Drainage Facilities:**

Minor improvements with the development of Homestead at Sterling Ranch Filing No. 1 are listed below. The majority of the infrastructure construction costs have been accounted for in the "Master Development Drainage Report for Sterling Ranch Filing Nos. 1 & 2, and Final Drainage Report for Sterling Ranch Filing No.1" prepared by MS Civil Consultants, dated April 2017. Please see Drainage and Bridge Fees below.

Item	Description	Quantity	Unit Cost		Cost
1	18" RCP	10	\$40	/LF	\$400.00

M & S Civil Consultants, Inc. (M & S) cannot and does not guarantee the construction cost will not vary

from these opinions of probable costs. These opinions represent our best judgment as design professionals familiar with the construction industry and this development in particular. The above is only an estimate of the facility cost and drainage basin fee amounts in 2017.

#### DRAINAGE & BRIDGE FEES – HOMESTEAD AT STERLING RANCH FILING NO. 1

This site is within the Sand Creek Drainage Basin. The 2017 Drainage and Bridge Fees per El Paso County for the Homestead at Sterling Ranch Filing No. 1site are as follows:

Per Homestead at Ste	erling Ranch Fil	ing No.1	Plat –	Tota	l Area		19.	.574 Acres
FILING NO. 1 FEE Drainage Fees:	2 <b>S:</b> 19.574 x	42%	\$	16,270.00	=		\$	133756.97
Bridge Fees:	19.574 x	42%	\$	4,929.00	=	Total	\$ <u>\$</u>	<u>40,521.70</u> <b>174,278.67</b>

#### SUMMARY

Developed runoff from Homestead at Sterling Ranch Filing No.1 will be conveyed into the existing and proposed drainage systems as shown on the enclosed Drainage Map. The majority of the stormwater will be convey to the south within the proposed rights of way and public storm sewer systems to the Existing Pond No. 4 which will provide full spectrum detention. A small portion of the site adjacent to Vollmer Road will drain to existing Full Spectrum Detention Facility W-9, while a small segment of the development adjacent to Branding Iron at Sterling Ranch Filing No.1 will be collected within existing Dines Boulevard and treated by Full Spectrum Detention Facility No.8. All facilities will discharge runoff to Sand Creek at rates that are equivalent or less than the pre-developed condition in patterns that concur with the both the Sterling Ranch MDDP and the Sterling Ranch filing No.1 and 2 MDDP. As such, the development of this site will not adversely affect the surrounding development and is anticipated to have no negative impact to downstream facilities. The detention facilities treating the runoff from Homestead at Sterling Ranch Filing No.1 and the surface and subsurface improvements to convey runoff located outside the public right of way shall be owned and maintained by the Sterling Ranch Metropolitan District.

# Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.
