Colocation Analysis

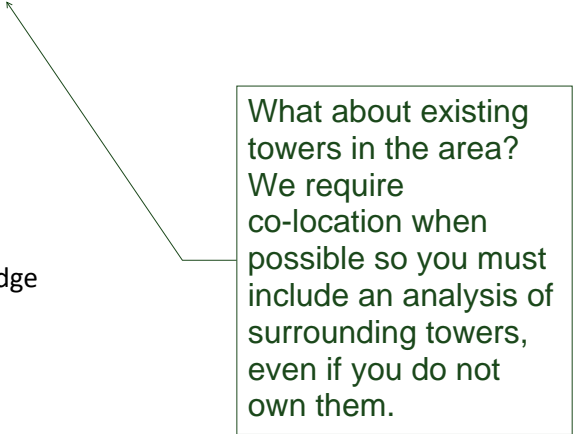

To whom it may concern,

Vertical Bridge has identified an existing 90' monopole tower at Woodmen Hills Elementary School that they would like to replace with a new 90' telecommunications pole to service Falcon, CO and the surrounding areas of El Paso County. This site will provide wireless coverage to the steady-growing population of residents in this vicinity as well as provide improved E911 services to the area. T-Mobile identified this location as the center of their search ring because there was an existing tower. We searched the surrounding area, approximately a one-mile radius and there are no existing structures close to the height of this existing tower. The existing tower can't support the equipment loading of T-Mobile's antennas and we are proposing to replace it with a pole that is structurally capable of carrying our antennas.

Respectfully,

Darren Hunter

What about existing towers in the area?
We require co-location when possible so you must include an analysis of surrounding towers, even if you do not own them.
