GENERAL STRUCTURAL NOTES

1. APPLICABLE CODES
 A. These general notes apply to all structural drawings. This project is designed in accordance with the International Building Code (IBC), 2009 Edition, and the Minimum Design Loads for Buildings and Other Structures (ASCE 7-05) and the Pikes Peak Regional Building Code, (2011 Edition).
 B. All material and workmanship shall be in accordance with applicable provisions of the codes specified above.

2. CONCRETE
 A. Concrete has been designed and shall be constructed in accordance with the American Concrete Institute "Building Code Requirement Reinforced Concrete" and "Specifications for Structural Concrete for Buildings" (ACI 308 and ACI 301) latest editions. Section 13 "Inspection" of ACI 308 is deleted in its entirety, see "Field Observations" paragraph. All concrete shall be of stone aggregate, unless noted otherwise.
 B. **Concrete mixes:**
 See specifications for any additional durability requirements.
 Mix 'A' For drilled piers:
 3000 psi minimum compressive strength at age of 28 days.
 Type I/II Cement, minimum of 410 pounds per cubic yard.
 Fly ash not allowed.
 3/4" maximum aggregate size.
 6" minimum - 8" maximum slump.
 Mix 'B' For footings, grade beams, and miscellaneous concrete:
 4000 psi minimum compressive strength at age of 28 days.
 Type I/II Cement, minimum of 564 pounds per cubic yard.
 3/4" maximum aggregate size.
 6.5% Entrained air.
 4" (8" with superplasticizer) maximum slump.

C. Reinforcing is to be new billet steel ASTM A615, Grade-60, except ties and bars to be welded shall be Grade-40. Provide not less than (7) #5 around all sides of all openings in concrete and extend 2'-0" past edge of opening. No splices of reinforcement are permitted except as detailed or authorized by structural engineer. Where permitted, use contact lap splices, (36) bar diameters minimum. Welded Wire Fabric (WWF) shall be in accordance with ASTM A185. Lap (1) full mesh minimum at splices. No welding of reinforcement permitted unless detailed.
 D. Placing of Reinforcement: Provide chairs, bolsters, additional reinforcement, and accessories necessary to support reinforcement at position shown on drawings. Support of reinforcement on form ties, wood, brick, brickbat or other unacceptable material, will not be permitted.
 E. Reinforcement shall be placed so that the following minimum concrete protection is provided, unless noted otherwise:
 1) Concrete surfaces poured against ground ... 3" Clear
 2) Formed surfaces exposed to ground or weather:
 a) Bars #6 and larger 2" Clear
 b) Bars #5 and smaller 1 1/2" Clear
 3) Slabs at center (uno.)
 4) Concrete not exposed to earth or weather ... 3/4"
 5) Beams, Columns, Ties, Strups or spirals around primary reinforcement, or primary reinforcement with no ties, strups or spirals 1 1/2"

F. The contractor is responsible for determining when it is safe to remove forms and/or shoring. Forms and shoring must not be removed until the walls are strong enough to carry their own weight and any anticipated superimposed loads. For foundation walls, this typically requires at least 12 hours of cumulative curing time at a temperature of 50°F or more. Concrete must be adequately covered during cold periods to maintain this surface temperature. Due to varying weather conditions, alternative curing processes, and the use of Type I/II cement, Rocky Mountain Group suggests forms remain in place a minimum of 3 days to assure the performance specification has been met. When forms are stripped there must be no excessive deflection or discoloration and no evidence of damage to the concrete. Adequate thermal protection of the concrete shall be continued after stripping for a cumulative period of 48 hours at 50°F, or more, after the initial pour. See applicable notes for specifications on when to backfill foundation walls.
 G. Field quality control:
 1) Reference standard: ACI 301 Chapters 16 and 17, latest edition.
 2) Slump tests: The general contractor shall provide necessary equipment and shall make test in conformance with ASTM C143. The contractor shall make slump tests on the first truck of each pour and as often as deemed necessary by the contractor to maintain the required slump tests when directed by the Architect or Engineer.
 3) Control tests:
 a. Control tests of concrete work shall be made on every 50 cubic yards or fraction thereof of concrete placed and, in any case, minimum of once during each day's pour.
 b. Each test shall consist of four standard 6" test cylinders cast and cured in accordance with ASTM C31 and ASTM C172.
 c. Sample concrete at point of placement.
 d. One cylinder shall be broken at end of seven days after placing, two cylinders shall be broken at end of 28 days after placing, and remaining cylinder shall be stored until its disposition is determined by Architect.
 e. In general, remaining cylinder will be broken only when previous test reports indicated unsatisfactory results.
 f. Tests on remaining cylinder shall be at expense of the contractor.
 g. Architect and/or Engineer reserves right to stop future concrete work when seven or 28 day tests indicate unsatisfactory results until, in the opinion of the Architect and/or Engineer of Record proper corrective measures have been taken to insure quality concrete in future work and corrections deemed necessary have been made.
 h. Tests shall be made at time control tests are taken and so stated in reports to determine slump, air content, unit weight and temperature of concrete.
 i. All tests shall be made in accordance with ASTM C138 or ASTM C231.
 4) Slab tolerances: Maintain surface flatness with maximum variation of 1/8 inch in 20 feet.

3. DRILLED PIER FOUNDATIONS
 A. The foundation design has been completed in accordance with pertinent standards, recommended design soil parameters, accepted engineering design procedures, and is based on the best information available at the time of completion. The design is intended to minimize differential movement as described in the reference Geotechnical Report. It shall be recognized that foundation components will undergo movement. It shall be the responsibility of the contractor and/or present owner to inform any subsequent owners of the soil condition and advised to maintain good practices in the future with regard to surface and subsurface drainages, framing of partitions above floor slabs, and finish work above the floor slabs, etc.
 B. Foundation design is based on soil report No. 1526-03 prepared by RMG Engineers dated 11/1/11. The Contractor shall thoroughly review and understand all pertinent construction aspects of this report before beginning any work.
 C. The structure is to be founded on concrete grade beams bearing on drilled piers. Design of drilled piers is based on the following criteria:
 Maximum allowable end bearing pressure 35,000 psf
 Maximum allowable side shear 3,200 psf
 (For the portion of the pier in bedrock and at least 11'-0" below bottom of grade beam)
 Maximum penetration into bedrock 8'-0"
 Minimum total length 40'-0"
 Minimum spacing 3 PIER DIA.
 D. The maximum variation of the center of any drilled pier at its top from the required location shall not be more than 5% of its diameter, and no pier shall be out of plumb more than 1% of its overall length.
 E. A representative of the geotechnical engineer shall provide full time observation of the drilling operation and reinforcement / concrete placement to verify that the soil type and conditions are consistent with design criteria of this soil report. If the soil properties are found to be different from this criteria, the foundation engineer shall be promptly notified so that the foundation design may be revised.
 F. The bottom of all piers shall be thoroughly cleaned and de-aerated prior to concrete placement.
 G. Continuous horizontal bars and corner bars in grade beams supported on piers shall be applied only where necessary for purposes of handling and bar length. Bar splices shall be placed in accordance with the following requirements:
 Bar Location Splice Location Minimum Lap
 Bottom bars at support (36) bar diameters
 Top bars at mid-span (42) bar diameters
 Corner top bars at corner (42) bar diameters
 Other bars staggered (36) bar diameters

4. STRUCTURAL STEEL
 A. Structural steel, including cast in angles, plates or other sections shall be detailed and erected in accordance with the American Institute of Steel Construction (AISC) Specifications and Code of Standard Practice, latest edition.
 B. All wide flange and channel structural steel shall conform to ASTM A992. All other structural shapes and miscellaneous steel shall conform to ASTM A36 unless otherwise noted. Tube steel columns shall conform to ASTM A500, Grade-B. Pipe columns shall conform to ASTM A53.
 C. Shop connections shall be welded with E70xx electrodes and ground smooth where exposed. Field connections shall be made with bolts conforming to ASTM A325N unless otherwise noted. Field welds shall be made with E70xx electrodes. All welding shall be in accordance with AWS "Structural Welding Code", latest edition and performed by certified, licensed welder.
 D. Headed stud anchors shall conform to AWS D11 and shall be automatically end welded.

5. FIELD OBSERVATIONS
 A. The Contractor shall inform the Engineer of Record at least 24 hours prior to casting any concrete so as to allow the Engineer of Record the opportunity to review the placement of reinforcing and/or embedded items. Contact Rocky Mountain Group: (719) 548-0600.
