

FINAL DRAINAGE REPORT

FOR

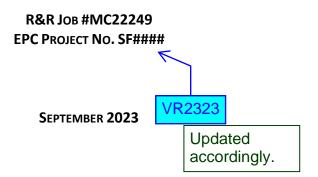

MAYBERRY, COLORADO SPRINGS - FILING NO. 2A

PREPARED FOR:

MAYBERRY COMMUNITIES, LLC 3296 DEVINE HEIGHTS #208 COLORADO SPRINGS, CO 80922

PREPARED BY:

R & R ENGINEERS - SURVEYORS, INC. 1635 W. 13TH AVE, SUITE 310 DENVER, CO 80204 CONTACT: TIM STACKHOUSE, P.E. (303) 753-6730

ENGINEER'S STATEMENT:

The attached drainage plan and report were prepared under my direction and supervision and are correct to the best of my knowledge and belief. Said drainage report has been prepared according to the criteria established by the County for drainage reports and said report is in conformity with the master plan of the drainage basin. I accept responsibility for liability caused by negligent acts, errors, or omissions on my part in preparing this report.

SIGNATURE:	
	Tim Stackhouse, P.E.
	Registered Professional Engineer
	State of Colorado No. 0061924

DEVELOPER'S STATEMENT:

I, the developer, have read and will comply with all of the requirements specified in this drainage report and plan.

SIGNATURE:	
	John Mick
	Colorado Springs Mayberry, LLC
	3296 Devine Heights #208
	Colorado Springs, CO 80922

EL PASO COUNTY'S STATEMENT:

Filed in accordance with the requirements of the El Paso County Land Development Code, Drainage Criteria Manual, Volumes 1 and 2, and Engineering Criteria Manual as amended.

SIGNATURE:		
	Joshua Palmer, P.E.	
	County Engineer/ECM	Administrator

MAYBERRY — FILING 2A FINAL DRAINAGE REPORT

Appendix B – Hydraulic Computations	. 10
Appendix C – Reference Information	. 10

I. GENERAL LOCATION AND DESCRIPTION

A. Background

Mayberry Filing 2A encompasses 4.48 acres southwest of the Springs Road and Highway 94 intersection. Filing 2 Filing 3 is approved and currently under construction. This portion of Engineering. JPS had submitted the narrative has been corrected Drainage Report for Filing 2 whic accordingly.

Later in the report it is stated the Filing 3 FDR is

Final Drainage Report for Mayberry Colorado Springs – Filing No. 3 (referred to as Filing 3 FDR hereon) by R&R Engineers-Surveyors is currently undergoing review by El Paso County and will supersede the Filing 2 report by JPS. Filing 3 FDR will design and size all drainage infrastructure that Filing 2A is tributary to. This Drainage Conformance Letter will include documentation and calculations to support that the new layout of this area is still in compliance with the in process Filing 3 FDR.

approved. Reconcile these statements.

B. Scope

This Drainage Conformance Letter has been requirements for a "Letter Type" drainage r 2, which incorporated a previously approve tributary to the Filing 3 FDR by R&R Engineer

If F3 is finalized after the F2A Project, how will water quality and detention be satisfied? The EDBs must be constructed prior to the construction of Filing 2A if they plan on being utilized to satisfy WQ requirements.

Filing 3 is approved and currently under construction and the pond will be functioning prior to filing 2a. This portion of the narrative has been revised accordingly.

Mayberry Filing 2A proposes a cul-de-sac in place of the previously extended road. The previous design in Filing 2 extended Cattlemen Run through Filing 2, connecting to Positive Place. This cul-de-sac will include a six-inch vertical curb and adjacent sidewalk. Like Filing 2, Filing 2A has three total lots. These lots are configured differently as each lot fronts the cul-de-sac instead of being separated by an intersection.

The report will provide a summary of site drainage issues impacting the proposed development, including analysis of impacts from upstream drainage patterns, site-specific developed drainage patterns, and impacts on downstream facilities. This drainage compliance letter was prepared based on the guidelines and criteria presented in the El Paso County Drainage Criteria Manual, providing design of required drainage facilities for this phase of the project.

MAYBERRY – FILING 2A FINAL DRAINAGE REPORT

C. Site Location and Description

The Mayberry, Colorado Springs (Ellicott Town Center) parcel comprises the west half of Section 14 along with the contiguous east quarter of Section 15, as well the west half of the northeast quarter of Section 14, Township 14 South, Range 63 West of the 6th Principal Meridian. The site is located at an elevation of approximately 6,060 feet above mean sea level. Filing No. 2A comprises 4.48-acres in the north/central area of the Mayberry development.

State Highway 94 borders Filing 2A to the north, Filing 3 to the south and west, and Filing 4 to the east.

The primary access to Filing 2A will be provided by Business Park Drive via Springs Road.

The terrain is generally flat with gentle northwest to southeast slopes ranging from one to two percent. Historic drainage patterns from the site are conveyed overland to the south and east boundaries of the site. The entire site is covered with native grasses.

D. General Soil Conditions

According to the Soil Survey of El Paso County prepared by the Soil Conservation Service, on-site soils are comprised primarily of Blakeland series (type 8) and Truckton series (type 95) soils. Both soils are characterized as well-drained loamy sand with rapid permeability, slow surface runoff rates, and moderate hazard of erosion. These soils are classified as hydrologic soils group "A" for drainage analysis purposes.

II. DRAINAGE BASINS AND SUB-BASINS

A. Major Drainage Basins

The proposed development lies primarily within the Ellicott Consolidated Drainage Basin (CHBS1200) as classified by El Paso County. This basin is comprised of the area tributary to the West Fork of Black Squirrel Creek, with the majority of the basin bounded by SH94 to the north and Ellicott Highway to the east. No drainage planning study has been completed for the Ellicott Consolidated Drainage Basin or any adjacent drainage basins.

The major drainage basins lying in and around the proposed development are depicted in the Phase 1 PUD Amended Drainage Report. Mayberry, Colorado Springs is located primarily within the Ellicott Consolidated Drainage Basin, which comprises a tributary area of about 13 square miles, or 8,320 acres. Filing 2A represents a total of 9.48 acres of development, or less than one percent of the total basin area. An "onsite" drainage planning approach has been proposed in Filing 2A based on the relatively small developed area in comparison to the remaining undeveloped basin area, which is primarily agricultural land.

B. Floodplain Impacts

Mayberry – Filing 2A, Colorado Springs is located approximately one mile southwest of the 100-year floodplain limits for the West Fork of Black Squirrel Creek, as delineated by the Federal Emergency Management Agency (FEMA). The floodplain limits in the vicinity of the site are shown in Flood Insurance Rate Map (FIRM) Number 08041C0810G, dated December 7, 2018.

C. Sub-Basin Description

The developed drainage basins lying within Filing 2A are depicted in Figure D1.1. The interior site layout has been delineated into three drainage basins based on the proposed interior road layout and grading scheme. The natural drainage patterns will be impacted through development by site grading and concentration of runoff in the street gutters, storm drains, and channels. Most sub-basins drain to the southeast, collecting in the interior roadway, Business Park, and drainage channels. On-site flows will be diverted to an extended detention basin (EDB) assumed as existing per the approved Mayberry Filing 3 Final Drainage Report, and detained flows will discharge to the east, following historic drainage paths.

This needs to be verified and updated to match throughout. Above it is stated that the Filing 3 FDR is undergoing review and is not approved.

Filing 3 is approved and currently under construction. Narrative throughout is now consistent.

III. DRAINAGE DESIGN CRITERIA

A. Development Criteria Reference

The Ellicott Consolidated Drainage Basin has not had a Drainage Basin Planning Study performed for the basin. Most areas within the basin are comprised of agricultural lands and rural residential uses.

A "Master Development Drainage Plan (MDDP) for Ellicott Town Center" was approved concurrent with the original Overall PUD, and a Preliminary Drainage Report for Ellicott Town Center Phase One was approved with the original Phase One PUD and Preliminary Plan.

JPS Engineering prepared the "Preliminary & Final Drainage Report for Mayberry, Colorado Springs - Filing No. 1," revised October 27, 2020 (approved by El Paso County November 5, 2020) in support of the final approval and recording of Filing No. 1.

The "Final Drainage Report for Mayberry, Colorado Springs – Filing No. 3" fully conforms to the previously approved MDDP and Preliminary/Final Drainage Reports, along with the "Preliminary Drainage Report Amendment for Mayberry, Colorado Springs Phase 1 PUD" dated February, 2022 prepared in support of the Phase 1 PUD Amendment.

This, "Final Drainage Report for Mayberry, Colorado Springs – Filing No. 2A" fully conforms to the approved "Final Drainage Report for Mayberry, Colorado Springs – Filing No. 3".

B. Hydrologic Criteria

Rational method procedures were utilized for calculation of peak flows within the onsite drainage basins. Rational method hydrologic calculations were based on the following assumptions:

Design storm (minor)Design storm (major)5-year100-year

Rainfall Intensities
 El Paso County I-D-F Curve

Hydrologic soil type A

Composite runoff coefficients for the developed commercial areas have been calculated based *Table 6-6 Runoff Coefficients for Rational Method* in Chapter 6, Section 3.1 in the El Paso County Drainage Criteria Manual. A rational method spreadsheet was utilized for modeling these flows.

MAYBERRY - FILING 2A FINAL DRAINAGE REPORT

C. Hydraulic Criteria

Most of the hydraulic elements of Filing 2A have already been analyzed and provided in the approved Filing 3 Final Drainage Report as it relates to inlet and street capacity and storm pipe capacity. The supporting pages from the Filing 3 Final Drainage Report are provided within the appendix.

One grass lined swale is proposed as part of the Filing 2A development. The swale will be lined in wetland native seed. The grass swale, located along the southern property boundary, was calculated using flow master, the supporting calculation sheet and cross section can be found in Appendix B.

IV. DRAINAGE PLANNING FOUR STEP PROCESS

Please clarify if the construction will be conducted under the original Filing 2A SF1910 ESQCP or if a new ESQCP will be acquired.

El Paso County Drainage Criteria require drainage planning \$\psi\$ A new ESQCP will be acquired for Process for receiving water protection that focuses on reduce Filing 2A. This has been stated treating the water quality capture volume (WQCV), stabilizin here in the report. implementing long-term source controls.

As stated in DCM Volume 2, the Four Step Process is applicable to all new and redevelopment projects with construction activities that disturb 1 acre or greater or that disturb less than 1 acre but are part of a larger common plan of development. The Four Step Process has been implemented as follows in the planning of this project:

Step 1: Employ Runoff Reduction Practices

- Minimize Impacts: The approved Planned Unit Development includes commercial use areas resulting in a moderate level of impervious site development.
- Minimize Directly Connected Impervious Areas (MDCIA): The proposed development will include landscaped areas adjoining the proposed building and parking lots, providing for impervious areas to drain across pervious areas where feasible.
- Grass Swales: The proposed drainage plan incorporates grass-lined swales in selected locations to encourage stormwater infiltration while providing positive drainage through the site.

Step 2: Stabilize Drainageways

Proper erosion control measures will be implemented along the grass-lined drainage swale to provide stabilized drainageways within the site.

Step 3: Provide Water Quality Capture Volume (WQCV)

EDB: This development will drain through an existing Full-Spectrum Extended Detention Basins (EDB) southeast of the developed areas. Site drainage will be

MAYBERRY - FILING 2A

Engineer must confirm in the Drainage Report that the existing offsite or onsite PBMPs that the site is tributary to are functioning as intended. Provide FINAL DRAINAGE REPORT design calcs and verify that the existing pond was designed to accept the proposed flows.

routed through the extended detention basin, which will release the WQCV over an extended release period.

Stormwater detention and WQCV for Filing 2A will be pro EDB-D, designed within the Filing 3 Final Drainage Report.

Step 4: Consider Need for Industrial and Commercial BMPs

Commercial land uses are proposed as part of Filing No. 2 individual commercial site owners for each lot will be enco additional water quality treatment such as grass lined swa permeable pavement, etc. however this is not required if remains in compliance with the pre-determined impervious area set forth in this

The approved routing spreadsheets and drainage maps with Filing 3 FDR has been provided in the appendices within this report. For clarity, the MHFD spreadsheet has been included as well to show that the pond designed within Filing 3 is adequately sized to treat and store Filing 2A runoff.

V. GENERAL DRAINAGE RECOMMENDATIONS

and existing extended detention pond.

The developed drainage plan for the site is to provide and maintain positive drainage away from structures and conform to the established drainage patterns for the overall site. Positive drainage shall be established and maintained away from all structures within the site in conformance with applicable building codes and geotechnical engineering recommendations.

drainage report. Water quality is treated in the down stream grass lined swales

In general, it is recommended that positive drainage slopes should be maintained away from all structures, with a minimum recommended slope of 5 percent for the first 10 feet away from buildings in landscaped areas, a minimum recommended slope of 2 percent for the first 10 feet away from buildings in paved areas, and a minimum slope of 1 percent for paved areas beyond buildings.

VI. DRAINAGE FACILITY DESIGN

A. General Concept

Consistent with generally accepted practices in eastern El Paso County, the general concept for stormwater management from development of Mayberry - Filing 2A will be to construct curb and gutter and a grass swale to connect to the existing storm sewer system, channels, and extended detention basin constructed in Mayberry Filing No. 3.

Runoff from Lot 1A, which includes the existing InteliFab building and associated asphalt parking lot, will drain to Business park primarily through the existing sidewalk chase designed and constructed per the approved Filing 2 construction documents and Final Drainage Report by JPS. Runoff from Lots 2A and 3A will drain toward the

MAYBERRY – FILING 2A FINAL DRAINAGE REPORT

southeast, and be captured by the proposed grass swale. Depending on the future developers' preference for Lots 2A and 3A, he or she can choose to keep the open ditch, or choose to fill in the ditch and replace with an underground storm pipe. Should one lot owner choose to provide an underground storm pipe and the other lot owner choose to keep the provided open ditch, a flared end section must be constructed to keep the positive drainage to the overall stormwater network.

B. Specific Details

Existing Drainage

The existing site spans three basins defined in the Filing 3 FDR: Basins D1.1, D1.13, and D1.14. The site generally drains from northwest to southeast. Undeveloped flows sheet flow generally towards Springs Road and Besseyi Way, ultimately entering multiple existing inlets (Design Points 5B and 7B per Filing 3 FDR). Existing inlets exist near the intersection of Business Park Drive and Springs Road and the intersection of Besseyi Way and Springs Road. An existing 24" RCP stub exists in the southwest corner of the site. There is no other existing stormwater conveyance infrastructure currently on site (piping, inlets, channels, etc) and no detention/water quality facilities existing on the site.

Proposed Drainage

The proposed site is split between Filing 3 FDR Basins D1.1, D1.13, and D1.14. Runoff from the site will generally flow northwest to southeast and flow into either Business Park Drive or a swale on the southern property line, ultimately being conveyed to the existing storm sewer system.

Pond D (designed with Filing 3 FDR) has been designed to detain and treat flows from the entirety of Filing 2A. Therefore, no stormwater quality or detention facilities will be installed on the site of Filing 3 is not constructed/approved by the time Filing 2A is discussion the need for stormwater

Basin D1.1 is a 1.73 acre basin originally defined in the Filing 3 FDR. It comprises the southern commercial devel southern property line and flared end section in the southers the existing storm sed developed peak flows are 6

Basin D1.13 is a 3.07 acre basin originally defined in the Filing 3 FDR. It comprises the northern commercial development of Filing 2A and a portion of Springs Road. The basin ultimately drains into existing storm sewer system within Springs Road via an

MAYBERRY – FILING 2A FINAL DRAINAGE REPORT

existing Type R curb inlet at design point 7B. The 5 year and 100 year developed peak flows are 9.2 and 17.6 cfs respectively.

Basin D1.14 is a 0.91 acre basin originally defined in the Filing 3 FDR. It comprises the south eastern commercial portion of Filing 2 and a portion of single family housing in Filing 3. The basin drains into Springs Road and is collected by an existing Type R curb inlet at design point 5B near the intersection of Besseyi Way and Springs Road. The 5 year and 100 year developed peak flows are 1.8 and 3.9 cfs respectively.

C. Comparison of Developed to Filing 3 FDR

The development of Filing 2A is in compliance with Filing 3 FDR in regard to both impervious percentages and peak flows. All Filing 2A impervious percentages and peak flows are equal to or below the limits listed in Filing 3 FDR. The following table provides a comparison of these value.

	Basir	n D1.1	Basin	D1.13	Basin D1.14					
	Filing 3	Filing 2A	Filing 3	Filing 2A	Filing 3	Filing 2A				
5 Year Flow	6.7	6.7	10.9	9.2	1.8	1.8				
100 Year Flow	12.2	12.2	19.9	17.6	3.9	3.9				
% Impervious	95%	95%	95%	80%	64%	64%				

D. Onsite Drainage Facility Design

Curb and Gutter

Basin D1.13 will drain towards Business Park and be captured by the existing and proposed curb and gutter. Business Park is pitched to drain toward the east, and be ultimately captured by the existing cross pan designed and constructed per the Filing 2 plans by JPS. Flows will continue south and be captured by the existing type R inlet designed and constructed per the approved Filing 3 plans. The cross section of Business Park is designed as the typical 2%, pushing water from the centerlines to curb and gutter systems.

Open Channel System Layout

One grass swale is proposed as part of the Filing 2A development located along the southern boundary which will capture all stormwater runoff from lots 2A and 3A. The V-shaped swale is designed with side slopes of 4:1. The swale will convey stormwater runoff to the southeast corner of the Filing 2A boundary, and ultimately to the existing stormwater network designed within Filing 3.

MAYBERRY - FILING 2A FINAL DRAINAGE REPORT

E. Analysis of Existing and Proposed Downstream Facilities

The general concept of the proposed drainage plan is to attenuate peak flows from the developed site by routing flows to the existing detention pond, Pond D. An analysis of drainage patterns downstream of the subdivision was parformed as part of the approved Filing 3 is approved and currently Filing 3 report to ensure historic drainage patterns are r under construction. Narrative in compliance with Filing 3, as the developed flows ass throughout is now consistent. equal or below what was anticipated within the approve

Is the pond existing? Previously it was stated Filing 3 FDR F. Anticipated Drainage Problems and Solutions to been finalized let alone the pond constructed.

The existing stormwater detention pond is designed to mitigate the impacts of developed drainage from this project. The overall drainage plan for Filing 2A includes a public street with curb and gutter, an existing cross-pan at Business Park and Springs Road, an existing sidewalk chase, and a grass swale. The primary drainage problems anticipated within this development will consist of maintenance of the sidewalk chase and drainage swale. Care will need to be taken to implement proper erosion control measures in the proposed swale, which will be designed to meet allowable velocity

criteria.

Are 100 year flows contained within the sidewalk chase? Revise to discuss if current chase is adequate to prevent overtopping on sidewalk.

VII. **EROSION CONTROL**

The Contractor will be required to implement best ma erosion control during construction. The proposed er the Grading & Erosion Control (GEC) Plans submitted drawings. Erosion control measures will include insta disturbed slopes and hay bales protecting drainage di stabilized during excavation if necessary and vegetation stabilization of the disturbed areas. All ditches have b County criteria for slope and velocity. Additionally, a graver venucie tracking pad will be

The sidewalk chase, that is existing per the approved Mayberry Filing 2 plans by JPS, is sized adequately to accomodate the 100-year storm. The narrative has been enhanced to discuss this and a calc is added to the appendices.

installed at construction access point and inlet protection will be provided to minimize conveyance of sediment into storm inlets.

VIII. COST ESTIMATE AND DRAINAGE FEES

The developer will pay all capital costs for roadway and drainage improvements. As detailed in Appendix C. The engineer's estimate for Filing 2A drainage improvements is approximately \$627.90. Filing 2A is located entirely within the Ellicott Consolidated Drainage Basin, which currently does not have a drainage or bridge fee requirement. As

MAYBERRY – FILING 2A FINAL DRAINAGE REPORT

such, no drainage basin fees are applicable.

IX. MAINTENANCE

All proposed road and drainage construction within the Mayberry – Filing 2A, Colorado Springs project will be performed to El Paso County Standards. Interior roads will be dedicated as public right-of-way. Roads and drainage facilities within the public right-of-way will be maintained by El Paso County upon final acceptance of these facilities after the warranty period. The Metropolitan District will maintain drainage channels and stormwater detention pond within the proposed open space areas.

X. SUMMARY

The Mayberry – Filing 2A, Colorado Springs consists of 3 commercial lots in the northwest of Springs Road and Business Park, with access connections to State Highway 94 at Springs Road. The commercial lots are platted within Filing 2A. The development will generate an increase in developed runoff from the site, which will be mitigated through an existing stormwater detention and water quality facility designed and constructed within Filing 3, which accounted for these developed flows.

The proposed drainage patterns will remain consistent with historic conditions, and new drainage facilities constructed to El Paso County standards will safely convey runoff to adequate outfalls. The existing detention pond, Pond D southeast of the development areas will ensure that developed flows remain below historic levels. Construction and proper maintenance of the proposed drainage and erosion control facilities will ensure that this development has no significant adverse drainage impacts on downstream or surrounding areas.

The maps do not show the small areas of A/D Streams and Canals contrasting soils that could have been shown at a more detailed Transportation B/D Rails ---Please rely on the bar scale on each map sheet for map measurements. Interstate Highways C/D Source of Map: Natural Resources Conservation Service **US Routes** Web Soil Survey URL: D Major Roads Coordinate System: Web Mercator (EPSG:3857) Not rated or not available -Local Roads Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts Soil Rating Lines Background distance and area. A projection that preserves area, such as the Aerial Photography Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required. This product is generated from the USDA-NRCS certified data as of the version date(s) listed below. Soil Survey Area: El Paso County Area, Colorado Survey Area Data: Version 20, Sep 2, 2022 Soil map units are labeled (as space allows) for map scales 1:50.000 or larger. Not rated or not available Date(s) aerial images were photographed: Sep 11, 2018—Oct 20. 2018 **Soil Rating Points** The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background A/D imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident. B/D

Hydrologic Soil Group

Map unit symbol	Map unit name	Rating	Acres in AOI	Percent of AOI	
8	Blakeland loamy sand, 1 to 9 percent slopes	А	1.2	23.2%	
95	Truckton loamy sand, 1 to 9 percent slopes	A	3.9	76.8%	
Totals for Area of Interest			5.0	100.0%	

Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

Rating Options

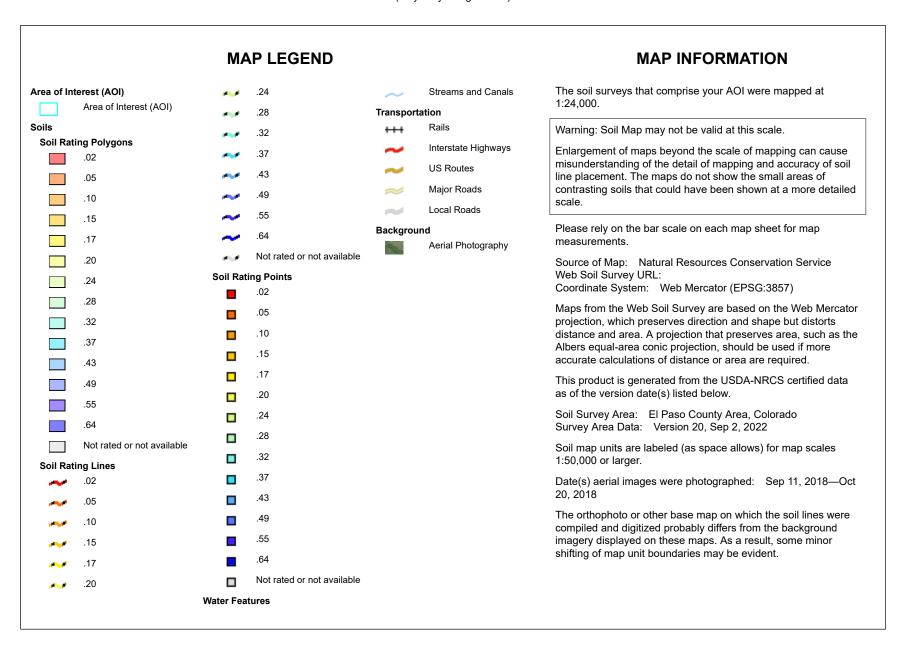

Aggregation Method: Dominant Condition

Component Percent Cutoff: None Specified

K Factor, Whole Soil

Map unit symbol	Map unit name	Rating	Acres in AOI	Percent of AOI
8	Blakeland loamy sand, 1 to 9 percent slopes	.10	1.2	23.2%
95	Truckton loamy sand, 1 to 9 percent slopes	.24	3.9	76.8%
Totals for Area of Interest			5.0	100.0%

Description

Erosion factor K indicates the susceptibility of a soil to sheet and rill erosion by water. Factor K is one of six factors used in the Universal Soil Loss Equation (USLE) and the Revised Universal Soil Loss Equation (RUSLE) to predict the average annual rate of soil loss by sheet and rill erosion in tons per acre per year. The estimates are based primarily on percentage of silt, sand, and organic matter and on soil structure and saturated hydraulic conductivity (Ksat). Values of K range from 0.02 to 0.69. Other factors being equal, the higher the value, the more susceptible the soil is to sheet and rill erosion by water.

"Erosion factor Kw (whole soil)" indicates the erodibility of the whole soil. The estimates are modified by the presence of rock fragments.

Factor K does not apply to organic horizons and is not reported for those layers.

NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The community map repository should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where Base Flood Elevations (BFEs) and/or floodways have been determined, users are encouraged to consult the Flood Profiles and Floodway Data and/or Summary of Stillwater Elevations tables contained within the Flood Insurance Study (FIS) report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS report should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

Coastal Base Flood Elevations shown on this map apply only landward of 0.0' North American Vertical Datum of 1988 (NAVD88). Users of this FIRM should be aware that coastal flood elevations are also provided in the Summary of Stillwater Elevations table in the Flood Insurance Study report for this jurisdiction. Elevations shown in the Summary of Stillwater Elevations table should be used for construction and/or loodplain management purposes when they are higher than the elevations shown or

Boundaries of the floodways were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for

Certain areas not in Special Flood Hazard Areas may be protected by flood control structures. Refer to section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures for this jurisdiction.

The projection used in the preparation of this map was Universal Transverse Mercator (UTM) zone 13. The horizontal datum was NAD83, GRS80 spheroid. Differences in datum, spheroid, projection or UTM zones zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of this FIRM.

Flood elevations on this map are referenced to the North American Vertical Datum of 1988 (NAVD88). These flood elevations must be compared to structure and ground elevations referenced to the same vertical datum. For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website a http://www.ngs.noaa.gov/ or contact the National Geodetic Survey at the following

NGS Information Services NOAA, N/NGS12 National Geodetic Survey SSMC-3, #9202 1315 East-West Highway Silver Spring, MD 20910-3282

To obtain current elevation, description, and/or location information for bench marks shown on this map, please contact the Information Services Branch of the National Geodetic Survey at (301) 713-3242 or visit its website at http://www.ngs.noaa.gov/.

Base Map information shown on this FIRM was provided in digital format by El Paso County, Colorado Springs Utilities, and Anderson Consulting Engineers, Inc. These data are current as of 2008.

This map reflects more detailed and up-to-date stream channel configurations and floodplain delineations than those shown on the previous FIRM for this jurisdiction. The floodplains and floodways that were transferred from the previous FIRM may have been adjusted to conform to these new stream channel configurations. As a result, the Flood Profiles and Floodway Data tables in the Flood Insurance Study Report (which contains authoritative hydraulic data) may reflect stream channel distances that differ from what is shown on this map. The profile baselines depicted on this map represent the hydraulic modeling baselines that match the flood profiles and Floodway Data Tables if applicable, in the FIS report. As a result, the profile baselines may deviate significantly from the new base map channel representation

Corporate limits shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

Please refer to the separately printed Map Index for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is

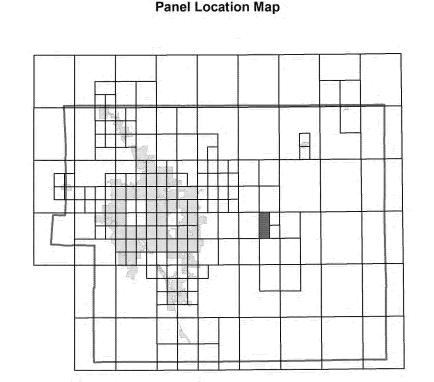

Contact FEMA Map Service Center (MSC) via the FEMA Map Information eXchange (FMIX) 1-877-336-2627 for information on available products associated with this FIRM. Available products may include previously issued Letters of Map Change, a Flood Insurance Study Report, and/or digital versions of this map. The MSC may also be reached by Fax at 1-800-358-9620 and its website at http://www.msc.fema.gov/.

f you have questions about this map or questions concerning the National Flood Insurance Program in general, please call 1-877-FEMA MAP (1-877-336-2627) or visit the FEMA website at http://www.fema.gov/business/nfip.

El Paso County Vertical Datum Offset Table

Vertical Datum Flooding Source

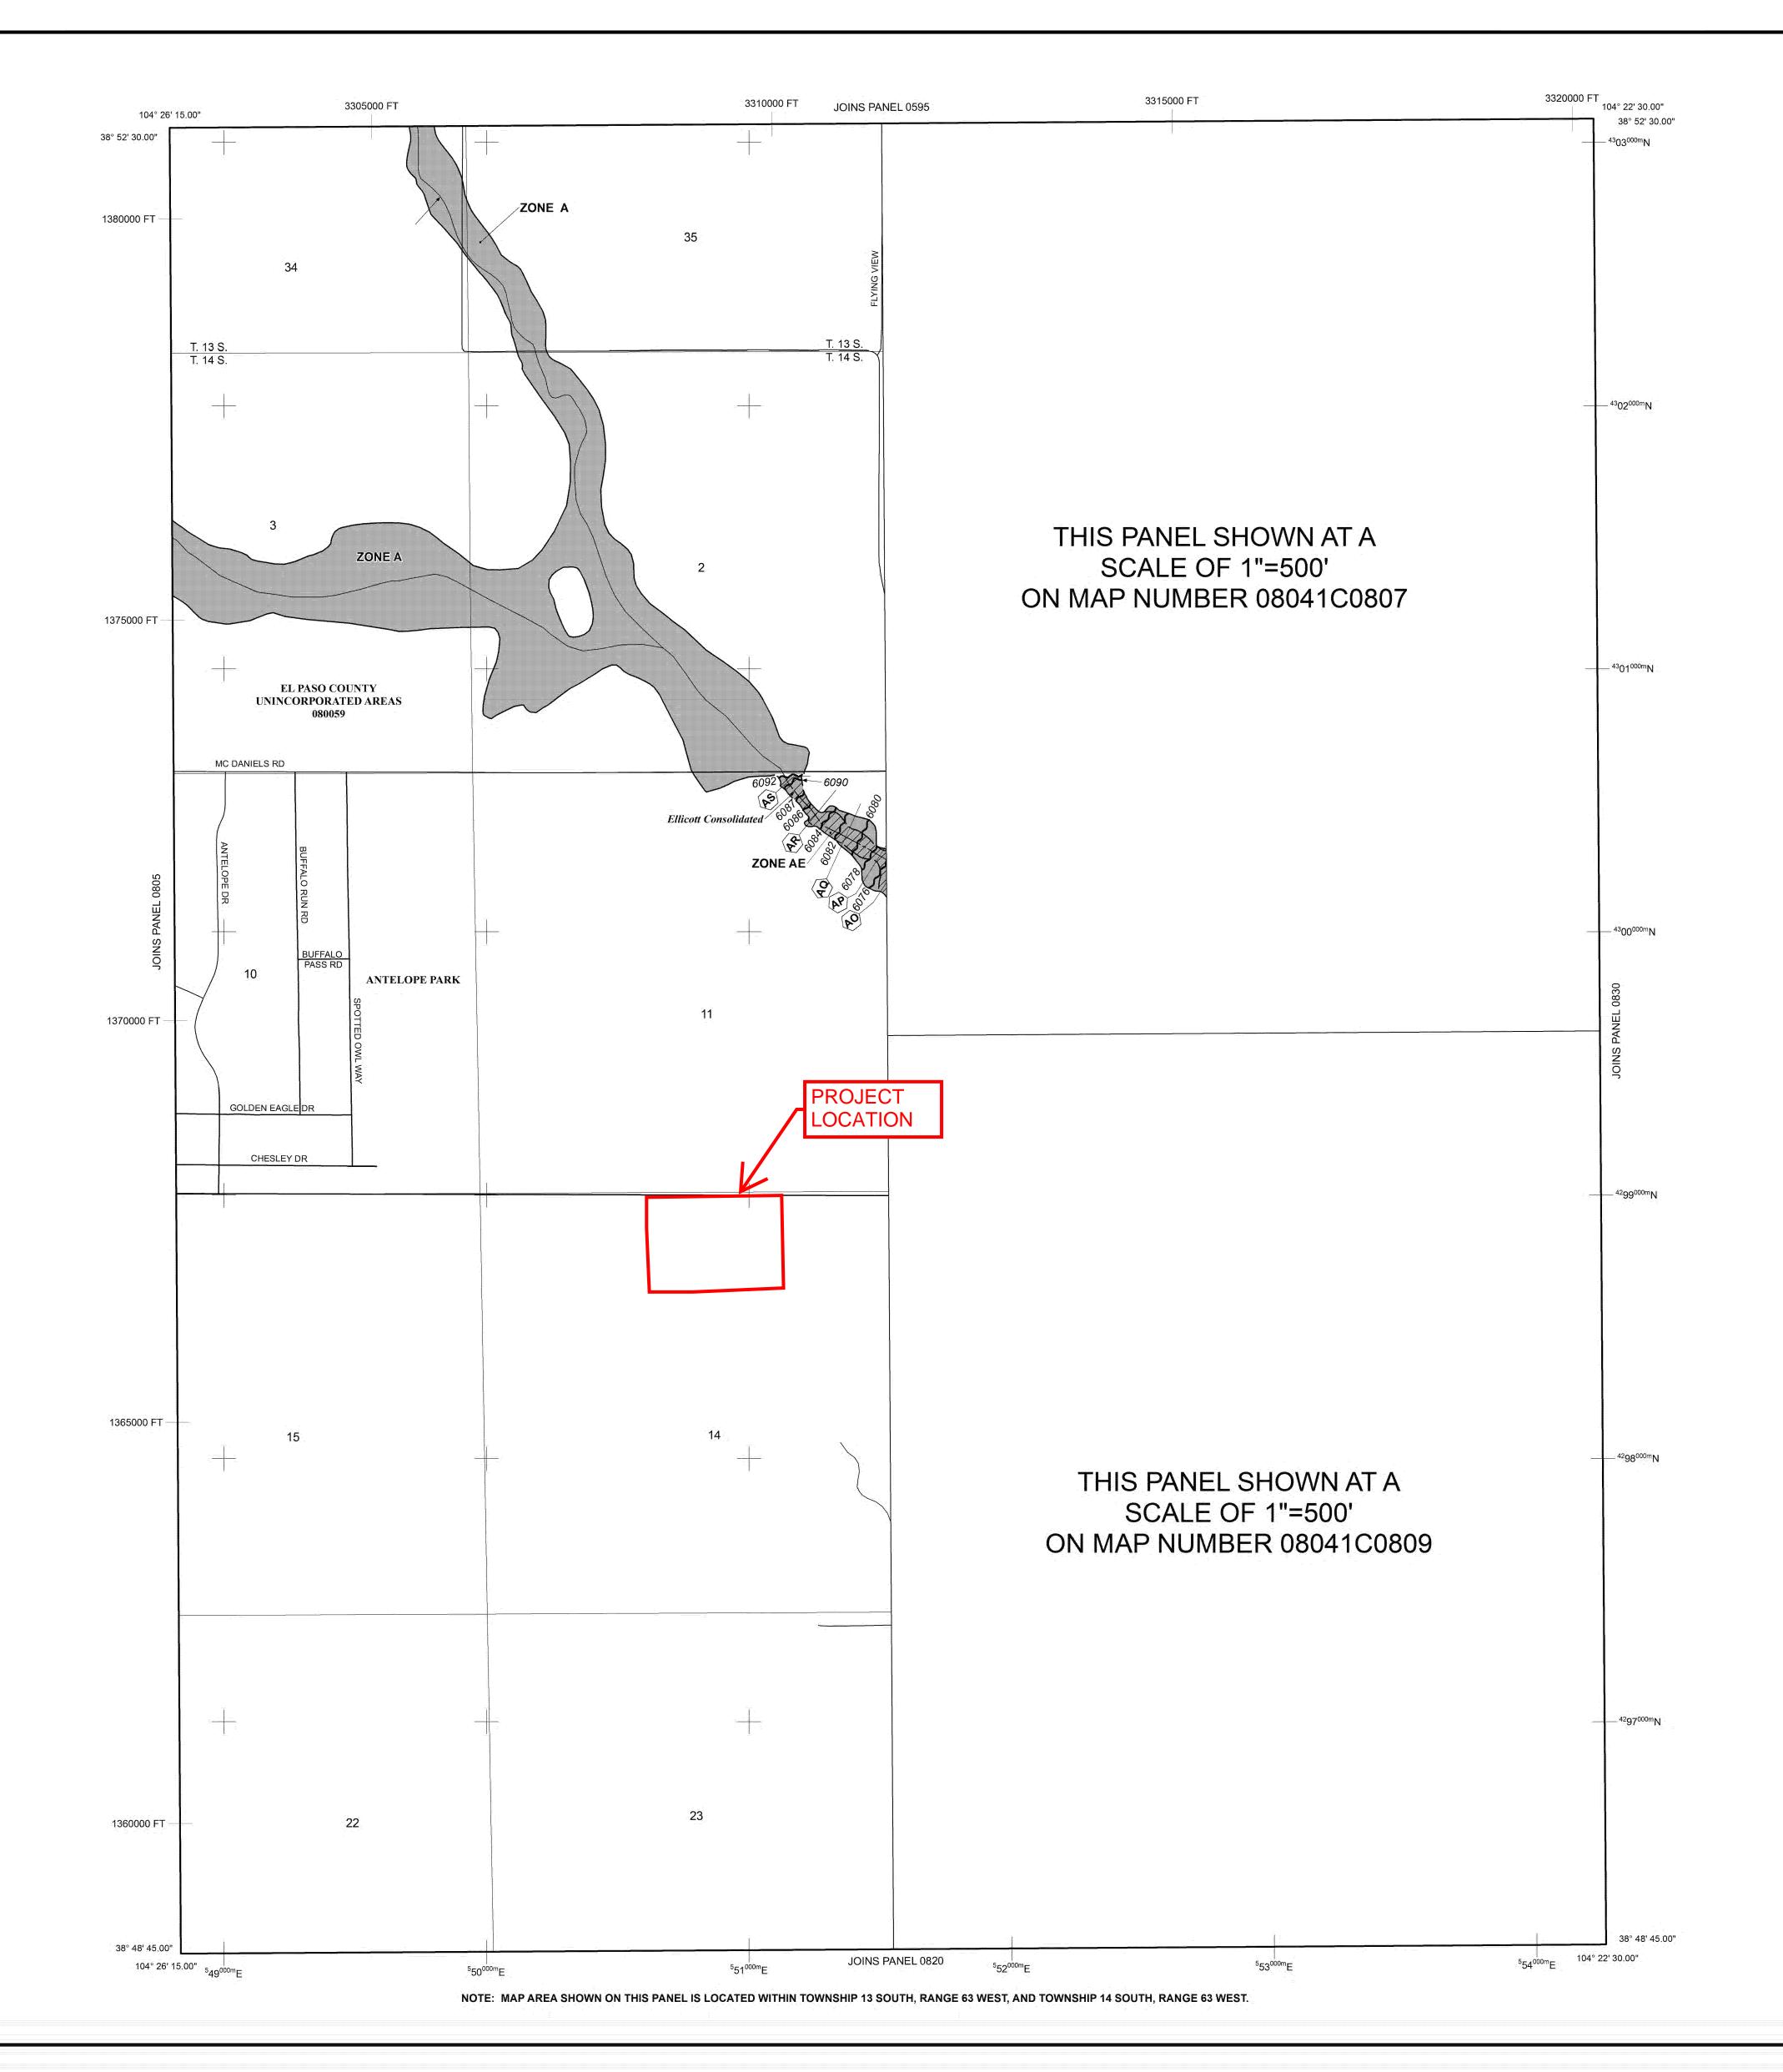

REFER TO SECTION 3.3 OF THE EL PASO COUNTY FLOOD INSURANCE STUDY FOR STREAM BY STREAM VERTICAL DATUM CONVERSION INFORMATION

This Digital Flood Insurance Rate Map (DFIRM) was produced through a Cooperating Technical Partner (CTP) agreement between the State of Colorado Water Conservation Board (CWCB) and the Federal Emergency Management Agency (FEMA).

Additional Flood Hazard information and resources are available from local communities and the Colorado Water Conservation Board.

LEGEND

SPECIAL FLOOD HAZARD AREAS (SFHAS) SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD

The 1% annual chance flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the water-surface elevation of the 1% annual chance flood.

ZONE A No Base Flood Elevations determined. **ZONE AE** Base Flood Elevations determined.

Flood depths of 1 to 3 feet (usually areas of ponding); Base Flood Elevations determined

ZONE AO Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also

ZONE AR Special Flood Hazard Area Formerly protected from the 1% annual chance flood by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood.

ZONE A99 Area to be protected from 1% annual chance flood by a Federal flood protection system under construction; no Base Flood Elevations

Coastal flood zone with velocity hazard (wave action); no Base Flood ZONE V Elevations determined. ZONE VE Coastal flood zone with velocity hazard (wave action); Base Flood

FLOODWAY AREAS IN ZONE AE

Elevations determined.

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

OTHER FLOOD AREAS

Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1

square mile; and areas protected by levees from 1% annual chance flood.

OTHER AREAS

Areas determined to be outside the 0.2% annual chance floodplain.

Areas in which flood hazards are undetermined, but possible.

COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS

OTHERWISE PROTECTED AREAS (OPAs) CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard Areas.

FINAL DRAINAGE REPORT

FOR

MAYBERRY, COLORADO SPRINGS - FILING NO. 3

PREPARED FOR:

COLORADO SPRINGS MAYBERRY, LLC 3296 DEVINE HEIGHTS #208 COLORADO SPRINGS, CO 80922

PREPARED BY:

R & R ENGINEERS - SURVEYORS, INC. 1635 W. 13TH AVE, SUITE 310 DENVER, CO 80204 CONTACT: CLIF DAYTON, P.E. (303) 753-6730

> R&R JOB #MC22110 EPC PROJECT NO. SF2219

ORIGINAL SUBMITTAL: MAY 2022 2ND SUBMITTAL: SEPTEMBER 2022 3RD SUBMITTAL: JANUARY 2023 4TH SUBMITTAL: APRIL 2023

ENGINEER'S STATEMENT:

The attached drainage plan and report were prepared under my direction and supervision and are correct to the best of my knowledge and belief. Said drainage report has been prepared according to the criteria established by the County for drainage reports and said report is in conformity with the master plan of the drainage basin. I accept responsibility for liability caused by negligent acts, errors or omissions on my part in preparing this report.

SIGNATURE:

Clif Dayton, P.E.

Registered Professional Engineer State of Colorado No. 51674

DEVELOPER'S STATEMENT:

I, the developer, have read and will comply with all of the requirements specified in this drainage report and plan.

SIGNATURE:

John Mick

Colorado Springs Mayberry, LLC 3296 Devine Heights #208 Colorado Springs, CO 80922

EL PASO COUNTY'S STATEMENT:

Filed in accordance with the requirements of the El Paso County Land Development Code, Drainage Criteria Manual, Volumes 1 and 2, and Engineering Criteria Manual as amended.

Approved

El Paso County Department of Public Works on behalf of Elizabeth Nijkamp, Deputy County Enginee

SIGNATURE:

Joshua Palmer, P.E.
County Engineer/ECM Administrator

MAYBERRY – FILING 3 FINAL DRAINAGE REPORT

respectively.

Sub-basin C2.5 is a 9.61 acre onsite area that is collected by a curb inlet in Mayberry Drive. This basin consists of single family lots and a portion of Solaire Loop, Galveston Terrace, Cattlemen Run, Achison Way, and Village Main Street. Runoff from this basin is routed via curb/gutter and crosspans, enters a Type R curb inlet, and is discharged into the piped storm sewer system. The 5 year and 100 year developed peak flows are 14.2 and 34.6 cfs respectively.

Sub-basin C3.0* is a 35.40 acre basin south of the Filing 3 development. The basin was analyzed for future development and assumed to comprise both single family lots and park area. During the interim condition the basin will be undeveloped with part of the basin bypassing Pond D following existing drainage patterns. Once fully developed, the entire basin will ultimately drain to Pond D via future storm sewer improvements. The 5 year and 100 year developed peak flows are 22 and 72.7 cfs respectively.

*C3.0 was also analyzed using an interim condition that represents the runoff patterns prior to development. Under this condition the basin would flow southeast and southwest into Channel C2, ultimately discharging into Pond D. The 5 year and 100 year undeveloped peak flows are 7.4 and 54.4 cfs respectively.

Sub-basin D1.1 is a 1.73 acre basin comprising commercial lots of Filing 2. The basin was analyzed for future development of Filing 2. The developed basin will drain via a swale along the southern Filing 2 boundary and enter the Springs Road storm system via a flared end section. The 5 year and 100 year developed peak flows are 6.7 and 12.2 cfs respectively.

Sub-basin D1.2 is a 2.56 acre basin comprising single family lots and portions of Solaire Loop and Besseyi Way. Runoff from this basin is routed via curb/gutter and crosspans, enters a Type R curb inlet on the south side of Besseyi Way, and is discharged into the piped storm sewer system. The 5 year and 100 year developed peak flows are 3.4 and 8.3 cfs respectively.

Sub-basin D1.3 is a 2.02 acre basin comprising single family lots and portions of Union Pacific Way and El Reno Way. Runoff from this basin is routed via curb/gutter and crosspans, enters a Type R curb inlet on the north side of El Reno Way, and is discharged into the piped storm sewer system. The 5 year and 100 year developed peak flows are 3.1 and 7.5 cfs respectively.

Sub-basin D1.4 is a 3.75 acre basin comprising single family lots and portions of Besseyi Way, Union Pacific Way, Springs Road and El Reno Way. Runoff from this basin is routed via curb/gutter and crosspans, enters a Type R curb inlet on the south side of El Reno Way, and is discharged into the piped storm sewer system. The 5 year and 100 year developed peak flows are 5.4 and 12.7 cfs respectively.

MAYBERRY – FILING 3 FINAL DRAINAGE REPORT

Filing 3 and the future Type R inlet will discharge to the main storm sewer system via this stub. The 5 year and 100 year developed peak flows are 3.3 and 8.0 cfs respectively.

Sub-basin D1.11 is a 1.23 acre onsite area that will not be fully developed until future phases. In the future the basin will be collected by a curb inlet on the south side of Mayberry Drive. This basin consists of the south section of the Mayberry Drive ROW. Runoff from this basin will be routed via curb/gutter, enter a Type R curb inlet, and will be discharged into the piped storm sewer system. A stub will be installed during Filing 3 and the future Type R inlet will discharge to the main storm sewer system via this stub. The 5 year and 100 year developed peak flows are 4 and 7.7 cfs respectively.

Sub-basin D1.12 is a 3.42 acre basin comprising single family lots and portions of Cattlemen Run, Solaire Loop, and Besseyi Way. The basin drains via curb and gutter to a Type R inlet on the north side of Besseyi Way. The 5 year and 100 year developed peak flows are 3.8 and 9.3 cfs respectively.

Sub-basin D1.13 is a 3.07 acre basin comprising commercial lots of Filing 2. The basin was analyzed for future development of Filing 2. The developed basin will drain into a future road's curb and gutter system and enter the Springs Road storm system via a Type R inlet within Springs Road. The 5 year and 100 year developed peak flows are 10.9 and 19.9 cfs respectively.

Sub-basin D1.14 is a 0.91 acre basin comprising both single family lots and the southeast commercial lots of Filing 2. The basin was analyzed for future development of Filing 2. The basin drains via curb and gutter to a Type R inlet on the north side of Besseyi Way. The 5 year and 100 year developed peak flows are 1.8 and 3.9 cfs respectively.

Sub-basin D2.0* is a 11.90 acre basin south of the Filing 3 development. The basin was analyzed for future development and assumed to comprise both single family lots and park area. The basin will ultimately drain to Pond D via future storm sewer improvements. The 5 year and 100 year developed peak flows are 10.3 and 27.7 cfs respectively.

***D3.0** was also analyzed using an interim condition that represents the runoff patterns prior to development. Under this condition the basin would flow southeast into Channel D, ultimately discharging into Pond D. The 5 year and 100 year undeveloped peak flows are 2.4 and 17.9 cfs respectively.

Sub-basin D2.1 is a 3.15 acre basin south of the Filing 3 development. The basin comprises the area around Detention Pond D. The basin will ultimately surface flow. The 5 year and 100 year developed peak flows are 0.9 and 6.6 cfs respectively.
