## APPENDIX

- Level of Service Definitions
- Traffic Count Data Sheets
- Intersection Capacity Worksheets

-Indicate if the MTCP shows any improvements in the 2040 or preservation requirements for the 2060 build out years.

-Address intersection spacing

-Address any school routes through the site, as it is adjacent to a school.

-Discuss any potential projects in the area (Northbay at Woodmoor (PUDSP228) & Waterside (PUDSP229))

-Indicate if any deviations are needed

-Provide for analysis for Deer Creek/Woodmoor intersection. Improvements are planned there for County Project. Need to show how much traffic this project will contribute to this intersection. Escrow may need to be provided based on traffic impacts. Contact John Lantz (johnlantz@elpasoco.com or 719-520-6863) at EPC Capital Improvements Projects for more information on this project.

-Include analysis and discussion on how this project will impact/work with school traffic.

-Include discussion for Woodmoor at SH105. Is there a large enough traffic increase or improvements needed to warrant a CDOT access permit?

The assessor's site shows the lot having 10 acres. Please revise.

## THE ROCK COMMERCE CENTER

## TRAFFIC IMPACT STUDY

### 1.0 INTRODUCTION

The Fox Tuttle Transportation Group has prepared this traffic impact study for the proposed The Rock Commerce Center project in El Paso County, Colorado. The currently vacant ± 15.2 acre site is located along Monument Hill Road to the east of I-25. The project proposes to construct a warehouse building with limited retail showroom space.

The purpose of this study is to assist in identifying potential traffic impacts within the study area as a result of this project. Per the El Paso County Transportation Impact Study (TIS) Guidelines, this project requires a Full, Individual Site TIS. The traffic study addresses existing and short-term buildout peak hour intersection and roadway conditions in the study area with and without the project generated traffic. The information contained in this study is anticipated to be used by El Paso County in identifying any intersection or roadway deficiencies and potential improvements for the future conditions. This study focuses on the weekday AM and PM peak hours which represent the periods of highest trip generation for the proposed uses and adjacent roadway traffic. It also includes an evaluation of roadway capacity needs, auxiliary lane requirements, and intersection traffic controls.

### 2.0 PROJECT DESCRIPTION

Per ECM B.2.2 the traffic study shall include the long-range horizon (20-25 years out).

The Rock Commerce Center project proposes constructing a 163,800 square foot warehouse building with some retail showroom space on the currently vacant site. A surface parking lot will have 230 parking stalls.

Vehicle access to the site is proposed via two driveways to Monument Hill Road and a third access to Base Camp Road. Monument Hill Road is classified as a Rural Minor Collector. Base Camp Road is classified as a Rural Local Roadway. Neither roadway has separate pedestrian or bicycle facilities, and The Rock Commerce Center does not propose to add pedestrian or bicycle facilities.

A vicinity map is shown on **Figure 1**. The concept site and access plan is provided on **Figure 2** (note that the site plan is subject to change as the project is still in design/development).

### 3.0 STUDY CONSIDERATIONS

#### 3.1 Data Collection

Intersection turning movement and daily roadway volumes were collected for this project in June 2023. The existing traffic volumes, lane configuration and traffic control are illustrated on **Figure 3**. Count data sheets are provided in the **Appendix**.

### 3.2 Evaluation Methodology

The traffic operations analysis addressed the signalized and unsignalized intersection operations using the procedures and methodologies set forth by the *Highway Capacity Manual*<sup>1</sup> (HCM). Existing peak hour factors were applied to the intersections for the existing and future scenarios. Study intersections were evaluated using Synchro (v11) software.

### 3.3 Level of Service Definitions

A level of service analysis was conducted to determine the existing and future performance of the study area intersections and to determine the most appropriate traffic controls and need for any other roadway or intersection improvements.

To measure and describe the operational status of the study intersections, transportation engineers and planners commonly use a grading system referred to as "Level of Service" (LOS) that is defined by the HCM. LOS characterizes the operational conditions of an intersection's traffic flow, ranging from LOS A (indicating very good, free flow operations) and LOS F (indicating congested and sometimes oversaturated conditions). These grades represent the perspective of drivers and are an indication of the comfort and convenience associated with traveling through the intersections. The intersection LOS is represented as a delay in seconds per vehicle for the intersection as a whole and for each turning movement. A more detailed discussion of LOS methodology is contained in the **Appendix** for reference.

Typically, the desired standard for overall intersection performance is LOS D or better. Individual movements may be allowed to fall to LOS E/F depending on the circumstances, such as a low-volume side street approach to a major arterial or a protected-only left-turn on a major arterial.

## 4.0 EXISTING CONDITIONS

### 4.1 Roadways

The study area boundaries are based on the amount of traffic to be generated by the project and potential impact to the existing roadway network. Conversations with County staff informed the intersections included in this study. The primary public roadways that serve the project site are discussed in the following text and illustrated on **Figure 1**.

**Monument Hill Road** is a two-lane, Rural Minor Collector roadway on the west edge of the site. Monument Hill Road runs north/south roughly parallel to I-25. Turning movements at intersections and major access points are provided via a center turn lane. The posted speed limit is 45 miles per hour (mph) within the study area. There are no

---

<sup>1</sup> [Highway Capacity Manual](#), Highway Research Board Special Report 209, Transportation Research Board, National Research Council, 6<sup>th</sup> Edition (2016).

existing sidewalks along Monument Hill Road. The intersections on Monument Hill Road are all side-street stop-controlled in the project vicinity.

**Palmer Divide Road** is a two-lane, Rural Minor Arterial roadway providing east/west connectivity with I-25. The posted speed limit is 35 miles per hour (mph) within the study area. There are no existing sidewalks or bicycle facilities on Palmer Divide Road in the study area. Both I-25 ramp intersections are stop-controlled on the ramp, with no auxiliary turn lanes on Palmer Divide Road.

**Woodmoor Drive** is a north-south, two-lane Rural Minor Collector roadway north of Monument Hill Road with four lanes south of Monument Hill Road. The posted speed limit is 35 mph. There are no bicycle facilities on Woodmoor Drive. Pedestrian connectivity is limited, with sporadic sidewalks along some properties, with some attached and some detached sidewalks. Monument Hill Road is stop-controlled at Woodmoor Drive with a free right turn. The intersection of Woodmoor Drive and SH 105 is signalized.

**SH 105** is an east-west, four-lane ~~Major~~ Arterial roadway in the area. SH 105 provides regional connections to other arterial roadways, as well as to and across I-25. The posted speed limit is 45 mph in the study area. Sidewalk is present on the north side of SH 105, with no on-street bicycle facilities.

**Deer Creek Road** is an east-west, two-lane ~~Local~~ roadway to the south of the project site. The posted speed limit is 30 mph. Deer Creek Road is stop-controlled at Monument Hill Road with dedicated left and right turn lanes at the intersection. There are no sidewalks or bicycle facilities on Deer Creek Road.

**Base Camp Road** is a north-south, two-lane ~~Local~~ roadway to the south of the project site. The speed limit is not posted. Base Camp Road has limited connectivity and provides access to a couple office and warehouse buildings. There are no sidewalks or bicycle facilities on Base Camp Road.

**I-25** is a north-south six-lane interstate freeway in the project vicinity. The posted speed limit is 65 mph. Access from the project site is available via interchanges on Palmer Divide Road and SH 105.

Misty Acres Blvd needs to be included

## 4.2 Intersections

The study area includes five (5) existing intersections that are listed below with the current traffic control and were analyzed for existing and future background year traffic operations:

1. Palmer Divide Road and I-25 Southbound Ramps (side-street stop controlled)
2. Palmer Divide Road and I-25 Northbound Ramps (side-street stop controlled)

- 
- 3. SH 105 and Woodmoor Drive (signalized)
  - 4. Monument Hill Road and Woodmoor Drive (side-street stop controlled)
  - 5. Monument Hill Road and Deer Creek Drive (side-street stop controlled)

The existing lane configuration at each of the study locations is illustrated on **Figure 3**.

Include Misty Acres Blvd & Monument Hill Rd, Deer Creek & Woodmoor, Deer Creek & Base Camp intersections

#### 4.3 Pedestrian and Bicycle

There are no on-street bicycle facilities on any of the study roadways. Pedestrian connectivity within the study area is limited. Few sidewalks exist in the study area, and there is limited continuity between them. The study area is rural in nature and does not have any planned multimodal upgrades identified in the El Paso County 2040 Major Transportation Corridor Plan.

#### 4.4 Transit

There is no transit within one-half mile of the project site. At the south end of the study area, a regional park-and-ride is located northwest of the SH 105 and Woodmoor Drive intersection. The park-and-ride is served by regional routes connecting major destinations along I-25.

#### 4.5 Existing Intersection Capacity Analysis

The existing volumes, lane configuration, and traffic control are illustrated on **Figure 3**. The results of the LOS calculations for the intersections are summarized on **Table 1**. The intersection level of service worksheets and queue reports are attached in the **Appendix**.

All project intersections are shown to be operating at LOS B or better overall in the AM and PM peak hours, with all movements operating at LOS C or better. There are no existing operational issues identified in the study area.

#### 4.6 Existing Intersection Queue Analysis

Intersection queue length analysis for 2023 existing volumes is shown in **Table 1**. The 95<sup>th</sup> percentile queue lengths are within the available storage space for all movements.

### 5.0 CONDITIONS WITH PROJECT DEVELOPMENT

#### 5.1 Trip Generation

The Rock Commerce Center project proposes to develop the currently vacant site with a 163,800 square foot warehouse building with some retail showroom space. In order to estimate the volume of new vehicular trips that will be generated by the project, trip rates contained in the *Institute of*

Please provide intersection capacity analysis for the 2043 year.

The Rock Commerce Center [FT#23046]

For traffic generation state if peak hour factors were used, if so provide the factor. Refer to ECM Appendix B.3.1.B

*Transportation Engineers (ITE) Trip Generation Manual*<sup>2</sup> were applied to estimate the traffic for proposed land uses.

**Given the proposed land uses, ITE trip generation rates for “Warehouse” (#150), and “Shopping Plaza” (#821) were applied to the proposed uses on site.** The trip generation estimates using these rates are summarized on **Table 2**. It is predicted that about 75% of the total project square footage will be used for warehousing and the other 25% will be retail/showroom use. Square footage for estimating trip generation was broken out by these anticipated uses. There is no current use that matches the proposed showroom use, so “Shopping Plaza” was used as the most applicable land use category. It is likely that this trip generation estimate is conservatively high for the proposed use. The project is anticipated to generate 3,431 new daily, 124 new AM peak hour, and 285 new PM peak hour vehicle trips.

Per the El Paso County Engineering Criteria Manual (ECM), the maximum ADT for a rural collector roadway is 1,500 vehicles per day (VPD). Without the proposed development trips, daily traffic on Monument Hill Road is 2,970 VPD. Since Monument Hill Road already exceeds the volume threshold for the current roadway classification (based on June 2023 data – without Palmer Ridge High School in session), the project-added trips do not result in a change in roadway classification.

## 5.2 Trip Distribution and Assignment

Please discuss if pass-by trips were taken in account for the trip generation calculations.

The estimated trip volumes were distributed onto the study area street network based on existing traffic characteristics, land uses, and traffic patterns in the area. **Figure 4** summarizes the trip distribution assumptions.

Using these distribution assumptions, the project-added traffic was assigned to the study area roadway network for the weekday AM and PM peak hours. The site-generated volumes are also shown on **Figure 5**. The site-generated volumes were then added to the background traffic to develop the future total traffic volumes, as summarized on **Figure 6**.

## 5.3 Project Build-Out Intersection Capacity Analysis

At Project build-out, all study area intersections operate at overall LOS B or better in the AM and PM peak periods. With the project-added traffic, no movements drop below LOS D. Projected intersection operations are acceptable with the added project trips.

Provide turn lane discussion for short and long term scenarios.  
Are existing lengths adequate or will they need to be revised?

<sup>2</sup> *Trip Generation 11<sup>th</sup> Edition*, Institute of Transportation Engineers, 2021.

## 5.4 Project Build-Out Intersection Queue Analysis

No movements have queues exceeding storage length in the AM or PM peak hours with the project-generated trips added.

## 5.5 Site Accesses

State what the sight distances are and what the required distance per the ECM is for each proposed access.

Both site access points to Monument Hill Road are proposed to be side-street stop-controlled intersections. The site access points adhere to appropriate intersection spacing for Rural Collector roadways as defined in the ECM Table 2.5, as noted on **Figure 2**. Sight distance for both access points meet or exceed the required minimum distance defined in the ECM.

Per the El Paso County Engineering Criteria Manual Section 2.3.7.D.1 and 2.3.7.D.2, for a minor arterial or lesser classification, left-turn deceleration lanes would be required where left-turn volumes are 25 vehicles per hour (VPH) or greater and right-turn lanes where right-turn volumes are 50 VPH or greater. Based on the trip generation and access volume projections for buildout, the only turn deceleration lane required is for northbound right turns at the north access. Per Table 2-24 of the ECM, the turn lane should be 235' long with a 200' taper length.

Both site access points are estimated to operate acceptably with LOS A overall for both AM and PM peak hours. All movements operate at LOS B or better for both peak hours. Maximum queues of 1 vehicle are expected at both access intersections. Calculated delays, LOS and queues for access intersections are shown in **Table 1**.

Please state what VPH is for each access and turn.

## 6.0 CONCLUSIONS

Provide accident history within the study area and impact to/from the development. If there is no accident data available please state so.

The Rock Commerce Center project proposes to construct a 163,800 square foot warehouse building with some retail showroom space on the currently vacant site. A surface parking lot will have 230 parking stalls. This traffic study addresses existing and site-build out intersection and roadway conditions in the study area.

The project is anticipated to generate 3,431 new daily, 124 new AM peak hour, and 285 new PM peak hour trips at full buildout. Two full-movement site access points are proposed to Monument Hill Road.

**Based on this analysis, project-generated trips can be successfully accommodated in the existing network.** Per ECM Appendix B.8 state what the applicable road impact fees are and time of payment.

Provide a section or table on recommended improvements. Please discuss if signalization of intersections is anticipated at completion of the project and within the 20 year lookout.

*Level of Service Definitions*

*Traffic Count Data Sheets*

*Intersection Capacity Worksheets*

## ***Level of Service Definitions***

## LEVEL OF SERVICE (LOS) DEFINITIONS

In rating roadway and intersection operating conditions with existing or future traffic volumes, "Levels of Service" (LOS) A through F are used, with LOS A indicating very good operation and LOS F indicating poor operation. Levels of service at signalized and unsignalized intersections are closely associated with vehicle delays experienced in seconds per vehicle. More complete level of service definitions and delay data for signal and stop sign controlled intersections are contained in the following table for reference.

Level of Service Rating	Delay in seconds per vehicle*		Definition
	Signalized	Unsignalized	
A	0.0 to 10.0	0.0 to 10.0	Low vehicular traffic volumes; primarily free flow operations. Density is low and vehicles can freely maneuver within the traffic stream. Drivers can maintain their desired speeds with little or no delay.
B	10.1 to 20.0	10.1 to 15.0	Stable vehicular traffic volume flow with potential for some restriction of operating speeds due to traffic conditions. Vehicle maneuvering is only slightly restricted. The stopped delays are not bothersome, and drivers are not subject to appreciable tension.
C	20.1 to 35.0	15.1 to 25.0	Stable traffic operations, however, the ability for vehicles to maneuver is more restricted by the increase in traffic volumes. Relatively satisfactory operating speeds prevail, but adverse signal coordination or longer vehicle queues cause delays along the corridor.
D	35.1 to 55.0	25.1 to 35.0	Approaching unstable vehicular traffic flow where small increases in volume could cause substantial delays. Most drivers are restricted in ability to maneuver and selection of travel speeds due to congestion. Driver comfort and convenience are low, but tolerable.
E	55.1 to 80.0	35.1 to 50.0	Traffic operations characterized by significant approach delays and average travel speeds of one-half to one-third the free flow speed. Vehicular flow is unstable and there is potential for stoppages of brief duration. High signal density, extensive vehicle queuing, or corridor signal progression/timing are the typical causes of vehicle delays at signalized corridors.
F	> 80.0	> 50.0	Forced vehicular traffic flow and operations with high approach delays at critical intersections. Vehicle speeds are reduced substantially and stoppages may occur for short or long periods of time because of downstream congestion.

\* Delay ranges based on 2010 Highway Capacity Manual Criteria
